The Independent

VOL. LXXI. NEW YORK, THURSDAY, JULY 6, 1911. No. 3266

# Survey of the World

**New Trust Prosecutions**

Eighty-three men, officers of wire manufacturing companies that were parties, some years ago, to pooling agreements, were indicted by a Federal Grand jury, in New York, last week, for violation of the Sherman act. Two subsidiaries of the Steel Corporation—the American Steel and Wire Company and the Trenton Iron Works—are involved, and thirty-five other corporations or partnerships are represented. Among the indicted are Herbert L. Satterlee, son-in-law of J. Pierpont Morgan and president of a wire company; Frank J. Gould, president of a nail company; Charles F. Brooker, Connecticut's member of the Republican National Committee, to whom a prominent university has just given an honorary degree; William J. Palmer, president of the American Steel and Wire Company; Erskine Hewitt, grandson of Peter Cooper, and Ferdinand W. Roebling, of the Roebling Construction Company. There were nine pools or associations. Their names follow, with the percentage of the industry which each controlled: Fine Wire Magnet, 85; Underground Power Cable, 95; Horseshoe Manufacturers, 70; Bare Copper Wire, 95; Telephone Cable, 80; Rubber Covered Wire, 80; Lead Encased Cable, 80; Wire Rope, 80; Weatherproof and Magnet Wire, 90. Edwin E. Jackson, Jr., promoter and supervisor of the pools, is indicted in connection with each of the nine groups. The defendants say that the pools were dissolved some time ago because of advice from Washington that they existed in violation of the Sherman act; that one was ended in 1908, that seven were given up in 1909, and that one lasted until the beginning of 1910. ——In February, 1910, a combination of boxboard paper makers was prosecuted. There were about thirty defendants. They pleaded guilty and were fined $2,000 apiece. The Government says that the combination was renewed, and therefore, in New York last week, the boxboard paper makers who are members of the Eastern Boxboard Club —twenty-one officers of nineteen companies—were indicted. It is understood that the Government, in case of conviction, will ask for jail sentences.——The Periodical Clearing House, and firms and persons connected with it, have been sued by the Government under the Sherman act. The Clearing House is an association formed by the publishers of a considerable number of magazines. Among the defendants in this proceeding are Harper & Brothers, the Ridgeway Company, the S. S. McClure Company, Butterick's Publishing Company and the Review of Reviews Company. Frank N. Doubleday, of Doubleday, Page & Co., is a director of the Clearing House. It is charged by the Government that the association was formed to prevent competition on subscription rates. Defendants say that its purpose was simply to maintain equitable conditions at subscription agencies; that they asked the Government for an opinion as to its legality, and that the Department of Justice, having examined all the association's papers and plans, gave assurance that there was no violation of law.——It is expected that the Government will appeal to the Supreme Court from the recent decision upholding the Harriman railroad merger. ——The inquiry by a House committee concerning the Sugar Trust has brought up much ancient history. Last week the chief witness was George H. Earle, who told again the story of the suppression

of Segal's refinery in Philadelphia, attacking President Roosevelt and Attorney General Bonaparte for declining to sue the Trust on account of that transaction.——The first of the three parts of Commissioner Herbert Knox Smith's report on the United States Steel Corporation has been published. It relates mainly to the investment and capitalization. When the combination was formed, in 1901, Mr. Smith says, tangible property worth $682,000,000 was capitalized at $1,402,000,000. At the present time tangible property is $1,187,000,000 and capitalization $1,468,000,000, so that property has been increased by $505,000,000, with a capital increase of only $66,000,000. This part of the report gives a history of the formation of the company, with some reference to conditions which suggested the combination.

**Senator Lorimer**

The Senate committee in charge of the investigation of the charges of bribery in the election of Senator Lorimer remained at work up to the adjournment on Friday until after the Fourth of July. Clarence S. Funk, general manager of the International Harvester Company, testified in support of statements previously made by Mr. McCormick, of the same company. He stated, as he had testified in Illinois, that Edward Hines, of the Hines Lumber Company, came to him shortly after the election of Senator Lorimer and said that it had cost about $100,000 and that he wanted $10,000 from the Harvester Company, and that he, Funk, had refused to give it. After Mr. Kohlsaat, editor of the Chicago *Record-Herald*, had first wormed the fact out of Mr. Funk and had published the story, Mr. Hines came to see Mr. Funk and tried to persuade him that he had misunderstood Mr. Hines's purpose in calling, but Mr. Funk was not to be misled as to what had occurred. Since his previous testimony in Illinois Mr. Funk has been followed by detectives supposed to be set by Mr. Hines or his friends to watch him. Mr. Wirt H. Cook, a Duluth lumberman, testified that he was in a room in Chicago with several other men when Mr. Hines called up Governor Deneen at Springfield and Mr. Cook heard this conversation: "Hello, is that you, Governor Deneen?" Hines said, according to Mr. Cook. "Governor, this is Hines. I am just back from Washington, where I saw President Taft and Senator Aldrich last night. They say that Hopkins must not be re-elected under any circumstances. Lorimer is the man. He must be elected at any cost. You may go as far as you like in putting him over. I'll be down to Springfield on the first train." Hines added that he would go on to Springfield with plenty of money. President Taft has declared that neither Hines nor any other man has any foundation for the statement that he was favoring Lorimer's election. At another session Mr. Hines was put on the stand and said that he had not seen President Taft, but got information of his attitude from Senator Aldrich, and that he had induced Mr. Lorimer to stand for election. Mr. Hines appears to have acted in the interest of protection of lumber, and was quoted as saying that in the election of Mr. Lorimer President Taft had been beaten in his desire for free lumber. It is understood that ex-Senator Aldrich does not admit the truth of Mr. Hines's assertions as to himself, and is ready to go to Washington to testify.——The breadth of the investigation by the Senate committee may be widened, as the charge is made that Senator Stevenson, of Wisconsin, who was so long the backer of Senator LaFollette before they separated, has been charged with gaining his election by bribery. His case has already been before the Wisconsin Legislature in both branches, and, while the report of the joint committee alleges no specific instance of corruption or violation of law, the State Senate, thru its special committee, declared his election had been brought about by corruption. It was charged that $107,000 had been expended in the campaign. Friends of Mr. Stephenson admitted that he had been a liberal spender in his own campaigns, as he had been previously in behalf of his colleague, Mr. LaFollette, but that all the money went for legitimate purposes.

**A Lynching Judge**

The lynching of "Tom" Allen and "Joe" Watts, negroes, in Walton County, Georgia, on June 27, is creating unusual attention in Georgia

because of the question of responsibility for the failure to protect the prisoners. "Joe" Watts had been charged with assaulting a woman some six weeks before and had been protected by troops when brought for trial at Monroe before Judge Brand. The judge was offended because troops were sent, and refused to try the case then, and the prisoner was sent back to Atlanta for protection. When the judge was ready to try the prisoner he sent for him. Governor Brown had heard that there would be a lynching and wrote to both the judge and the sheriff asking if they desired military protection. Judge Brand replied that he did not, that it was not needed. The prisoner was then sent with three officers, but at a station in the country the train was met by 300 masked men, the negro taken from the officers, and hung to a telegraph pole and shot to death. To the very end he denied that he was guilty. When severe criticism was made of the authorities for allowing the lynching to take place Governor Brown told the whole story of his correspondence, saying that under the law he had no authority to send the military unless asked for, and that he had suggested it, but his offer was declined. The sheriff, with apparent justice, says that it was the judge's prior business to ask for troops. Judge Brand appears to accept the responsibility. He said the next day:

"While I want to discharge every duty which the law imposes upon me, I don't propose to be the engine of sacrificing any white man's life for all the negro rapists in the country by assuming a responsibility that the law does not impose upon me. In taking this position I am in perfect accord with my conscience and my God. I would not imperil the life of one white man to save the lives of a hundred negro rapists.

"If I had called the military and some young men among the soldiers were killed or some of the citizens of Walton county were killed I would never forgive myself."

There is likely to be an investigation of the case by the legislature, and it is thought that Judge Brand will be impeached. While hot with the excitement of the first lynching the mob went to the local jail and took out and lynched a second negro who was charged with loitering suspiciously about a house. —There has been a race riot in Randolph County, W. Va., between American and Italian miners, and three Italians were mortally wounded and one American.

**Reciprocity**

The campaign against reciprocity carried on by R. L. Borden in the western Provinces of Canada seems to have been a failure. He was told that the people of Alberta and Saskatchewan are a unit in its favor, as shown by the action of the legislative assembles and the boards of trade. In Manitoba he found the same feeling predominant. In our own Senate the Root amendment to the reciprocity bill was defeated without a division. The amendment proposed to delay the free admission of wood pulp and print paper into this country until all restrictions against the exportation of these products had been removed by the Canadian Provinces. Under the terms of the bill in its present form pulp and print paper will be admitted free from all Provinces except those that maintain export restrictions. An attempt made by Senator Penrose to set July 26 as the day to vote on reciprocity, and July 27 for the wool revision bill, failed of unanimous consent, but it was expected when the Senate took a recess on Friday that a vote would be had before the end of the month.

**Triumphs of Aviation**

Downtown people in New York City were surprised on Saturday to see an aeroplane circling over the skyscrapers near the Singer tower. It was a Burgess-Wright biplane navigated by Harry M. Atwood, who had flown from Boston to New London with a passenger on the previous day to see the Yale-Harvard boat race from above. In the morning he started from New London for Mineola, L. I., but concluded to go on to New York while he was about it. He dropped into a field at Astoria on the East River to get some more gasoline and to inquire the way to Governor's Island. Then he proceeded down over the bridges and ferryboats and took a turn over the town, a feat that had never been attempted before for fear of the eddying air currents rising from the building canyons. Landing on Governor's Island, he was met by Lieutenant

picked and took him on a spin over the bay. This beats the record for cross-country flights in America, for the distance traveled between Boston and New York was at least 275 miles. Atwood is a graduate of the Massachusetts Institute of Technology, twenty-five years old. He has only been flying a month, but has done about 2,000 miles in the air in that time. He is now planning a flight from Atlantic to Pacific, which he expects to make during the summer.——The International Cup donated by James Gordon Bennett, which was taken from France to America in 1909 by Curtiss and taken from America to England by Grahame-White last summer, was recaptured for America by Charles T. Weymann, the only American aviator competing at Eastchurch, England. He made 94 miles at an average rate of 78 miles an hour, using a Nieuport monoplane with a 100 horse power Gnome motor.——Vedrines was the first of the competitors in the Paris-Brussels-London race to cross the English Channel at Calais. Ten other aeroplanes followed him on Monday.——The first hydro-aeroplane built for the United States Government made a satisfactory trial flight on Lake Keuka with Lieutenant Ellyson as pilot. He dropped to the water repeatedly and rose without difficulty.

**Peace in Mexico**

There was peace, last week, in nearly every part of Mexico. Madero issued an address to the people. He promised equitable taxation, and said Governors would be asked to place the greater part of the tax burden upon the large landholders. Foreign capital would be protected, but he hoped that foreign capitalists would not, as in the past, seek to influence the authorities in favor of special privileges. Such efforts would be made in vain. The acts of the Diaz Government, he continued, were to be investigated; for wrongs a remedy would be found, and the guilty would be punished. He urged his troops to treat the Federal soldiers as brothers; they had really been in sympathy with the revolutionists. He asked for the assistance of the press, but said he should look with suspicion upon any paper that approved his every act. In his honor there was last week a battle of flowers in the capital. The procession was several miles long, and perfect order was preserved.——Political parties are forming, and it is expected that one of them will urge General Reyes to be a candidate. Nicolas Miranda, whose candidacy is announced, proposes a long platform. Part of it calls for a pedagogical congress to devise measures for the cure of illiteracy.——To better the condition of workingmen, the Government will create a labor commission, which will consider wages, housing and peonage.——Our Government withdrew from the body of troops in Texas at the end of last week five regiments.——Owing to the surrender or disappearance of the Magonistas, only 200 soldiers were sent to Lower California.——It is reported that the oil interests of Sir Weetman Pearson have been bought, for $18,000,000, by John W. Gates's Texas oil company.——Claims for $250,000 have been laid before the Mexican Government by the citizens of Douglas, Ariz., because of losses suffered at the time of the battle of Agua Prieta.——Not until last week did the Federal forces under Col. Manuel Reyes, at Chinapas, in Southern Chihuahua, lay down their arms. They believed that the report about Diaz's resignation was false.

**British Politics**

Immediately after the coronation Parliament plunged again into the fight over the constitutional question with renewed energy and the same bitterness. The Lords are determined to attempt to amend the veto bill passed by the House of Commons, and on the first division in the Upper House the Government was defeated by a vote of 192 to 48. This amendment was presented by Lord Cromer and intended to prevent the passage over the veto of the Lords of social, industrial and land legislation in the guise of financial measures. According to the veto bill as passed by the Lower House, the Speaker of the House has the right to decide what bills are money bills, and as such outside the power of the Lords. The amendment substitutes for the Speaker a joint com-

THE CORONATION PROCESSION

The King and Queen in the carriage of state passing thru the Admiralty Arch at the entrance of the Mall leading to Buckingham Palace.

mittee of seven members from each house. The next amendment to be taken up will be Lord Lansdowne's. One of these excludes from the operation of the law any measure affecting the prerogatives of the Crown, the right of succession to the throne, or the establishment in any part of the United Kingdom of a separate legislature. This is designed to prevent Home Rule in Ireland. A second Lansdowne amendment requires that in the case of all issues of importance on which the sentiment of the country has not been sufficiently ascertained, the bills shall be submitted to a popular referendum. It is not expected that the Government will consent to any important changes in the veto bills, but its plans for meeting the emergency have not yet been disclosed. Even the Conservatives admit that in the event of an election now the Liberals would come back with an increased majority. But neither party wants to precipitate another election so soon.——The Declaration of London, defining neutrality and contraband of war, which was drawn up by the representatives of the Powers two years ago, in accordance with a resolution of The Hague Conference, is still meeting with opposition in England, notwithstanding the fact that it is supported by the Government and was approved by the Imperial Conference. The admirals of the British navy have come out against it, declaring it may easily bring about "the resurrection of piracy in its most dangerous forms," and at a large meeting in London composed of representatives of chambers of commerce, members of Parliament and naval officers, a resolution was passed to the effect that the Declaration of London concerning the laws of naval warfare most seriously weakened the naval position of the British Empire, was highly prejudicial to its commercial interests, and gravely threatened the food supply of these islands in time of

war. Mr. Balfour, in support of the resolution which he presented, argued from the point of view that "starvation, not invasion, is the danger of this country." He asserted that under the Declaration of London a weak naval power could convert merchantmen into privateers and sink every neutral ship carrying grain to the starving millions in Great Britain without anything to deter them except the possibility that some two or three years after they had starved this country into submission an international tribunal might mulct them for damages. Rudyard Kipling has published a poem denouncing the Government for taking advantage of the good feeling of the coronation time to force thru a measure so shameful and dangerous to the nation. The following are two of its stanzas:

The light is still in our eyes
  Of faith and gentlehood,
Of service and sacrifice,
  And it does not match our mood
To turn so soon to your sophistries
  That starve our land of her food.

Wait till the money goes!
  Wait till the visions fade!
We may betray in time, God knows;
  But we would not have it said,
When you make report to our scornful foes,
  That we kissed as we betrayed.

**The Shipping Strike**

In English ports, especially Liverpool and Hull, the strike has become more serious during the week in spite of the concessions in regard to wages made by the steamship companies. The seamen and firemen have been granted increases in wages by all the trans-Atlantic lines, but when they returned to work they left again because the dockers who struck in sympathy with them were not satisfied. The dockers demand recognition of the union, the discharge of non-union men, and a guarantee that the rise in wages shall not be temporary. Compromises negotiated by the representatives of the strikers have been repudiated at mass meetings of the men, and spontaneous and unauthorized strikes have repeatedly occurred. At Liverpool, on the 28th, the crew of the "Empress of Britain" deserted in support of the shore men, and marching along the docks, called out the crews of all the vessels they came to. The 2,000 coal porters of the Cunard Line joined in, and soon the procession numbered 10,000 men. The "Haverford," of the Red Star Line, was ready to start for Philadelphia in an hour when the seamen, firemen and stewards left the ship. The 600 passengers had to be sent to boarding houses, and the mail taken back to the post office. The Red Star "Zeeland," from Boston, was not able to get to the dock, and her passengers were landed from a tender. The White Star "Arabic" was set on fire in six places. Attempts were also made to burn the "Canada." At Hull there are 20,000 men on strike and there has been much rioting. The strikers attacked the "Albert," which has a non-union crew, but being beaten off here by the police, they marched to the offices of the Shipping Federation and the Free Labor organization and smashed windows. Then they raided a graveyard and broke up the tombstones to get missiles to throw at the police. The Shipowners' Federation held a conference, at which it was resolved to establish uniform wages at all the ports at a moderate increase and compensate by a tonnage levy the owners of vessels compelled to lay up on account of a strike. The demand for recognition of the union was refused. The strike is already having a serious effect upon the food supply, for the vessels from the Continent loaded with vegetables, fruit, eggs and butter are not allowed to discharge their cargoes. The mills are stopped on account of shortage of wheat. and flour has risen almost to famine prices. There are twenty-five ships due this week, carrying 108,000 tons of grain, but if the strike holds their cargoes cannot be discharged. At Liverpool on Monday there were about fifty vessels held up, including several transatlantic liners. At Manchester, 8,000 men employed on the ship canal have struck and seventy vessels are tied up in the canal. At Glasgow the three Clyde liners which had been kept in the port succeeded in getting under way on July 1 with the aid of strikebreakers. The seamen and dockers of Glasgow held a street demonstration followed by a mass meeting, at which J. Havelock Wilson, general secretary of the Sea-

men's Union, who made a speech, said they proposed to make it hot in the House of Commons for Winston Churchill, Home Secretary, because a number of ships were allowed to sail without qualified crews, thus endangering the lives of the passengers. He threatened that if the owners do not come to terms the strike will spread to every port in Europe. It is now feared that the Transport Workers' Federation, which includes 100,000 men, will call a general strike in sympathy with the seamen and dockers. If this plan is carried out, British shipping will be seriously crippled.

**The Caillaux Ministry**

M. Joseph Caillaux, Minister of Finance in the Monis Cabinet, was called upon to form a new ministry and has been successful in getting one satisfactory to the Chamber, tho of doubtful permanence. M. Caillaux took the portfolio of the Interior and selected as his colleagues mostly men who had previously served under Clemenceau, Briand or Monis. Théophile Delcassé, who, when he was Foreign Minister, inaugurated the advance movement in Morocco and so brought France to the verge of war with Germany, retains the same position in this Cabinet that he filled in the preceding, that is, Minister of Marine. The Ministry of Foreign Affairs, just now of especial importance, was offered to Raymond Poincaré, but he refused it, so Premier Caillaux chose a new man, Justin G. de Selves, former Prefect of the Department of the Seine, that is, of Paris. When the new Premier reported the formation of his cabinet and outlined his policy to the Chamber of Deputies he received a vote of confidence of 367 to 173. Since the adverse vote which deposed Monis was on a side issue there is no reason why the incoming ministry should not continue the same program. On the most troublesome of the questions with which the former ministry had to deal, the delimitation of the champagne district, Premier Caillaux is content to accept the latest decision of his predecessor, that is, that it is unwise to attempt any delimitation. The income tax bill, of which M. Caillaux is the father, will now be earnestly pushed. It is now held up in the Senate. On the question of proportional representation the new Cabinet is divided and the Premier is necessarily vague, merely promising to search for a project of electoral reform that will suit all republicans. In regard to the railroad question the Premier promises to extend State control and to induce the railroad companies to treat their employees as generously as does the Government on the State-owned lines. Measures would be introduced, he said, to suppress sabotage and the endangering of life and national safety thru the desertion of their posts by railroad men. This last is the most serious matter with which the Government has to deal, for the Syndicalists or militant wing of the labor unionists openly advocate and encourage the various forms of destruction of property or interference with business which go by the name of "sabotage." The railroads in France, ever since the Government supprest the strike, have been notoriously unsafe, chiefly on account of the cutting of the wires controlling the signals and switches. In the last two years there have been 2,268 cases of such wire cutting, sometimes resulting in collisions and derailments. And out of these two thousand cases of malicious mischief there have been only a dozen convictions, and of these six were mere boys. Another trick of the discontented employees of the State railroads, not so dangerous but quite as vexatious, is the mismarking of cars, so that goods are liable to turn up in any quarter of the country instead of their destination. Such practices are regarded by an increasing number of French laboring men as legitimate methods of industrial warfare and find defenders even in the Chamber. The traveling public, however, takes a different view of it, and the recent discovery of a carefully contrived derailment, calculated to wreck on a bridge the express train from Paris to the coast, has strengthened the party of law and order.

**Turkish Difficulties**

The troops engaged in the attempt to suppress the Arabian rebellion in Yemen met

with a severe defeat on June 17, when a Turkish column commanded by Mohammed Ali Pasha was ambushed by the Arabs near Gheesan. A thousand Turkish soldiers were killed and four big guns, two Maxims, 2,000 rifles and a large quantity of ammunition were captured. The survivors fled back to Gheesan, where their losses were increased by the Turkish gunboat, which shelled the town, supposing it to be in the hands of the enemy.——From Albania the news is conflicting. Dispatches from Constantinople report the rebellion as practically quelled and the insurgents ready to submit to the authority of the Sultan. But the news from Austrian and Italian sources tells a contradictory story, that the insurgent movement is spreading thru the country, and that the 50,000 troops which Turkey has concentrated in Northern Albania are devastating the country, burning houses and crops, outraging women and killing prisoners. The Red Cross nurses report that it is impossible to care for the sick and wounded and to keep the refugees who have escaped into Montenegro from starvation. A representative of the Albanian revolutionists is in this country collecting funds for the support of the movement.

**German Intervention in Morocco**

Germany has definitely manifested her intention not to be left out in any prospective partition of Morocco by dispatching the gunboat "Panther" to Agadir or Santa Cruz. This is the most southerly of Moroccan seaports on the Atlantic, about a hundred miles below Mogador. It is reported from Tangier that the German Minister has notified the Moorish Government that Germany has decided to occupy Agadir and the hinterland, but, according to the Paris cables, Ambassador von Schön explained to Foreign Minister de Selves that the "Panther" was merely going to Agadir temporarily at the request of German merchants to afford them protection, and that there was no question of landing troops. M. de Selves exprest his surprise and regret at the action of Germany. Germany, however, has always insisted upon her dominant commercial interests on the Atlantic side of Morocco and only six months ago, when a French warship visited Agadir, a vigorous protest was made in the German press and in the Reichstag on the ground that the act was a violation of the Algeciras convention. Now the newly installed Foreign Minister will have to decide whether France will regard a similar action on the part of Germany as a violation of the convention. At any rate, it is obviously intended as Germany's response to the French occupation of Fez and Mekinez. Agadir has only about 700 inhabitants, but an excellent harbor. Mogador, which the Germans regard also as within their sphere of influence, is a fortified seaport with a population of 15,000. The hinterland is rich and fertile, and on account of its altitude is habitable to Europeans. There are said to be rich copper mines in the interior, but the chief importance of these towns to Germany is that they will afford an Atlantic naval base on the most westerly point of Europe, commanding the British ocean routes to South Africa, India and Australia, and within four days' sail of Brazil, where German emigrants have settled in large numbers. The responsibility for the decision as to what action should be taken to check German aggression rests ultimately upon Great Britain, for it is by her permission that France is in Morocco, and formerly, when the French policy of "peaceful penetration" was interrupted by the visit of the Kaiser's yacht to Tangier, the British navy stood ready, it is believed, to back up France in case of war. The jingo papers of Germany compare the sending of the "Panther" to Agadir to the Ems telegram, which, as worded by Bismarck, precipitated the Franco-Prussian war, and they obviously hope for the same result. The possible attitude of Spain in such an event is a source of anxiety to the French Government, for it would be too much of a strain upon the country to have to defend both frontiers at the same time. Germany and Spain are apparently acting in concert in their simultaneous advance on Morocco, and the Spanish newspapers are jubilant over the German move, because it gives support to the recent seizure by Spain of El Araish and Alkazar.

# Concerning Sea Power

BY DAVID STARR JORDAN

[The president of Leland Stanford, Jr., University is well known as a powerful advocate of the cause of peace. His little book, "The Human Harvest," considering war from the eugenics standpoint, has had a wide circulation and a wider influence.—EDITOR.]

THE purpose of the vast naval expenditures of the world is the development of sea power, as a factor in national strength. For this, most of the nations, little and big, spend more than the cost of all their civil equipment, extravagant as this often is. Its purpose is defined as (1) national defense, (2) the maintenance of peace, (3) marine insurances, the protection of commerce from pirates and belligerents, (4) the circumventing of the wicked schemes of designing nations, (5) the protection or subjugation of alien dependencies, and (6) the control of the sea.

The first item may be regarded as negligible, as fortified towns are impregnable to battleships, unfortified towns are now immune under the rules of war, and no army can subsist in an enemy's land without a tremendous train in the way of supplies. Since Napoleon's time, no army has lived on the enemy's country, because this country does not supply smokeless powder, the latest in muskets, machine guns and modern rifles, nor the materials for disinfected camps and antiseptic surgery.

The second element we may neglect as a figure of speech. Sea power makes for peace thru fear only, and the fear is strongest on the side having most machinery. On that side there is most to lose.

The third reason is based on passing conditions. Nowadays "trade follows the flag" only as the flag forces entrance into new abodes of savagery. Most savage races have been already exploited, and even are able to trade and to pray under police protection in almost every corner of the globe. This is the "Pax Britannica," the British Peace, which the whole world enjoys today, with extensive allowed satisfaction. Otherwise the navy meant little to commerce. The trade of Norway and of Holland, without sea power, is greater per capita and in relation to wealth than that of Great Britain or Germany. Even the trade of Switzerland stands, in proportion, above that of the great sea-faring nations.

The fourth reason given above involves the old fallacy that each nation is an individual, mean, brutal, grasping, ready at any instant to pounce on its unprepared neighbors. All this in face of the fact that nations are composed of multitudes of people each with will and opinions of its own, and each intent on his own affairs, while no move of any importance can be made without their co-operation and consent. And whatever else they want, they do not want war. Commerce in civilized nations is a mutual affair, and in almost every cargo that crosses the ocean men of all nationalities are interested. In the single matter of insurance the whole civilized world is bound together by the closest of ties.

The fifth reason, the preservation of the Pax Britannica, and of its cousin the Pax Germanica and the maintenance of crown-colonies and coaling stations, has been already noted. It does not take a thousand-million-dollar navy to accomplish this, and if it did it would not be worth while. Some good men have doubted whether it is worth while anyhow. Others have called it "the White Man's Burden."

The sixth reason rests on the perennial fallacy that sea power means control of the sea. Control of the sea is a meaningless phrase, invented for use in such discussions. No nation can ever control the sea. Its authority is bounded by the three-mile limit. The open sea is a highway belonging to all peoples alike. In time of war it may be a bit

dangerous to vessels of belligerent nations. But war is not an enduring condition. It is now beyond the resources of any nation to carry on war with an equal nation for more than a few months. Then the lanes of traffic are open again and cannot be closed unless thru channels of commercial competition. This has nothing to do with sea power.

To say that the United States must fight Japan for control of the sea, as some of our armament promoters have claimed, is the acme of idiocy. There is nothing to fight over, and nothing is settled when the fight is done. The sea is still open to every comer, and there is space for a thousand merchant ships where one now exists.

Moreover, one of the next moves at the Hague Conference will be the neutralization of all merchant and passenger vessels. When this is done, war will no longer hold piracy in the long list of its evils.

Sea power is a device for doing injury at a distance. All such injury reacts on the nation which does it. Even bombarding a village of Senegambia costs more for powder than a dozen such villages are worth. The greater the sea power, the weaker the nation. The strength of a nation lies in paying its way. It is weakness to be in debt. In all society, in all history, the creditor controls the debtor. We are told, however, that the monstrous war debt of the nations of Europe is a blessing, because the interest money is paid out at home. The gold does not go out of the nation, to be sure, but there are nations within nations. A little group may be a parasite on a great one. It is time that the Rothschilds in London are recorded as English, those in Berlin as German, those in Paris as French. So with the other houses, a dozen or two, of the "Consortium" of bankers, the Unseen Empire of Finance. But in every nation this Consortium is an alien affair. Its members work together. The Unseen Empire in each nation considers its own interests alone. Its business is to loan money to nations, the usury paid in advance, the bonds "absorbed" and placed where they will do the most good. The gold paid out in interest and usury does not leave the country. It merely flows from one class to another, from the pockets of the common man to the vaults of the powerful, from those who waste money to those who can make money work, in whose hands the confluence of a million little streams can swell to a great river. The progress of events drains the earnings of the common folk to build up this unseen enemy. And the great holdings in foreign lands possessed by the chief nations of Europe, do not represent the people's savings. They represent the interest on war debts and armament loans voted by the people in excess of fear or of patriotism.

It is not by the wealth, the power, the enterprise, the culture even, of the few that the character of a nation should be judged, but by the opportunity it offers to the common man to make his life count. It is not true because "wealth accumulates" that "men decay." Men decay is where wealth accumulates in the hands of those who have no constructive part in producing it. The parasites of a nation are no part of its actual life. The cancer victim does not rejoice in the vigor of the monster which devours his tissues.

In one of his many discussions of sea power, Admiral Mahan suggests that the growing unwillingness of the people, the world over, to pay for it may be due to their "degeneration." Degeneration, as thus used, is a word without meaning. The only "national degeneration" known to science is found in the reduction of the average force of the units of which the nation is composed. The value of a nation depends on the value of these units. Such reduction can be due as a temporary matter to poverty or to failure in education; or as a permanent matter it may be due to emigration, to immigration or to war. Emigration from many parts of the world has lowered the average at home by taking away the best. Immigration may lower the average in a land, by filling it up with poorer stock, "the beaten men of the beaten races," in the continent from which they come. War destroys the strong and bold, leaving the weak and commonplace for the work of parentage. Everywhere and under all conditions, as war exists today, it brings about the reversal of selection.

We can find better explanations of the growing aversion of the people to borrowing more money for more sea power. Their growing poverty on the one hand, their growing intelligence on the other, and the increasingly murderous cost of the whole thing, seem to furnish adequate reasons. It may be true, as Admiral Mahan indicates, that the growing cost of armament no more than keeps pace with the increase of national wealth. Of whose wealth? In this discussion we may set aside the swollen wealth of those who produce these armaments and that of these people of no nation who loan the money these armaments cost. All these rest on the people's shoulders. In the long run, it is the common man, the ultimate producer, the ultimate consumer, who pays for all. For all waste production and for all waste consumption, the cost falls on the worker at last.

The greater the sea power, the weaker the nation which buys it on borrowed money. It is agreed that to strengthen Great Britain's army would weaken her navy, even destroy her sea power. The greater the sea power the greater the national debt. The weaker the nation, the greater her need of sea power. In these paradoxes we find a clue to the constant state of alarm in England, whose sea power outweighs that of all her rivals put together. She is weak, because her people have been strained past the limit. England is rich, if you look at her from above. The dukes got her land—for nothing and free of taxes—in the early merry days when a county was given to a favorite, free of taxation, except for his duty to raise so many troops on call. And from his duty, these great Lords, Westminster, Norfolk, Bedford, Cavendish, Devonshire, Argyle, Sutherland and the rest have been long since released. In spite of the menace of the terrible Lloyd-George, they still hold half of England in their grip. And the people cannot help themselves.

The Unseen Empire of Finance has already "absorbed" and "distributed" $26,000,000,000 of war bonds for the States of Europe. On this sum the people pay $1,150,000,000 each year in interest. In its turn it guarantees the peace of Europe. It will not let its creditors fight. Kipling tells us the story of Dives in hell, who was set free on condition that he would bring peace to all the nations. He sold them sea power and land power, and bound them in the bonds of debt so that they could not fight. This is a parable. His real name was not Dives, and he was not in hell when the story begins, merely in a dingy, high-gabled, four-story building in the Judengasse at Frankfort-on-the-Main, a pawnbroker's shop with the sign of the Red Shield. From this he set forth to bring peace among the nations. He was at Waterloo, and he rode the wave of British gold which wrought the downfall of Napoleon. To him and to his assigns his Great Britain still pays $150,000,000 interest money per year for his powerful assistance. His spirit still rules. He plays no favorites, and the armament syndicates know him as their best friend. He is still the "uncle of the kings."

Behind and beneath all this stand the people. They do not count for much in grand affairs, and their final end according to Gambetta is a "beggar crouching by a barrack door."

The defense our nations need is not protection from each other, but rather defense from the money lender and from the armament syndicate.

STANFORD UNIVERSITY, CALIFORNIA.

TENNIS IN CENTRAL PARK

# New York as a Summer Resort

BY GEORGE ETHELBERT WALSH

NEW YORK CITY is one of the most popular summer resorts in the country, and statistics show that more people come here in the vacation season than, with but few exceptions, visit any typical mountain or seaside summer place devoted exclusively to the entertainment and accommodation of transient vacationists. Several hundred thousand people spend a part or all of their vacation in the metropolis every year, and they come from the four corners of the earth—south, east, west and north. Some combine business with their pleasure, using a business engagement as an excuse for journeying to the city, but the great majority choose the metropolis in preference to other places for spending a vacation.

The popularity of New York as a vacation resort for tens of thousands of people living in the country for the rest of the year has steadily grown in recent years, and the hotels, boarding houses, rooming houses and owners of furnished apartments cater to this incoming crowd every season. Many of the hotels offer more favorable rates to summer patrons than can be obtained at any other season, and the same is true of boarding houses and those who rent furnished rooms to outsiders. Every summer hundreds of furnished apartments are rented at considerable less than the regular price, unfurnished, on lease by the year. There are thousands of college students whose rooms are vacated in summer, and these can be had for much less than the standard winter prices. Boarding house keepers cater to the summer vacationists by offering better tables and further inducements in the way of lower prices.

For the accommodations given New York in summer is the cheapest resort

probably in the country. Of course, there are extremes, the high-priced $5 and $10 a day hotels and the third-rate boarding houses that give you a hall bedroom and an apology for meals at $4 and $5 a week; but between these are many respectable places that cater to the visitors in a satisfactory way at reasonable prices. For $8 to $12 a week one may secure excellent board in quiet, well-ordered houses, and in good family hotels, the rates begin at $12 a week or $3 a day, and run up to $25 a week and $5 a day. Furnished apartments, with kitchen or kitchenette, suitable for two or four, can be rented for the summer months at $40 a month up to $100. Furnished rooms in apartment hotels with restaurant attached run from $50 a month up. At these prices one is sure of getting more fresh fruits and vegetables on the table than at three-fourths of the country boarding houses or hotels, for New York, after all, gets its choice of all the products of the land, and all the delicacies of the season are often cheaper here than at the places where they were produced.

New York is favorably situated for catering to the varied tastes of an army of vacationists, and in summer a new world of sight and sound is opened to the visitors. Excursions by water and rail radiate from the city in all directions. Few places could offer a greater bewilderment of sights and scenes. The beaches alone within an hour's ride of the city are worth recording. Coney Island, with its blaze of light and multiplicity of shows, cheap and otherwise; Rockaway, surrounded by bay and ocean and fanned by every passing breeze; Brighton Beach, with its hotels, music and excellent ocean bathing; Midland and South Beach, on the outskirts of Staten Island, and North Beach and several others on Long Island Sound, where boating and still water bathing are unsurpassed, are all within easy distance of the metropolis either by boat or trolley.

Water excursions up the Hudson as far as West Point; up the Sound beyond City Island and Great Neck; down the Bay to the Jersey beaches, Sandy Hook, and beyond to the Long Island beaches and the fishing banks, and around Staten Island, thru the Narrows and Kill von

BY THE SHREWSBURY-ES ROUTE FOR ASBURY PARK

THE OLD POLO GROUND

LUNA PARK—CONEY ISLAND

Kull, circling the Statue of Liberty, are of daily occurrence, and for half a dollar one can spend the greater part of the day on salt and fresh water. Those piscatorially inclined can indulge in their sport in a day on the fishing banks, where all deep-sea fish are caught in numbers to suit the most exacting followers of old Izaak Walton. Altogether, two score excursion boats leave the city daily in the summer season, with bands playing, flags flying and refreshments served aboard. Excursion boats completely circle Manhattan Island to give visitors a bird's-eye view of the city, passing up the East River to Hell Gate, thence up the Harlem River and thru the old Ship Canal to Spuyten Duyvil into the Hudson, and down that river to the bay and the starting point.

New York is today flanked by great parks which offer about every outdoor amusement that one can imagine. Golf links at Van Cortlandt and Pelham Bay Park, tennis and baseball at Central Park, and picnics, and any of the quieter amusements at the Bronx and outlying recreation centers, form endless attractions for those interested. In the Bronx, in addition to the natural scenery of the place, there is collected the finest assortment of wild animals, birds and reptiles in the country. In Central Park the two great museums—the Metropolitan Art Museum and the Museum of Natural History—must appeal to any lovers of art and natural history. Their wide, spacious halls and galleries are as cool in summer as a beach facing the ocean.

Catering to the visitors is a special function of more than two score amusement companies. The sight-seeing automobiles take in Fifth avenue, with its fine collection of millionaire mansions and palatial clubs; Riverside Drive, with its view of the Palisades, Hudson River, Grant's Tomb and many other sights of historical value; Broadway, with its mammoth hotels and skyscrapers, apartment houses and great department stores; and the lower part of the city, where the aliens of every nation are crowded in congested quarters like bees in a hive. The roof gardens are in full swing on summer nights—gardens which overtop all except the loftiest buildings. Music, song and refreshments in these gardens are rendered more attractive by the costly arrangements of imported shrubs, trees and flowers, which combine with the electric lights to form an illusion of fairyland.

Even the great department stores are alive to the interests of the visiting summer tourists, and their doors are thrown wide open to attract those seeking diversion and recreation in bargain hunting. Cool reception rooms, inviting tea rooms and parlors lavishly fitted out are no less attractive than the real bargains offered. It is a well-known fact that in the dull summer season the stores reduce prices to attract trade, and thousands of summer visitors take advantage of these mid-season bargains. The average American woman likes to "go a-shopping" at least once a week even in the hot season, and the city stores, instead of being deserted, are often as well patronized as in the spring and fall.

There are few places whose round of amusements cannot be exhausted in a week's time, but it would take a month or two to follow up all the trails in the metropolis, and some are so interesting that one wishes to repeat them several times. The visitor would go to Brighton or some of the other beaches many times in the course of a summer to take a dip in the ocean. A trip up the Hudson to the top of the Palisades for a day's outing will be repeated more than once if he is a full-blooded American, in sympathy with the beautiful in Nature. Under the shadow of the Palisades camping colonies have sprung up in recent years, and one might even choose to pitch his tent there on the shores of the lordly Hudson as the Indians did before the "Half Moon" sailed up it and discovered the river to the white man.

Even in boating opportunities New York is not far behind seaside resorts. On the Harlem there are numerous rowing and canoeing clubs, where these sports can be indulged in to the heart's content. On the Hudson are half a dozen yacht clubs, and several others on the Sound and Gravesend Bay. The sailboat and motorboat are as common sights as the gulls which float in great flocks on the bosom of the river and bay. As all roads led to Rome, so all highways and trails radiate from New York. Whether one owns an automobile, a motorcycle, or is content to walk, the

opportunities for exploring a country-side filled with picturesque views and historical associations are unsurpassed in the world. There is no monotony in these walks or day tours from the city, and whether one tramps the towpaths of the Morris and Essex or Raritan canals across the river in New Jersey, or crosses in his automobile to the fine highways of Long Island, or takes a spin up in beautiful, rolling Westchester County, there is always variety and picturesque surprises in landscape and sky.

These are but a few chief reasons why New York attracts thousands of vacationists in summer—people who come from all parts of the country to find pleasure and recreation mingled with business and education. And frequently it is the transient visitor who discovers the real beauties and opportunities of the metropolis. The old resident is always waiting for the day off to take in a complete tour of the sights, but the visitor is not guilty of this procrastination, and after a week's sojourn here he is often able to give the typical New Yorker points on the advantages of his own town as a summer resort.

"I've spent five summers in New York and enjoyed them," a Southerner remarked.

"And I never spent one, except to work in my office in the day time and rush for the train at night," replied his friend, who had lived in the city for thirty odd years, "and all that, you know, I hate."

The point of view is everything.

NEW YORK CITY.

# The Flag

BY EDITH M. THOMAS

THERE were three colors in the banner bright
  On which the maidens stitched and stitched all day.
Their needles glanced, for with the morrow-light
  Each saw her hero-lover march away.

Save one, the maidens stitched with fond, proud haste;
  And her they chide: "Why do thy fingers lag?
Think but how fair will gleam by farm and waste
  The red, the white, the blue, of their loved flag."

The maiden lifted not her hands, her eyes:
  "The red of flowing blood I see," she said;
"The white of faces upturned to the skies,
  The blue of heaven wide above the dead."

NEW YORK CITY.

# A Dangerous Political Hybrid

BY PORTER J. McCOMBER

United States Senator from North Dakota.

WE arrive at most of our conclusions in life thru a sense of observation, and we acquire certain convictions which cannot be shaken by arguments. But if we study facts and statistics in the light of all surrounding conditions we find that they generally agree with what observation teaches us. It is difficult to divest ourselves of the influences of our life's environments, especially of those convictions engendered during the formative period of our existence, when we were first brought face to face with a world into whose conflicts we were sometimes prematurely hurried by the necessities of the situation.

I admit that I carry a deep interest in favor of my early companions and of all those who labor in fields—whether thru inclination or because controlling conditions have chained them to the reluctant soil—thru the influence of a backwoods farm, the memory of whose hardships and limitations always touches into vibration every chord of my sympathy.

In considering the so-called reciprocity pact with Canada, I started out with the conviction that never within the period of recorded history, never since cities were known, has the tiller of the soil lived on a plane of equality, measured by comforts, luxuries and opportunities, with dwellers in the cities, and that the wealth and grandeur of the cities of today represent a tribute exacted from the tillers of the soil. I have an abiding conviction that there is a wrong to be righted which can only be accomplished by increasing the profits of country occupations till they equal those of the trades, so far as governmental agency can properly bring about such a result. When I go thru the country and compare with those of the city, the homes, the furniture, the clothing, the opportunities and environments, the expenditures for luxuries and unnecessaries, I know that the farmer and the farmer's family receive far less for their labor than any other equally intelligent workmen in the United States.

It is the economic laws which in this age of enlightenment permit such a condition to remain that need amendment. We cannot by legislative enactment remove great natural barriers, or utterly overcome the great economic conditions of the world's supply and demand, as they affect the general level of values. But every great country, thru its revenue laws, does affect the value of the products of its important industries within its own borders, and does protect, stimulate, and make profitable, industries which otherwise could not stand the test of international competition. To that extent I would invoke legislation *favoring* the American farmer. If I could raise his financial condition so that his life would more nearly correspond with the life of the average inhabitant of the cities, I would do so.

So, after the reciprocity agreement had been consummated by the American and Canadian negotiators, and its terms were for the first time made public, I carefully studied all of its details. I found it so onesided in its intended benefits, and so harmful to the interests of our people, that I am forced to believe that this treaty, if enacted into law, will not only postpone for many years the consummation of a hope indulged in by farmers of the country—a hope held out to them by every speaker and writer who ever sought to secure their votes for the protective policy of the great Republican party—but that its ultimate result will be to destroy the policy itself. The enactment of this pact into a law will grievously injure the agricultural interests of every Northern State and will benefit the agricultural interests of *no* State. It will strike a blow—and a hard blow—at all our agricultural interests.

In his position on this subject, as outlined in his Chicago address of June 7,

I am sure that President Taft wishes to be fair. But it is evident from his address that he has been imbued with many misconceptions; for example, with the very general error that Liverpool fixes the price of our wheat. It is easy to refute that fallacy and to show that the proposition has no possible application in localities where the home demand is greater than the supply—which is always the case in the vast area drained by the demands of Minneapolis milling interests.

In his address the President says:

"The only real importation of agricultural products which we may expect from Canada of any considerable amount, will consist of wheat, barley, rye and oats. The world's price for these four cereals is fixt abroad, where the surplus of the producing countries is disposed of, and is little affected by the place from which the supply is derived."

Take, for example, the great Northern wheat producing States, yielding the particular grade which is necessary to the mills of Minneapolis. As a matter of fact, the actual total cost of transporting wheat from Minneapolis to Liverpool, allowing nothing for profit, is about 15 cents a bushel. If Liverpool fixes the price of wheat in these States then the price in Liverpool must be at least 15 cents a bushel greater than the price in Minneapolis, for the same kind of grain. But the Bureau of Statistics, of our Agricultural Department, shows that for the year 1909 the average price of No. 1 Northern wheat in Minneapolis was $1.20, and in Liverpool $1.29—only 9 cents more, and that for 1910 the average price in the two cities was precisely the same. How indeed could the price in Liverpool fix the price in the Minneapolis market when, as for the past three years, there has not been a day when there was a surplus bushel of the kinds of wheat required by the Minneapolis mills and produced by the great Northern States, to ship anywhere. The supply has not fully equaled the demand; and such local conditions, anywhere, will fix the local price, regardless of the world's market.

If the President had said that the price of the vast production of the same grade of wheat, in Canada, is fixt in Liverpool, he would have been correct. For the Canadian product is nearly all surplus, and must be sold on the world's market, at the world's price. As it is the same grade as is raised in Minnesota and the Dakotas and required by the Minneapolis mills, it is easy to see that if the existing tariff wall of 25 cents a bushel were removed, it would flood the Minneapolis market, instead of going to Liverpool. It would instantly destroy the present conditions, where the local demand consumes the entire product of our great Northern States—the conditions which now hold the Minneapolis price from 10 to 15 cents higher than Liverpool; and also 10 to 15 cents higher than Canada. Without raising the price of Canadian wheat it would reduce the price received by our farmers to just the level of the world's market. And while the duty is left on flour, to protect the milling interests, it is equally obvious that the reduction in the price of wheat would *not,* in the remotest degree, reduce the price of bread to the general consumer. Whatever benefit there may be will revert to the Canadian farmer, in a nearer market, and to the American mills; while the inevitable loss must all be borne by the farmers of the United States.

With all his manifold duties the President cannot possibly investigate the details of every question, and his address simply demonstrates the fact that those to whom he has looked for information have not given him the actual status. In explaining the difference of 10 to 15 cents a bushel between the price of wheat in Canada and our Northern States he says:

"Canadian wheat nets perhaps 10 cents less a bushel to the producer than wheat grown in the Dakotas and Minnesota, due to the fact that the cost of exporting that wheat, warehousing it and transporting it to Liverpool is considerably greater than the cost to the Dakota farmer of disposing of his wheat."

It is apparent that the President is laboring under a mistaken idea that this difference in price applies only to places where there is a difference in the cost of transportation, etc.; whereas the truth is that the difference of 10 to 15 cents exists all along the border line, where the

expense is exactly the same, and where the Canadian wheat goes right thru the United States, under bond. While back in the interior of Northwestern Canada, where the cost of housing and transportation *is* greater, the difference in price is just so much more.

Certainly the President will not contend that it costs more to transport wheat from Port Arthur, on the Canadian side of Lake Superior, than from Duluth, on the American side of the lake. Yet for several years the Duluth market has been from 10 to 15 cents better than the Port Arthur market. All that is necessary is to remove the protection on wheat to bring it over the line and instantly wipe out the 15 cents now reverting to our farmers.

It is not at all sure to raise the price of wheat in Canada or even to give Canada the greatly increased market which they expect. The demands of Minneapolis are not greatly in excess of the supply. The two products will simply be put in competition, inevitably reducing the price of our wheat to the world's market price. There are statesmen across the border who realize this and who are lifting up their voices against the ratification of the treaty. Their speeches are quoted by those who indorse the measure, in this country, as tho the fact that some in Canada object to it was proof that there must be something in it of benefit to us. They have reason to object to it and so have we. The only absolute and unavoidable result of the treaty will be to reduce the profits of our farmers without any material compensatory benefit to the country at large, in reducing the cost of living or increasing our trade with Canada. Whether a bushel of Canadian wheat ever crosses the line or not, if the duty is removed the prices on each side of the line will be the same—and with her vast reservoir of surplus wheat the Canadian price must always be regulated according to the world's market.

The proposition amounts to the assumption that the farmer is now receiving unjustifiable compensation for the labor and capital he invests. Can this be possible? On the authority of our Agricultural Department there is an average profit of $2 per acre to the farmer in the States of Minnesota and North and South Dakota. This estimate entirely leaves out the depreciation of buildings, machines, and horses, and interest on mortgages, and insurance. Neither does it include the year 1910 when, on account of drought there was almost an entire crop failure. The farmer is allowed simply board and lodging—and mighty meagre board and lodging it is.

Out of his 160 acres if he has 120 actually in crop, and escapes losses by fire, hail, drought, etc., he will make a profit of $240 a year, to renew his farm machinery, buy new horses when old ones die, clothe his family, educate his children, pay their doctor's bills when they are sick and to buy cheap coffins for them if they die; and if he starts on nothing, as other ordinary laborers, and begins with a mortgage on his farm, he has that to carry, as well. Is there any other intelligent labor in the United States which reaps such mean return? Reduced to a mathematical statement he receives 6½ cents an hour for his work. The bricklayer in the city receives 62½ cents an hour. If any industry in the United States deserves and requires protection it is the agricultural industry; while this treaty deals a deathblow to all hopes and possibilities beyond the common lot of the poorest class of people—the producers—the world over.

I have spoken of agriculture and illustrated it by wheat simply to put in concrete form an argument that can be most readily understood. There are many other ways and many other matters in which it is condemnable.

It is not a Republican measure. It is not protection. It is not a Democratic measure. It is not for revenue. It is a hybrid which inherits none of the good qualities of one parent and only the bad qualities of the other. It is a dangerous measure, insuring benefit only to exclusive interests but insuring certain damage to the most important class of citizens in our own country. The Republicans in Congress are almost solidly against it in sentiment and a majority will be against it in the final vote. It will win by Democratic votes. It cannot be charged to the Republican party except that it is supported by a Republican Executive. It will win from the fact

that the Democratic party, thru its representatives, after conferences and caucuses, has espoused it. It is really an opening wedge toward free trade, and no one with the interests of the laborer at heart can fail to dread its effects, as time goes on, upon the status of the working man, in America. Neither can a political party supporting a measure in exact antagonism to its cardinal doctrines long hold supremacy.

For selfish ends the great press of the country created a false and prejudiced impression and nearly overthrew the Republican party at the last election. For selfish ends it proposes, now, to support the party, next year, provided this reciprocity agreement is enacted. But there is a limit even to the power of the press. It is a difficult task to make wrong look right to the man who is himself suffering the wrong, and it will be beyond the power of the press to bring out the enthusiastic agricultural vote which in all time past has saved the doubtful States to the Republican party, in support of its policy of protection, when everything on the agricultural schedule must compete, unprotected, in the open markets of the world, with what is destined, in a few years, to become the greatest agricultural producer in the world—our neighbor, Canada.

Surely the agricultural vote cannot consistently turn to the Democratic party, by whose adoption this treaty will be passed, destroying every vestige of agricultural protection, but it will see to it that its representatives are those who will stand pledged to right or adjust the wrong inflicted upon them. In other words if their products are ruthlessly placed on the free list, our protective policy will lose its ancient support.

WASHINGTON, D. C.

# Events in Great Britain and Ireland

BY JUSTIN McCARTHY, M.P.

THE sad news of the death of Sir William Schwenck Gilbert must, I feel well assured, have created as startling a sensation thruout the United States as here in England, the land of his birth and of his career. He had indeed a most interesting career and the manner of his death was in keeping with some of the most characteristic qualities and peculiarities of his nature. He was drowned in his effort, at the age of seventy-five, to save a young woman from drowning in a pond in his country seat near London. Few men, if any, in our days can have made his influence more thoroly and more genially acknowledged in its own fields than was that of Sir William Gilbert thruout the music-loving public here, there and everywhere. For many, many years the names of Gilbert and Sullivan were thoroly associated in the minds of all men and women who loved music and drama and who appreciated the combination of song and story. Gilbert was personally one of the best known and the most widely popular in the vast and various world of London society and among many classes who are not always recognized as coming within the ordinary social limitations of London's ruling sets. It was a rare and beneficent stroke of fortune indeed, not merely for Great Britain and Ireland and all the English speaking lands, but for the whole of the music-loving world, which brought two such men as Gilbert and Sullivan to combine the musical endowments of the one with the literary and the dramatic conceptions of the other. Many of the songs of Gilbert and Sullivan have found their way and made themselves beloved companions of numberless humble homes whose occupants had never known the delight attending a musical theater. The names of Gilbert and Sullivan are, I feel sure, destined to live together in the story of England, long after some of England's achievements in other fields of conquest shall have been wholly forgotten.

The visit of the Kaiser to England is coming to be more and more generally

regarded by the more intelligent observers as a genuine success. I do not mean now a success of mere sensation evidenced and illustrated by the rushing and struggling of curious crowds, the crowding of gorgeous carriages, and the paraphernalia of courtly and civic demonstrations. But I think it brought home to the minds of the British public in general the beginning of a genuine conviction that the public at least of England has for a long time been doing its best to make Germany an enemy and not a friend of this state. I hope and believe that England has got over the infatuation and is working her way toward not merely a proclaimed but also a sincere and an enduring peace between the two peoples in so many ways instinctively allied and who yet have so long been to all appearance drawn or drifting into proclaimed hostility. England has now for several years been daily instructed by her newspaper press in the national duty and the national necessity of making the most extensive, practical and self-proclaiming preparations for resistance to the inevitable invasion of her coasts by a German fleet and a German army. Yet I always knew that among educated Englishmen and women German literature has for generations been regarded with the warmest admiration and sympathetic affection. The music of Germany held its sway over the tastes and the hearts of successive generations in Britain. I know well that in my own native country, Ireland, we young men were as enthusiastic about Goethe and Schiller as about any of the poets who wrote in the language which formed our own vocabulary. I find it very hard to understand how the British public can ever have been led to look upon Germany as England's natural and determined enemy and feel convinced that she is forever plotting an invasion of the island as one of her predestined duties. I have good reason to believe that the visit of the Kaiser was arranged for on both sides as the most decisive evidence that the German sovereign and the German people have not and never had any such sentiments of irrational hatred toward England or any dreams of adding to the military triumphs of the new Empire by a sudden invasion of the old kingdom's coasts. The Germans, and more especially the inhabitants of Prussia, now the leading Germanic State, were drawn or driven into their two great wars by the most intelligible and indeed obvious causes. The earliest was the long impending struggle between Prussia and Austria for the leading place in the rule of German affairs. Prussia was always going forward in the ways of education and civilization and Austria keeping up the policy of the past ages and endeavoring to force all those who spoke the same language and cultivated the same literature as she to accept her political guidance. The world outside both countries had long been expecting some struggle for superiority between the two dominions, and it came at last and with the foreseen result—the defeat of Austria and the proclamation of Prussia as the leading German state. Then followed in due course the struggle between France under Louis Napoleon, for the time Emperor of the French, and the new and very formidable power of Germany which ended in the complete overthrow of the French Empire. Now I fail to see in all this passage of troubled history any reasonable explanation for the at present rather popular theory that the German Empire can feel in any way tempted to undertake such an enterprise as the invasion of Britain. England is not ruled by a Louis Napoleon nor has she ever been occupied in modern times by a conquering invader of her seaports. The Germans are too well instructed a people to be captivated by a policy such as that for which Charles XII of Sweden might once have yearned. The German Kaiser undoubtedly intended his visit as an errand of peace and as such I can have no doubt the British public have accepted it. I sincerely hope that we shall hear no more about the threatened descent of the German war-vessels or the German airships on the coasts of Britain.

Meanwhile the great parliamentary struggle of England herself drags slowly on and seems at the moment to have practically disappeared from general consideration. It is hardly now even a common topic of daily conversation. Even the Tory party seem to have made up their minds that events must go their best way and that there is nothing to be gained by talking about them. The House of Lords is foredoomed and the

most sanguine conservative does not believe that there is the faintest chance of its being restored to the position which it held for so many centuries in British political life. The British Tory may also be said to have made up his mind to the almost immediate passing of the legislation which is to give to Ireland her National Parliament by the passing of the Home Rule act. The vast majority of the English public have long been growing more and more resolutely reconciled to the principle which inspires the Home Rule movement. I do not say that the recent converts to this principle among Englishmen have all been thus influenced merely by a conviction that the principle is in itself one of right and justice. I know and know of many indeed who have been thus and not otherwise won over and who have become converted to the principle of Home Rule by the recognition of the fact that a people as intelligent as the Irish and on the whole as well educated may be safely entrusted with the management of their own affairs within their own boundaries. But on the other hand there are many Englishmen who have come to regard the agitation for Home Rule as a necessary attribute of Ireland's national right or at any rate of one which is not to be got rid of by any mere force of argument from hereditary opponents. I cannot but think too that the attention which has been for many years or even generations drawn toward the everincreasing growth in the prosperity and also in the loyalty of the independent British colonies has had much to do with the change of feeling thruout England, Scotland and Wales on the whole subject of Home Rule for Ireland. I have been day after day more and more encouraged and delighted by the increasing impression created thruout these countries by Mr. John Redmond's recent article in *Reynold's Newspaper*, one of the most thoroly popular of British journals, on the Home Rule question. I quote the opening sentences of this masterly article. "The opponents of Home Rule are neither logical nor consistent. In one breath they say that so intense is the desire of the Irish for Home Rule that nothing less than total separation will satisfy them, while in the next they say that Ireland does not really want Home Rule, which is merely a cry got up by interested agitators, and that all the Irish want to make them happy and contented is the settlement of the land question. Now, a very little acquaintance with facts of Irish history since the Act of Union makes it clear beyond the possibility of doubt that great, pressing, and urgent as were the questions of Catholic Emancipation; of the Tithe system, and of Protestant Establishment, of University Education, of Municipal and Parliamentary Enfranchisement, of Local Government, and of the Land, no other Irish question has been or is of such great and urgent and overwhelming importance as the question of Home Rule —the right of the Irish people to full self-government in all purely Irish affairs. The settlement, or partial settlement of all these other questions has not in the smallest degree altered the character of the demand for Home Rule, or lessened the intensity of the devotion of the masses of the people to their national ideal. In fact the opposite is the case. As the material prosperity of the people

MR. AND MRS. JOHN REDMOND

has increased, and as education has spread, their insistence upon Home Rule has become, if possible, stronger year by year. Never was there so insistent and consistent a demand made by a nation generation after generation. The reason is that the demand for Home Rule does not rest merely upon grievances, but upon the sentiment of nationality. Ireland is not a British province, nor an English shire, but a nation with a strongly-marked individuality differentiating it from England, Scotland or Wales, and which it is impossible to suppress or to ignore. Home Rule means the recognition of Ireland's nationality, and a concession to the national sentiment of the country. But, apart from the sentiment of nationality, the Home Rule argument based upon grievances is overwhelming. Home Rule is a practical question for Irishmen, because foreign rule has meant home ruin for Ireland. Even if Ireland were as prosperous and contented under the Union as she is the reverse she would still be entitled to, and would demand, Home Rule, for as Sir Henry Campbell-Bannermann wisely said, 'Good government is no substitute for self-government.' If the Parliament at Westminster had all the knowledge necessary for the good government of Ireland instead of being made up of men, the overwhelming majority of whom never laid foot in the country, or studied her history or her problems—if in addition to this, Parliament were animated by sincere determination to remedy every Irish grievance, neither the knowledge nor the good will would avail for aught because of the simplest of all reasons—the want of time. The amount of work which the Imperial Parliament is supposed to do and of course does not do is appalling. The necessary result is the work is not done, because it cannot be done. Three days a year only as a maximum, and sometimes, in times of stress, one day or no day at all constitute the provision for discussion of all the revenue and expenditure of Ireland, amounting to many millions, and covering the whole field of administration and government. It is ludicrous, but it is also criminal. It has led to the wholesale robbery of a poor nation tied up, in partnership with a rich Empire, of whose every need and extravagance she is forced to pay a share." This extract from Mr. Redmond's very effective article can hardly fail to impress the mind and the judgment of any reasonable Englishman. I believe, however, that the leaders of the present Liberal Government have long since made up their minds to crown their work this year by restoring to Ireland her self-government, her National Parliament and thus making her for the first time in British history a self-governing, a prosperous and a happy dominion of the new Sovereign, King George V, whose coronation we celebrate.

LONDON, ENGLAND.

# If We Could Tell

BY KATHARINE LEE BATES

If we could tell this dog of ours, this dog who loved you so,
That you have journeyed from us by the road which keeps no tread,
No bending of the asphodels, no print upon the snow,
Perchance your voice might reach us from the dead.

If knowledge cast in human speech could answer his surprise,
His trouble at your silent door by bark and bound unstirred,
The question yearning up to us from brown, beseeching eyes,
We, too, might comprehend celestial word.

But untranslatable to him remains our little lore,
And incommunicable unto us of earth-bound brain
The crystal tides of wisdom your compassion longs to pour
Upon our pleading and bewildered pain.

WELLESLEY, MASS.

# King of Field Games

BY JOHN R. FLANNERY

[Mr. Flannery is the world's greatest figure in lacrosse. For many years a potent and busy official of the Standard Oil Company, he has spent his time and money as a zealous missionary of the game and has well earned his fame as "Father of lacrosse in the United States." Forty years ago he was a member of the Shamrock team that won the world's championship. Twenty years ago he organized and drilled the lacrosse team of the New York Athletic Club, champions of the United States. Time has taken some toll of him as of others, nevertheless he is still an agile, alert, dexterous player, capable of "showing" his juniors. He sees his plentiful harvest sprouting all about him, yet, like other true missionaries, is not satisfied. He wants more.—EDITOR.]

LACROSSE is undoubtedly king of the field games. It is the most graceful and beautiful, and it is also best for both players and spectators. In all the years that it has been played by white men, it has never directly caused one fatality, and I don't believe that there can be found an instance in which a player died of consumption, tho consumption carries off so many other athletes. Also it is the real original American field game—in fact the aboriginal American game. The Indians played it before the white man came.

Lacrosse may look rough at times when one player chases another down the field, lathering away at him with his stick. But the stick is only about a pound and a half in weight, and is lightest in the part used for striking. It is also netted, which takes away from its availability as a weapon. If a player deliberately tried to injure another by blows of his crosse, the worst he could inflict would be superficial cuts. The play is so open and referees so sharp that the foul is almost eliminated. In football the men often pile up in a heap, and sly fouls of a very serious nature may be and often are inflicted, but that can't be done in lacrosse. There is no piling up. The ball is a soft rubber sponge which does not hurt, even tho thrown full in one's face. As to the body check, no one was ever hurt by it. The worst foul worked is done by tipping a man's foot while he is running so that it catches on the other foot that he has thrown forward. This causes a bad fall. I got that one time, and it gave me water on the knee that put me out of business for about two months. But that foul requires great skill in the one who applies it, and it is very rare.

Taken on the whole, lacrosse is a notably clean game, and men may play it all their lives with great physical benefit. It is the finest thing in the world for the spectators. They don't have to be players in order to appreciate and understand. I've taken baseball and football cranks to see lacrosse games, and heard them in half an hour discard all their old athletic gods and worship only lacrosse, saying: "The other games are not in it. Lacrosse is far and away the best of them all." Al. Spalding, a thirty-third degree baseball fan, saw a good lacrosse game in Canada, and when he came back here, he said to me: "Why, lacrosse is the very best game that ever was played." Ladies understand it in a minute, and follow its struggles and perils and changes and swift vicissitudes with breathless interest. Spectators can always see and understand.

Lacrosse is democratic. Every player has his innings all the time while the game is proceeding. In baseball the catcher and pitcher are the most important men, and in some games they do almost all the work. But in lacrosse each player has a chance to shine to the full extent of his ability. Wherever the ball goes the battle for it rages, and every man who can get to the spot can dig in and do his prettiest for his side.

I have been working for thirty years to make the game go, and perhaps ought to be satisfied, because there is twice as much lacrosse in the United States today as there was ten years ago. And I am optimistic, for there are many cheering signs, especially in the High Schools

But when I compare what is with what ought to be, I always feel blue.

Lacrosse would do such a vast amount of good to the young men of the country if they would only take it up. It would put them in fine physical trim. A man must be careful of diet and temperate if he is to play good lacrosse. An hour's play three times a week would regenerate many of the anemic-looking specimens whom we see on the cars, and give them vigorous health.

And it is good for the head as well as for the body. In a hard match game much of the play is lightning fast, and the player's thinking must be even quicker. Lacrosse can use to advantage every good quality that a man has.

I was especially anxious that the army and navy should take it up, and worked to get it going at West Point and Annapolis. During 1907 I got the Johns Hopkins and Mount Washington teams to play exhibition games at Annapolis in order to show the Middies. The sport took and now Annapolis has a team that beats its teachers. It would have done well at West Point—they have a fine team there. But the military authorities in their wisdom decided to have six parades a week, and lacrosse had to go at least temporarily in spite of the fact that the schedule for the year had been made out.

That was a bad set-back, because matches between West Point and Annapolis would draw the government officials and their ladies, and spread the game far and wide. But I believe the difficulty will be surmounted. The boys want lacrosse, and as soon as the authorities see what it will do for the army, they will want it too.

There is a barrel of money waiting for the man who will present lacrosse as a regular spectacle to the American people. I believe that it can best be done in connection with baseball. When the baseball team is away on its travels, the lacrosse team should occupy its place. And here I mean professional lacrosse, organized in leagues, the teams representing cities. In the first year the baseball club paying the expenses of the la-

QUICKNESS IN MENTAL AS IN PHYSICAL ACTION IS ALL IMPORTANT HERE

DEFENDING THE GOAL

crosse teams would get their money back. In the subsequent years they would nearly double their receipts. It would only take about a year to make hundreds of thousands of lacrosse fans quite as devoted and enthusiastic as those who follow baseball.

The additional expense caused by the lacrosse teams would be very small. The baseball leagues already have their plants. Canada has professional lacrosse now, and it is doing well. Salaries are small when compared with pay drawn by the great baseball players—good men could probably be hired at thirty dollars a week for the season.

Some say: "Lacrosse is not like baseball. It is too hard a game. Men could not stand it to play six matches a week." That is all nonsense. I simply know better. My own experience has taught me that there is not great hardship in playing lacrosse two hours a day for six days in a week. Each team would require a few substitutes, and injuries are so rare that the substitutes could be managed so as to give any member of the regular team a day off when he really needed it.

My business of late years has been so engrossing that I could not afford to give lacrosse the time and attention I desired, and I was obliged to refuse an offer of a large salary to organize and manage a professional league. But there lies the opportunity waiting for the right man to grasp it. There is a barrel of money in it.

If I were managing the thing I would not bother to try to organize teams down here. I should go to Canada for my men. Up in Canada the boys begin to play lacrosse when they are four years of age. You could go to a town like Brantford and pick up all the men for one team without stirring out of the place. Professional lacrosse has not injured the amateur game in Canada any more than professional baseball down here has injured amateur baseball. Rather it has stimulated amateurism, developed possibilities, given better models.

Wherever there are good professional baseball teams the boys become enthusiasts, scores of amateur clubs start up, and you can see the youngsters practicing pitching, and playing ball all over the lot. Professional lacrosse would have the same effect. Amateur clubs would be formed by the admirers and followers of the game. There are only about fifty clubs in this country now. There ought to be a thousand.

England is doing much better. Oxford and Cambridge, and the other great colleges have taken it up, and it is spreading fast there. Experts are being developed, tho the London *Times* expresses the belief that their best will never be equal to the Canadian best.

An article in the Brooklyn *Eagle* of April, the writer of which evidently knew the game, declares that lacrosse is going ahead so fast in England that it may within ten years become the national game there. It is all amateur over there, and free from fouling. The writer says:

"The swift, straightforward onslaughts which are a feature of the English style might well be imitated by Canadian teams. The last two Oxford vs. Cambridge matches have confirmed this belief in a striking manner. The superior combination of the Canadian Rhodes scholars, who are missionaries of lacrosse at the elder university, and ought perhaps to be rewarded with 'half Blues' proving on both occasions less effective than the dashing frontal attacks of practitioners of the English style from the Leys School."

I agree entirely with that doctrine. Every time a player passes the ball he risks losing it. Of course against a raw team it might be all right for the home players to dance about in front of the goal, making all sorts of feints. The defense men might get rattled and rush out at their tantalizers, giving opportunity for a clean shot. But against veterans, such tactics are of no use.

The frontal attack is right. Shoot while you can. Men are all mortal, and the home player with the ball does not know how long he can hold it. Shoot while you can—that's what I've been preaching for years. I've seen the home players of the Cornwalls dash around, passing the ball from one to another for four or five minutes in front of goal. Beautiful, beautiful, clever, pretty work—but not war, as the French officer said. Shoot while you can. No matter how clever a goal keeper is, the ball is small, and there are holes all around in the goal space, any one of which will suffice for the home player to win the game, if he shoots straight and the goal keeper misses.

Lacrosse has become easier to play than it was when I began about fifty years ago. The crosse used then had netting as hard and flat as a board. It was quite four feet long with netting twenty-eight inches long. It was quite an art to keep the ball on the crosse, even when a man had it all to himself. It was a greater art to catch the ball thrown from a distance on the hard flat surface

PASSING THE BALL

[illegible] crosse suggestive of a scooped out snow-shoe

of the netting. The new player then found many discouragements. Some tried for years and never learned how to play.

This flat netting, with no pocket allowed, was a departure from the old game as the Indians played it. Some of the Indians used two sticks, but in Canada where the white man first found the game the Indians were playing it with one stick and a deep pocket in the netting. The white men made the game their own, and flattened the netting, eliminating the pocket. The advantage of the pocket, of course, is that it makes the ball easy to catch and carry, enabling the player who has it to do brilliant dodging. The advantage of the flat netting is that it makes for long throwing. I threw 135 yards at an exhibition on the Boston ball grounds.

Now the deep bag has come back, and the players who are used to the long stick with the flat netting will swear that there has been degeneracy. But I don't think so. The game is easier to play on account of the new fashioned stick which is somewhat like the old Indian crosse—but it is quite sufficiently difficult even at that.

How long does it take to make a good player? It depends on the man. I've seen novices become experts in the course of a year, and I have seen others who never could learn to play a good game. It depends largely on what sort of a head-piece the man possesses.

Who are the best players? White men now undoubtedly. Indians were originally, for it was their game. The Shamrocks won the championship from them first. The Indians did three times as much running as the Shamrocks and tired themselves out, and then the white men went in and beat them. White men have retained the supremacy ever since.

Indians don't live right, eat right, train right. They haven't enough good food. Nor have they perfected the game as the white man has. Go to St. Regis or Caughnawaga and watch their players preparing for a match The only practice they get is two or three of them throwing the ball to one another. That won't do. Preparation for an important match should mean hard, persistent training, including well worked out team strategy.

As to the best white men, that is a question. The French-Canadians have the championship now. They won it by the Nationals beating the Montreals before a record-breaking crowd last fall. They won by 4-0. The French-Canadians were the first white men to learn the game from the Indians, and they have always had plenty of good players, but the English-speaking Canadians coming later into the field beat them and held the championship for many years. Now they have regained the championship, and it will be interesting to see how long they keep it. The Nationals team is made up entirely of French-Canadians, while the men of the Montreal team are mostly of Scotch and Irish blood. It was a great victory for our lively neighbors the French.

The big clubs in Canada are not as representative today as they were forty years ago. Then the Shamrocks stood solidly for Ireland, Canada, and Democracy, the Montreals for Scotland, England, Canada, and Aristocracy. The Torontos resembled the Montreals. When the Shamrocks went to Toronto to play they found the players gentlemen, but the same could not be said of all the spectators, many of whom were Hibernians and young Orangemen, who took sides and poured foul abuse on the players. The Orangemen called us all the evil names that any one could think of, while the Hibernians paid similar attention to the Torontos.

During one of these games there was a villain who sat on the fence screaming curses at us. When I pursued the ball near him he gave me an awful broadside. I paid no attention, but Hoobin, coming after me, received a similar dose, and then there were consequences. Hoobin was never celebrated for sweetness and light, and he made a whack at that Orangeman's legs with his stick. The wretch, forgetting where he was sitting, drew up his legs, lost his balance, and fell outside with a dull thud.

Some of those old games were so bitter that they reminded one of the lacrosse matches between the Indian tribes of which Catlin tells us, when there were

five or six hundred players a side. The ball was of wood, and bloody murder raged all over the field.

All that is gone now. Religious differences are much less acute in Canada today than they were forty years ago. And the great clubs no longer represent localities as they did then. The Torontos do not really represent Toronto, the Shamrocks don't represent Griffintown, and the Montreals don't represent the silk-stocking district. They get their players where they can. On the Montreal team now are five ex-Shamrocks. Professionalism has killed the intense localism that once prevailed. When Torontos and Montreals play now, it is no longer a serious battle between rival cities.

The championship fluctuates. A club will perfect a team, win it and hold it a while. Then some of the players go away, and another club wins.

I hear that lacrosse is going well in New Zealand and Australia. Good! There can't be too much of it. As I said in the first place, it is king of all field games—the very best. And I know what I am talking about, for I have played baseball and football also.

Football, in comparison, I say it in all kindness and charity, belongs to the Stone Age.

New York City.

# Money and Banking Reform

BY EDWARD B. VREELAND, M.C.

Vice-Chairman, National Monetary Commission.

THE reform of our banking and currency methods, in the United States, is really of greater interest and importance to business men and to the thousands of laboring men than it is to the bankers. Banking is a close organization. It can be quickly limited. Loans can be called in, new loans shut off, and cash accumulated in the vault when a storm threatens; to the salvation of the bank, but to the great disturbance, danger and disaster of all other business, which is helpless. Banks were not so much injured in the panic of 1907 as were the business men and laborers, tho I admit that — including myself — bankers were nearly frightened to death.

The manufacturer cannot quickly take in sail. He contracts for his material far ahead. His enormous payroll keep right on, involving immediate cash consideration. What does the most careful [illegible] constructed credit avail the business man if he finds when a test comes that the banks thru which he must use it are unable to grant him the ordinary facilities? The money systems of every other commercial nation on the earth have been revolutionized to meet such contingencies. Only the United States, the greatest commercial nation on the globe, has remained behind. We continue to suffer because we continue to use the old system which was hurriedly adopted in the middle of the Civil War, half a century ago.

This is the more astonishing because panics are the very nightmare of American business life, and because the experience of all the other nations has proved conclusively that these destructive convulsions, which have brought us more misery and suffering—except in loss of life—than all of our wars, are due directly to our defective system of banking and currency and are entirely preventable. Why then should we alone, the greatest in resources, the greatest in the possibilities of our country, permit ourselves longer to suffer from these constantly recurring destructive business convulsions?

The American people have been slow to believe that it was all due to our defective banking system. Many other excuses have been advanced. In 1873 it

was too rapid expansion in building. In 1884 it was over-speculation unduly inflating prices. In 1893 it was the prospective tariff changes. There have always been excuses which have been accepted as the cause; but they were only excuses—literally excuses. Other nations have the same conditions just as frequently. They have had bigger single failures, as the result of these same excuses, during the past fifty years, than we, in the United States. But while, under their system, they have been able to meet the emergency, confine it to the locality where the trouble originates and to those directly interested, on the other hand, with us, the first sudden danger signal sends fear and panic from one end of our country to the other, with runs on banks everywhere, calling in of loans, refusal to extend credits—at the only time when they are a life-and-death necessity—throwing of stocks, regardless of loss, on the exchanges, factories closing, railroads in the hands of receivers millions of laborers out of employment and millions more under reduced pay; because the banks, which should be the safeguard of credit, and which are everywhere else in the world—especially in time of stress—because the banks, under our faulty system, have been forced, for self-preservation, to temporarily suspend, until the storm is over. The banks can emerge all right, but millions of dollars have been lost and inestimable damage done which years will not rectify, to the business interests of the country which were in no way concerned and in no way responsible.

The banks simply followed the course of absolute necessity under the law as it stands. There was money enough in the country, but it could not be made available. The excuse, whatever it was, which started the panic would have failed as completely, as the same excuses always fail in other countries, except that thru our defective system the banks are rendered powerless at the moment when their strength is a vital necessity. They know it. The people know it. And only for this reason do we live in constant fear of every depression lest it develop into disastrous panic.

In many respects we have the best banking system which could be developed to meet the needs of our great country. We have over twenty-four thousand individual banks in the United States—more than exist in all the other countries of the world put together. And in my judgment, this free banking system whereby every city and every town may supply its own banking facilities has been one of the great means of building up this country. We should not for one moment advocate any measure of reform which can impair, destroy, or tear it down. Whatever merits there may be in the system of branch banks—and there are many—it is not for us. We must not for a moment consider the possibility of reorganizing our present system in that respect, for it is too great a safeguard of local interests as it is and is too thoroly in accord with the customs and characteristics of our great country. But splendid as our system is in many respects, it fatally fails in time of trouble, and it even fails, as in 1907, to bear the weight of our prosperity. This is where we must reform it.

First, and most obviously, we lack leadership. We need it in our system more than any other country on the earth, for the very reason that we have these twenty-five thousand individual banks, where other nations count their independent banks by tens and twenties. I do not mean a self-appointed leadership, capable of not always being disinterested; but a leadership under regulation of law, which is public and open and responsible to the people for its conduct of business. Every bank in the United States is bound first of all to look to its own safety and its strict observance of our banking laws. If danger threatens it must call in its loans, hoard its surplus, lock its vaults against extending credit. It must do this for self-preservation, lacking any lawful leader to take precautions for the general good, and in the very act it precipitates the panic against which it would guard.

We have no leader in this country to conserve and protect our gold supply for the general good. The reserve system of the United States is practically one to *compel* panics when there is the slightest excuse. We are the only great nation in the world where the law requires the individual banks to keep their own

cash reserves and where there are so many banks that means the locking up of an enormous sum. There are $14,000,000,000 on deposit in the banks of the United States, which means a cash reserve of $1,400,000,000, scattered about in small sums and by law and conditions made utterly useless in time of trouble.

During the panic of 1907 we had in the Treasury of the United States nearly $1,000,000,000 in gold—the greatest and most useless store of gold in the world. Under any proper system of the central issue of bank notes we had gold enough right there to supply all of our needs many times over; but in spite of it and of the billion and a half dollars stored in the vaults of the banks we were obliged to turn in dire distress to the little nation across the sea for help and draw gold from the Bank of England to save us. The gold reserve in the Bank of England, which is the reserve of all the great banks of the country, was only $165,000,000. The rest of the banks carry only till money in their vaults. The $165,000,000 was not only the reserves for all the deposits of Great Britain and the deposits of the banks' own customers, but it included the gold upon which the bank notes were issued.

With all the millions upon millions locked up by law in the Treasury and the bank vaults of the United States we had to draw $100,000,000 in gold from the Bank of England to help us out of our distress. The people of England knew it, and they knew that their individual banks had only till money in their vaults. But did it start a run on any of those banks? Did the holders of those notes rush to present them, to see if they could get them redeemed? Not in the least. The Bank of England, as the official leader, responsible to the people for the credit of the country and the stability of its banking system, simply began raising its rates of discount—bids for gold—till it finally reached 7½ per cent., and gold flowed into the Bank of England from twenty four countries glad to take advantage of the opportunity.

Our people do not have confidence in our system because we have no responsible head. Neither have our bankers confidence in it, because each bank must be its own defense, because, under existing laws, there can be no official, legal leader, responsible for protecting the gold reserve and sustaining the credit of the whole country.

There are other vitally important functions performed by the great central banks of the world, from the loss of which we seriously suffer—the note-issuing power, for example. We must depend upon the note-issue for elasticity in our currency; but our system absolutely lacks flexibility. Our supply of bank notes to meet the reasonable demands of business bears not the slightest relation to those demands, because the note-issue is hooked by law to bonds. Banks take out circulation or reduce circulation simply for the reason that there is profit in the sale or the purchase of bonds required by law as the security for notes. If, in 1907, $100,000,000 could have been promptly thrown into New York City, at the inception of the panic, it would have been like throwing a bucket of water on a lighted match. But there was no bank with the right to, the power to, or the incentive. All of our banks are legitimately money-making institutions. The great banks of New York are, today, the ultimate reserve agents of the country. The centralization of banking is as inevitable as the law of gravitation. But these banks are not fitted to perform the functions of a central bank. They should not be forced to. They fail, of necessity, in time of stress. It is their business to pile up dividends. They are not equipped for the duties of a central bank and it is a legislative impossibility to so equip them.

The $100,000,000 which we imported during the panic was in gold, but it was worth no more to us than so many greenbacks. It did not bring quite so high a premium in New York as bank notes. Under a proper system, that gold, in a central bank of issue, would have been the requisite basis for the issue of nearly three times the amount in notes—or one-third of it, held as a central reserve, would instantly have served the purpose of the whole, without waiting for the panic to spread.

Of course, it is much easier to agree upon the defects of our system than to agree upon a remedy. The average

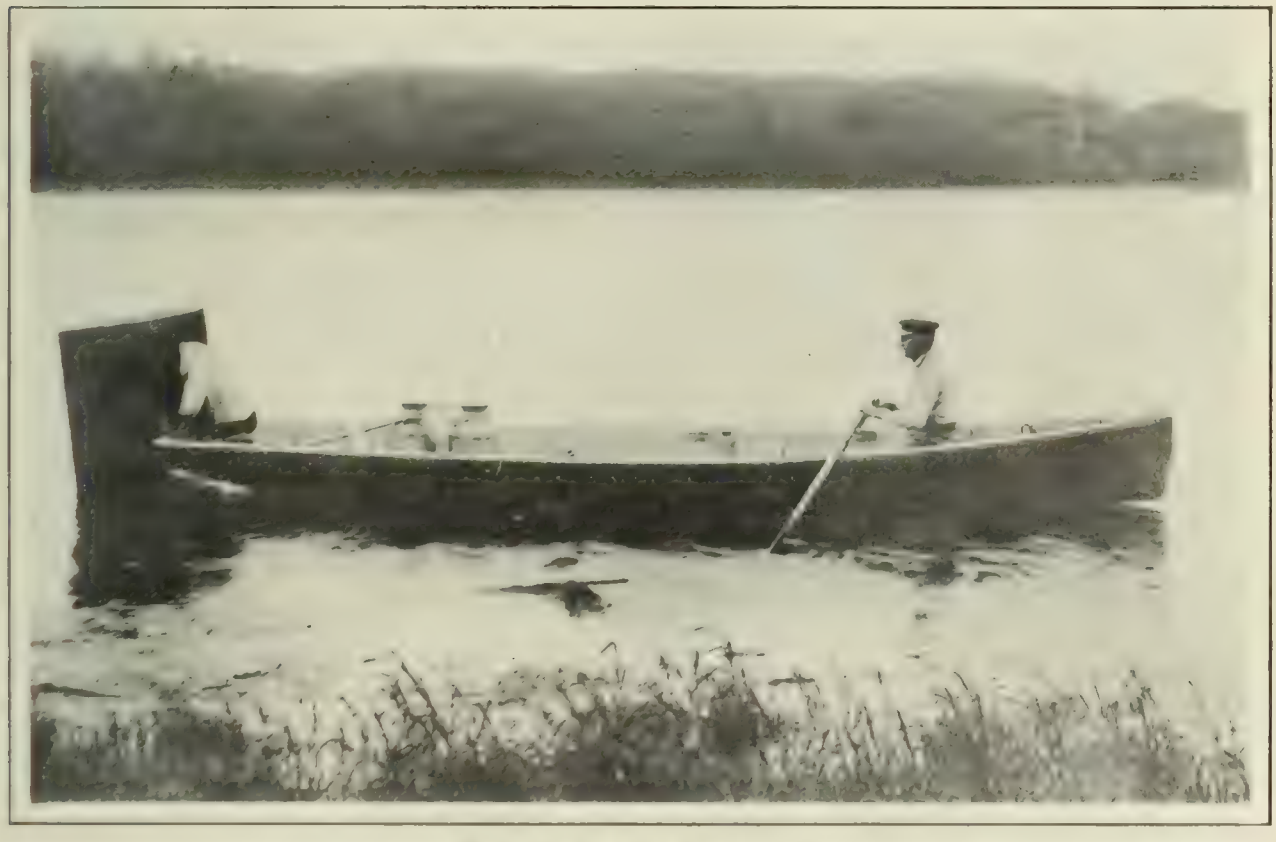
American citizen scouts the idea that he cannot, over night, develop a perfect monetary system. But whatever the details, two things which we lack are absolutely indispensable. The basic principles of all the systems of every commercial nation of the world, except our own, are the centralization of note-issue and reserves. And some time, I do not know how soon—I hope it may be next year, but it may not be in ten years—some time, as surely as the day follows the night, the United States is going to be compelled to adopt those principles to meet the absolute necessities of the great and growing business of America. We must have a central institution to hold the reserves of the country and issue the currency, under the strict supervision of law and responsible directly to the whole country alike. It must be a bank of banks—of all of the banking institutions of the nation, under proper restriction of law. The stock and voting power should be restricted to and distributed in even proportion among all the banks associated. Treasury officials should be upon its board of directors. Its dividends should be limited to 4 or 5 per cent., at most. It should pay no interest on deposits. It should have the discount power—the power to extend credit liberally in time of stress, where it is deserved. Such an institution would be in no way a competitor of banks but rather a keystone to our banking arch, for the mutual benefit of the banks and the people.

Only those who have given the matter little thought can raise the objection that we would be setting up again the Bank of the United States which Andrew Jackson strangled; for the central institution which I have outlined is exactly opposite to the central bank which existed in Andrew Jackson's time. That bank was a great private monopoly. No charter could be given to any other bank during its existence. It was solely a money-making machine. It was the enemy and competitor of every other bank in the country. It had branches in every city and did a regular banking business with the people, with the prestige of the Government as a stockholder. And yet, with all of these defects—for which, if they could not be cured, Andrew Jackson did well to strangle it—with all its faults, its score of years of life covers the only twenty years in our history without a financial panic.

Equally absurd is the cry against monopoly. There cannot be a dangerous monopoly on an income limited to 5 per cent. If by law, tomorrow, we were to limit the income of the Standard Oil Company to 5 per cent. and say that all over that should revert to the Treasury of the United States, we should instantly do away with any danger from a Standard Oil monopoly.

Some say that Mr. Morgan and the great combinations of wealth would control the situation and dominate the country if we set up such a central institution. First it might be well to ask who dominates the money situation in the country now? Then I assert that if the American people have not brains and ingenuity to put upon the statute books a law creating such an institution in a way to render it impossible for any interest or combination of interests, financial or political, ever to gain control of it, we do not want it. We shall all agree there.

We have centralization, today, largely in the hands of the Standard Oil Company and Mr. Morgan. We are bound to have centralization of some kind. What we need and what we are endeavoring to secure is centralization under the law; under conditions which will make it directly responsible to the people; clothed with power which shall operate for the benefit of the people, the integrity of the banks, and the credit of the whole country, at home and abroad, under all circumstances, always. Such an institution is as possible as it is necessary. Sooner or later we shall have it.



The sooner the better.

WASHINGTON, D. C.

# The Wealth of the Waters

BY B. E. POWELL

WHOEVER adds to the fish population of our waters adds materially to the money value and incalculably to the joy value of the world. Yet civilization has decreased rather than increased the fish population. The conditions that make for prosperous fish life, particularly in the rivers, are not yet thoroughly understood. Mysterious failure has very often attended efforts to increase the fish population.

ON THE BREEDING GROUNDS

Little effort has been made to understand the conditions governing the fish life of streams. Ever since the days of Darwin men have gone to the seashore to study; lakes have been industriously investigated; but a river with its varying situations has seemed too complex a subject for study. At present there are but two river biological stations in the world. One is in Russia, the other upon the Illinois. The one upon the Illinois is the older, having been established in 1894, and the work accomplished proves that a river is not only a possible but a profitable subject of study.

The man whose thought found expression in this laboratory which like certain brands of soap is unique because "it floats" is Dr. Stephen A. Forbes, Professor of Entomology in the University of Illinois and Director of the Natural History Survey of the State. The work is done with a view to economic as well as educational applications. Because the Illinois is broadly representative of most of our large rivers the results obtained from the study upon it are of moment to every one interested in the fish life of streams.

The Illinois is two hundred and seventy miles in length, and has in its basin twenty-nine thousand square miles. By reason of geographical and physical peculiarities it is one of the great fish-

FILLING THE LIVE BOX FROM THE SEINE

producing streams in the world. One hundred and twenty-eight of the one hundred and fifty fishes found in the state of Illinois are found in the Illinois River. About three dozen of these have a value in the market, and at least half a dozen are among our most prized fresh water fishes. In one year recently eleven thousand pounds of the delicious wall-eyed pike or jack-salmon, were taken from the Illinois. Twenty-four million pounds of fish this stream yields annually. The greater part of it is bought by eastern markets and its wholesale value is about $748,000. Only $283,000 in capital is invested to catch this return and employment is furnished 1,767 men.

One of the most important facts of fish life was settled definitely in the Illinois laboratory. This was the importance of plankton to the fish population. Plankton is the minute plant and animal life held in suspension by all waters. All fish-producing waters hold an enormous amount of plankton. Quantitative examination of the plankton moving down stream past Havana, where the floating laboratory was stationed, revealed the fact that the plankton reached the astounding aggregate of seventy-five thousand tons each year, about fifteen times the weight of the fish taken from the stream during the same period. Now Nature was not amusing herself when she was producing this plankton; she was preparing baby food. For it was found that when young virtually all fishes feed upon plankton; consequently the number of young fishes that can survive depends upon the plankton nourishment held by the swelling bosom of their big wet nurse. It follows that, since plankton is the baby food of practically all fishes, all which hatch at about the same time in a given situation enter into competition for food at the most helpless period of their lives. Hence worthless fishes, that is those which are of no value in themselves nor as food for others, are a distinct menace in that they lessen the supply of available baby food. Such fishes are the worthless and tough-hided gars with which the Illinois teems.

Now Mother Nature if not interfered with arranges marvelous harmonies. One of these had to do with fish life. The greatest development of the plankton, the flood times of the streams, and the spawning of the bulk of our fishes, all occur at the same time or in quick succession. In the low waters of midsummer it was found that the plankton of the stream fell off to little or nothing; but as the fishes were past the "baby food" stage the waters could be lazy with safety. But why was the plankton more plentiful in the spring when it was needed? Only this last summer the Illinois investigators succeeded in establishing the fact that the most of the plankton is produced in the backwaters. This explained why, after the opening of the Chicago Drainage Canal in 1900, the plankton content of the Illinois was enormously increased. The level of the river was raised about two and one-half feet, which enlarged the extent of the spring overflow, and the greater the supply of plankton, the better the prospect for a heavy fish population. While flowing streams often carry an immense amount of plankton, this presently perishes in our great silt laden rivers. The fish-producing capacity of a stream is thus proportionate, other things being equal, to the extent and fertility of the backwaters accessible to it at the hatching time of fishes. The plankton content of a stream at that time is an excellent index to the productive capacity of the waters as a whole.

Since this importance of the backwaters to fish life has been established, one can see that civilization with its reclamation projects may mean death to vast numbers of fishes. Civilization alters the face of the earth, but it changes the very "innerds" of the waters. A farmer may drain a few acres of bottom land and raise enough more corn in the course of years to buy an automobile; but many,

WHERE FISH FEED AND BREED
Permanent overflow of the Illinois River bottoms

many thousands of dollars worth of fishy babies may have gone to pay for that automobile. They come into the world to find no nourishment ready for them and they wriggle out of life as silently as they wriggled in, and unknowing humanity is the loser. It is fortunate for our fisheries when these bottom lands come under the control of hunting or fishing clubs, for then they are insured against human ignorance and avarice. Another device of civilization to do away with backwaters is shutting a stream into its main channel. There are those who would recall the Illinois from its comfortable wanderings and confine it in its channel in order to make of it a great artery of commerce. Those who should know say it could not be done, that commerce will have to get along without the help of the meandering old Illinois; yet there are many who would hazard the experiment. The loss to our fisheries would be very great, were the attempt made. Indeed, it makes one willing to say with Dr. Forbes that

"the time has come when the State should consider seriously the policy of preserving adequate breeding grounds and feeding grounds for our river fishes, even if it has to acquire and maintain them, since these waters are in imminent danger otherwise of being practically depopulated."

A word as to the commonest method of attempting to increase the fish population of streams, that is hatching and throwing into the waters large numbers of fishes to find life or leave it, as they may. An understanding of the importance of plankton shows that this is lamentably ignorant and cruel. The plankton content of the waters may be insufficient to support an additional life and the attempt is foredoomed to failure. The presence of baby food for the fishes should be ascertained before their lives are sacrificed to the experiment; moreover, attempting to populate streams with fishes without knowing the situations they affect is ignorant and deserves failure. Many fishes, for instance, cannot live in turbid waters. Throwing them into it is careless waste.

The Illinois laboratory has found interesting results in its investigation of the effect of sewage upon the life of the waters. When one thinks of the tremendous outpouring of sewage into the Illinois River from Chicago, not to mention the other very considerable towns along its banks, one wonders if any fish that swims it can be a fit candidate for the frying pan. It is, thanks to the ceaseless activity of certain minute organisms, very fit. These organisms are the bacteria and protozoa which as soon as the organic wastes enter the waters lay hold of them and begin the work of transformation. This transformation continues step by step until the wastes are changed into the flesh and bones of fishes and man opens his purse in the fish market to buy that which in another form aroused his disgust.

There is, however, danger in sewage. Streams may be loaded with more than they can digest and poisonous gases may be produced in injurious quantity; decomposing masses may accumulate and contaminate the waters continuously; the life system of the stream may be up-set and fishes suffer as a consequence. It is for this reason that careful, expert studies are needed, that no serious mischief may arise without due notice to all concerned, and such studies the Illinois station is engaged upon.

The opening of the Chicago Drainage Canal has in more ways than one influenced the fish life of the Illinois. Mention has been made of the increase in plankton; it has also cleared and cooled the waters making the river a more acceptable home for certain fishes. Of these is the ringed or American perch one of the best pan frys under Heaven. It is deservedly popular for it can be caught by the veriest tyro of a fisherman, rising to almost any kind of bait in any kind of weather. If the fishing fever attacks a man in winter he can chop a hole in the ice and be reasonably certain of a few ringed perch. But the Drainage Canal also threatens danger thru the establishment of manufactories along its banks. Pennsylvania and Massachusetts have poured chemical wastes into certain of their streams until they are completely depopulated. The States are now seeking thru legal restrictions and administrative control to restore the conditions of nature.

In many of our streams a biological revolution is taking place as fraught with

interest in finny annals as the Norman conquest in our own. This is due to the introduction of the prolific and aggressive European carp. Just how far the forced multiplication of any fish may proceed without upsetting the balance of life in the waters and thus reacting against the very kinds for which protection is sought, is still a partially unsolved problem. The Illinois laboratory has, however, the record of several years of observation upon the habits of the European carp. The laboratory has also gained in the course of years a fairly exhaustive knowledge of the fishes of all descriptions to be found in these waters, together with an approximate knowledge of the relative abundance of each in average years; a knowledge of the preferred haunts and usual range of the various species of fish and some acquaintance with their annual migration movements; a mass of data concerning their associations one with another in the same situations and at the same time and the competition for food and other necessities which the associations express; a fair acquaintance with both the average and the exceptional food of many of the species including most the really important kinds; a considerable body of information concerning their breeding habits and their spawning times and places. Of the interest of the work listen to Dr. Forbes:

"By such studies one gets a vivid idea of the individuality of the river as an organism, of the complexity of its structure and the sensitiveness of its physiological reactions. A stream like the Illinois with its flowing current, varying in rate in different parts of its course, variously fed by streams, by lakes, by marshes, and by underground springs, temporarily influenced and often profoundly affected by local storms, by drought, by floods is a very different subject of study from a lake, and to me a far more interesting one. A lake is sessile, simple, stolid, coelenterate; a river is motile, complex, sensitive and articulate; a lake has an aspect, a constitution; but a river has a character, a behavior. The river has also a special attraction to the student of biology in that it is more readily analyzable than a lake into distinct and largely independent sections or states, which can be studied separately and as a series."

URBANA, ILL.

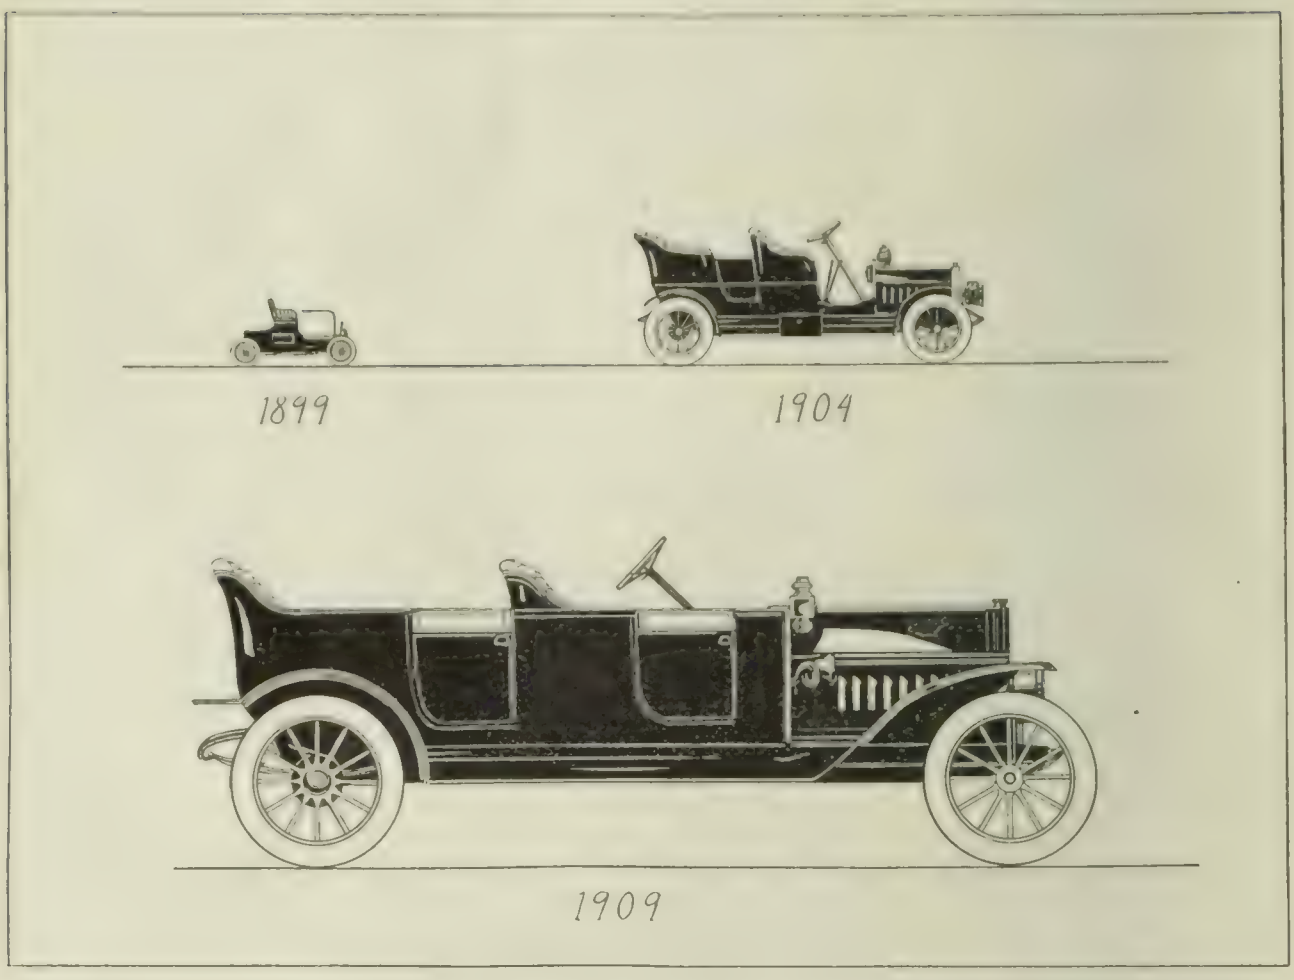
# The New Citizen

BY MARY BRECHT PULVER

He comes with neither pageantry nor pomp.
No embassy of welcome waits for him,
No outstretched hand in greeting, hails him here,
He comes unsung, a simple daily thing
Here where the great ship docks in homeward flight,
Where all the air is filled with lusty sounds;
A babel-blend of motley jargoned tongues,
Of creaking wheels of derricks shriek and groan,
Of throbbing engines, siren, whistles, gongs
Nor cares he. Naught to him the alien sights,
A velvet-eyed brown baby boy, asleep,
Close nestled on his swarthy mother's breast,
Her kerchiefed head protecting bent to his.
Long lashes curled on rounded cheek repose,
Nor lift—save at his mother's crooning voice
Here at a moment's halting on the deck

"Close thine eyes, bambino,
Little son of mine,
Mother's arms are round thee
Her cheek pressed close to thine
Goat-bell on the hillside,
Children's voice at play
All these sounds are silent
Vanished with the day."

O little boy who come across the sea
To seek a newer land—new destiny,
What shall we give you? Civic love and pride?
A fair and open chance? An equal hope?
A righteous land well governed, well regimented?
Just courts of law?—unpurchased equity?
A flag that stands for freedom and uplift?
Take, then, for welcome all the hope of these
And may your hands find fitting work to do,
To play a noble part however small
In weaving the fair fabric of the land.
And for the rest we join the lullaby
Your mother whispers in your drowsy ear,
Here on the threshold of your unknown world



"Sleep! For Mother watches,
Jesu watches too,
And the pretty angels
Up amid the blue.
So till dawning cometh
Lie thou on my heart,
The Madonna keep thee
Her little one, thou art."

DEPOSIT, N. Y.

# The Automobile Industry

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

NO industry shows a more remarkable growth than that of the manufacture of automobiles. In 1899 the value of the machines produced was $4,500,000. The value of the annual product for the year 1904 was $24,600,000, and during the year 1909 it reached the tremendous total of $165,100,000. The increase therefore from 1899 to 1909 was over 4,000 per cent.

In 1899, 3,723 machines were manufactured, while in 1909 127,289 were placed on the market. More than half of the machines in 1909 were manufactured in Michigan, and this accounts for the remarkable growth of Detroit. The next three States in order of size of production are Ohio, Indiana and New York. Of the machines manufactured in 1909, 121,000 were gasolene, 3,600 electric, and 2,400 steam. The principal change in the last few years has been that while the steam machines exceeded the electrics in 1904, they have now fallen to third place. That the manufacture of business vehicles is still in its infancy is shown by the fact that in 1909, out of a total of 127,289 machines, 102,505 were pleasure vehicles and only 3,288 were business vehicles. The most common form of pleasure vehicle is the touring car, of which over 76,000 were manufactured in 1909. Next comes the runabout, with over 36,000. Over 50,000 of the pleasure vehicles had horsepower of between 30 and 50.

The statistics for the manufacture of most of the articles in this country for 1909 are not yet available, but some idea of the magnitude of this industry can be had when we realize that in 1900 the value of all the ships built in this country during that year was less than $75,000,000; of locomotives about $27,000,000; of carriages and wagons $121,000,000; of bicycles $31,000,000; of sewing machines $21,000,000; of typewriters $7,000,000.

## The Long Roll

Every admirer of Mary Johnston is advised to read her new story.* If you do not like it, the fault is with you, not with this advice nor with the book. It is not only her masterpiece, it is probably the most remarkable description and interpretation of certain military events that has appeared since Hugo wrote of the Battle of Waterloo in "Les Miserables," and it contains what probably no other writer has come so near giving, a dramatization of what may be called the private life of a great army, with the heart of it in one man's bosom and the head of it on one man's shoulders. God is certainly no respecter of persons when He takes a notion to endow one with a minie-ball power of words and the gift of dramatizing blood-stained dust. Miss Johnson is a small, exquisite-minded woman, and said to have the usual Southern woman's passion for fine lace and diaphanous effects. But the genius that conceived and worked out this story is unshaved, masculine, ragged, barefooted, powder-grimed, hoarse with battle cries, ferocious and unconquerable. It is a sort of psychic phenomenon, the survival in a delicate woman of the same spirit which marched in men along the Valley Road with Stonewall Jackson's troops fifty years ago, swearing, singing and fighting victoriously against tremendous odds. *The Long Roll* could no more have been written by an ethically trained New England maiden than Homer's "Iliad" could have been written by a school teacher. And, of course, God only knows which, in the long run, will prove of most service to mankind—the "Iliad," or the poor pronoun teacher of mere adverbs!

The scenes of this book are laid up and down the Valley of Virginia with Stonewall Jackson's troops. The time covered is the first three years of the Civil War, thru the Battle of the Wilderness, and ending with the death of Jackson. The three principal characters in the story are General Jackson, his army and the Valley. The Federal army appears, but it is merely the blazing background upon which the mysterious personality of Jackson is thrown from time to time, a dark and tremendous figure in vast relief. The effort to interpret the real mind and character of this man is the leading purpose of the author. He is the one hero the South has ever produced that showed no distinctly Southern traits in the quality of his heroism; he was simply a cool incarnate military genius who might have been born anywhere in the world and at any period of its fighting history; his nativity might have been anywhere upon the flank of a hostile army. He had a sharpshooter's relation to Providence, very real, very pious. A man with a conscience so exacting and so military that he might have demanded a court-martial for himself in Paradise, at the same time so elastic where his enemy was concerned that his unscrupulous efforts to deceive and divert attention from his own movements and to take advantage of the foe are often appalling.

The question raised by Miss Johnston's story is whether Jackson was not at times more than half a madman. And it has often been raised before. When a man is born with sufficient will power to perform the impossible and the incredible, he is too severely sane, to say the least of it, to be accepted as a normal man. And this was the truth about Jackson. He had a theory that if he could train his soldiers to stand before great odds, and to keep on standing, and not to retreat even when they ought to retreat, these soldiers would become invincible. You may kill such men, but you cannot conquer them. And he put his theory into practice with a success that proved it and left him forever under the suspicion of madness.

So far as this writer knows never before has the talk, the natural man-talk of soldiers, on the march, in the trenches

*The Long Roll. By Mary Johnston. New York. Houghton Mifflin Co. Price

advancing, retreating, fighting, resting, all, been set down and kept up from page to page throuout the story as it has been done in this book. The effect has been to impart a humanness to a great body of men as vivid and natural as if she portrayed in Jackson's army one marvelously interesting composite character. And the Valley itself is their faithful lady-love whom they adored, and who stripped herself and starved herself to nourish them. The individual men and women who appear are merely the symbols of this great whole, delightfully delineated, and sufficiently interesting to hold the attention even of the mere novel reader. But the significance of the book lies in the power with which the author has resurrected the past, fitted it to history, and brought life and a great manhood out of what has been dust for nearly fifty years. MRS. L. H. HARRIS.

## Jeanne d'Arc

*La figure de Jeanne, debout aux confins de deux âges, s'illumine d'un double reflet, baignée aux dernières lueurs du moyen âge qui tombe, dorée des premiers rayons de la Renaissance qui se lève. Sa vie est une suprême chanson de geste; mais, quand elle fleurit, Louis XI, le maître des grands réalistes, est né.*

THESE words, quoted from the preface of M. Hanotaux's biography of the Maid,[1] may well serve as the epigraph of this insufficient notice of several new books inspired by her career. Incidentally, they serve as some slight indication of the style of the historian, who, whatever he may have said about "scientific" history (we do not remember how he has exprest himself on this question of "high actuality"), at least does continue the tradition of treating history as an artist does the human figure—an artist, that is, who respects truth as well as beauty of line.

M. Hanotaux tells us that his study of the heroine is not by any means definitive. He adds that what we know of her is almost nothing; that the definitive life must be the work of one who has checked up the monumental *Procès* of J. Quicherat, and who has delved deeper than Quicherat himself in Italian archives, especially those of the Vatican and the religions orders. It is to be hoped that we shall have this final work at one time or another. Its authors must in any case have studied the English and Scotch archives, thus far neglected by historians of Jeanne d'Arc. Meanwhile, M. Hanotaux's book comes very near to making us forget the lack of the ideal one.

For one thing, he is no partisan, tho the nobility of Jeanne is by no means wasted upon him. We confess to being weary of polemics on this theme, even when Anatole France on the Continent and Andrew Lang in Great Britain have put on armor and entered the lists, and tilted, too. An echo of the controversy comes to us in the volume of Léon Denis, *La Vérité sur Jeanne d'Arc*—an attempt at refutation of France, Thalamas, Berenger and the other mouthpieces of disparagement.[2] The keynote of this last volume is struck in the sentences: "Most phenomena of the past, affirmed in the name of Faith, denied in the name of Reason, can henceforth receive a logical, a scientific explanation. The extraordinary events which filled the existence of the Maid of Orléans are of this order." M. Denis presumes to add that his chapters "become, as it were, an echo of her own voice and of the voices of Space." For him, at least, the phenomena of the Maid's triumph over men and matter, and her visions themselves, "are explained today by the laws of mediumship." But she was "neither hysteric nor neurotic." Michael, "God's might"; Marguerite, "the precious pearl"; Catherine, "the pure virgin"—in fine, "her voices" were all "symbolic names characterizing a moral beauty, a superior force, and reflecting a ray of God."

In M. Denis's book one reads this sentence quoted from Jeanne's reply to the clerics who examined her at Poitiers: "I read in a book where there are more things to be found than in yours!" It is the theory of a third writer on the Maid that, while she was, at Poitiers, the illiterate peasant girl of fervent faith and aspiration described in all the histories, she learned, in the course of the winter of 1429-1430, how to read

[1] JEANNE D'ARC. *Par Gabriel Hanotaux, de l'Académie Française.* Paris: Hachette et Cie. 7 francs 50.

[2] LA VÉRITÉ SUR JEANNE D'ARC. *Par Leon Denis.* Paris: Paul Leymarie. 2 francs 50.

and write. This is the hypothesis of the Comte de Maleissye, a descendant of Charles du Lys, grand nephew of Jeanne and a contributor to the *Deux Mondes*. He treasures three letters of hers, the only ones which bear her signature, and comparing them with two other (unsigned) letters of her dictation, he adduces strong circumstantial evidence that she was not, at the time of her capture and trial, the ignorant peasant of tradition. His contribution is one of vivid interest. We recommend it to those students who have access to the original documents and can judge it upon better grounds than plausibility.

Our last word must be of M. Hanotaux's life. It is far more than a life in the narrow sense of the word, for he undertakes to render the times as well as the principal figures in the *chanson*. He succeeds, too — and far better than M. France, in one respect. There is no distortion of the image by a too malicious, too cynical interpreter. (Anatole France creates literature, but not history.) The writer enriches his volume, which is typographically admirable, with a great number of woodcuts. "Those old-time artists, are they not the best of illustrators?" he asks. The woodcut of which we offer our own reproduction here is, however, after a Spanish engraving of 1562.

And if any one ask the question of Villon—

*Et Jehanne, la bonne Lorraine,*
*Qu'Anglais brûlerent a Rouen,*
*Où est-elle, Vierge souveraine?*

—the answer is: in Hanotaux.

❧

**Artistic Homes. Handicrafts in the Home.**
By Mabel Tuke Priestman. Chicago: A. C. McClurg & Co. $2 each.

The name of Mabel Tuke Priestman is authoritative in matters of artistic home making, both from the outside and from within. Her work is well known to the public thru the magazines of country life, the women's periodicals and art journals. From these much of the material forming the two volumes under consideration is reprinted. In *Artistic Homes* the author has followed the practical scheme of presenting homes already existing instead of giving a theoretic treatise on building. The material covered is wide in range: historic homes, homes of distinguished people, styles of architecture, from the purely colonial to the Jersey bungalow, the inevitable house remodeled from a stable, the "barn that found itself," the seaside home, the suburban home and the commonplace city house, and how to make it attractive. The author's avowed endeavor in the introduction to her *Handicrafts* is "to show how certain crafts may be done quietly in the home by mother or daughter, in town or country, as a relaxation." Perhaps; at any rate the present volume is invaluable as a supplementary aid to practical training. Yet one cannot help feeling that a danger threatens us in the general and superficial dissemination of craft work; namely, that modest homes shall be flooded with objects no less ugly than the enormities of the past. The whole theory of arts and crafts is opposed to such a calamity, but the actual fulfilment is toward it. Nevertheless, this volume is a guide to much beautiful work in a large number of handicrafts, of which the weaving, the stenciling and needlework on fabrics, and the pottery, promise desirable results.

❧

**The Japanese Letters of Lafcadio Hearn.**
Edited by Elizabeth Bisland. Boston: Houghton Mifflin Co. $3.

There have been few letter-writers in our literary history who stand higher than Hearn. Incapable of maintaining friendship for life, and thus in strong contrast with that equally eccentric genius, Edward Fitzgerald, the author of "Japan, an Attempt at Interpretation,"

AN IMPRESSION OF JAPAN BY LAFCADIO HEARN
Examples of the writer's wholly amateur sketches have been published only in the "Letters from a Raven," of some years ago, and in the "Japanese Letters." (Houghton-Mifflin Co.)

and "Kokoro, or the Heart of Things," had in unusual degree the gift of expressing his friendship in long letters full of beautiful pictures and earnest discussions of life and of the arts. Hearn the author toiled laboriously; his surprising methods are described in one of the confidential letters to Professor Chamberlain. Hearn the correspondent, on the other hand, seems to have found refreshment in composition. One who was always so ill paid for good work as was Hearn can have had little thought of writing for publication in addressing his friends. His letters gain thereby. The editor of this collection, who is the editor of the two earlier volumes of correspondence, has not considered it to be her duty to suppress passages wherein Hearn cries out, in disillusion, against the fading of the cherry-blossom Japan which he first found; against the discovery that this people is not all song-cicada and sunset, courtesy and beauty and altruism. Hearn would not have been lastingly happy anywhere. His was the incurable nostalgia of the romantic poet —the decadent. But his *Japanese Letters* fill one of the three or four really indispensable volumes published in the last year or two. As criticism, philosophic thought and self-revelation they richly reward that portion of the public intelligent enough to appreciate them.

**China's Story, in Myth, Legend, Art and Annals.** By William Elliot Griffis. Boston: Houghton Mifflin Company. $1.25.

Dr. Griffis's popularity as a lecturer and writer on Japan and China has a double reason: his unusual knowledge of life in the Far East and his unusual appreciation of our ignorance of the subject. Consequently he is able to provide the average American with just what he wants to know at the time when he wants to know it. We are beginning to realize that it is not only of interest but also of importance that we gain some information about how China came to be and what it is likely to become, and this

compact and comprehensive volume is well adapted to that purpose. Of particular interest are Dr. Griffis's views of recent events. He is very emphatic in his approval of the action of Admiral Kempff in refusing to join with the European Powers in the bombardment of the Taku forts, which attack resulted in converting the Boxer riots into a national anti-foreign movement.

**Studies in Galilee.** By Ernest W. Gurney Masterman, M. D., F. R. G. S., F. R. C. S., Jerusalem. With a Preface by George Adam Smith, D. D., LL. D. The University of Chicago Press. $1.12 postpaid.

Dr. Masterman's long residence in Palestine, his familiarity with the literature on his subject, and his frequent journeys thru Galilee, both in the practice of his profession and as a student of archeology and geography, have given him unusual qualifications for writing this interesting and informing book. His descriptions of the life of the people are limited mainly to those industries and customs which have a bearing upon biblical subjects, but his discussions of the physical features of the land, its ruins and resources, especially in the region around the northern end of the Sea of Galilee, are very full and clear, giving the careful reader a most entertaining picture of that part of Palestine. Dr. Masterman's arguments for the identification of Tell Hum, or, as he believes it should be written, Telhum, with the site of ancient Capernaum, are quite convincing, based as they are on a study of the literature as well as a careful investigation of the topography and remains of this and other places which have been put forward as claimants for this honor. Perhaps the most valuable part of the book is the chapter on the ruins of the ancient synagogs in Galilee, for this is the fullest and best account of the subject we now have in English. Some few parts of these old synagogs, with their pagan architectural features, are still standing, but they are destined soon to vanish under the devastating regime of the Arab population. These interesting relics ought to be thoroly explored before their characteristic fragments are broken to pieces or disappear altogether in the lime kiln. The many well chosen pictures are of great value in illustrating

STONE CAMELS OF THE CHINESE PRAIRIE
From "China's Story," by Dr. W. E. Griffis

the text, but the absence of suitable maps is a considerable drawback in using the book.

**The Real Captain Kidd.** By Sir Cornelius Neale Dalton. New York: Duffield & Co. $1.25.

These writers of "real" biographers are very disconcerting. They would leave us neither heroes nor villains. Time was when historic characters were painted in black and white, but now the muckrakers and the white-washers have left us no names which we may hold up for veneration or obloquy without fear of contradiction. Marat, we are told, was a true patriot; Judas, an over-zealous disciple or a mere symbol; Francesco Cenci, a maligned gentleman, and now it appears that Captain Kidd was the innocent victim of political intrigue. Next somebody will be saying that the devil himself is not so black as he is painted. The author of this volume, a prominent British barrister, for twelve years Comptroller-General of Patents, produces evidence to show that William Kidd was not hanged for piracy but for murder, as he had struck down one of the mutineers who had vainly tried to force him to become a pirate; that he was not allowed an opportunity to defend himself; that the judge showed bias in his charge to the jury; that the Admiralty suppressed the papers that would have proved his captures legitimate; and that the real financial backers of Kidd's expedition were four of the King's Ministers; and that it was the influence of the East India Company which brought about his condemnation. On the whole we are inclined to think that the exceptions taken to the ruling of the court by this new counsel for the defense justify an appeal.

**The Aran Islands.** By John M. Synge. Boston: John W. Luce & Co. $1.25.

For the casual reader John M. Synge's book on *The Aran Islands* is a travel narrative full of zest, vivid portraiture and admirable descriptions of nature. The islands are a sea-washed, wind-swept group of rocks off the Galway coast of Ireland, and it was on them that Synge "found" himself—and found, too, the material for his dramas (see THE INDEPENDENT of April 13). In fact, the plot of more than one of the plays is directly adapted from stories repeated to the traveler by Aran Islanders, stories duly reported in the present volume. The illustrations from drawings by Jack B. Yeats are taken over here from the Irish edition, and an interesting introduction is contributed by Edward J. O'Brien, who has had the luck to interview, in America, some of the Islanders known to Synge himself.

**Switzerland.** By Oscar Kuhns. New York: Thomas Y. Crowell & Co. $2.

Professor Kuhns's *Switzerland* is a charming gift book. It tells little, if anything, about Switzerland that hasn't been told before. It has this advantage over many books on the same subject, however, that it bears every evidence of being thoroly trustworthy. The author sets out to give a concise account of the land of his own ancestors, its history, scenery and literary associations. He has accomplished his task within modest space, and the thirty odd full-page illustrations are without exception unusually beautiful.

**Memories and Impressions.** By Ford Madox Hueffer. New York: Harper & Bros. $1.60.

Pre-Raphaelism and the un-Victorian estheticism of the Victorian era seem nowadays to belong to ancient history: much more so, indeed, than do the Renaissance, or the real pre-Raphaelism, or the sculptures of the pagan Greeks. Ford Madox Hueffer, grandson of Madox Brown, seeks in his *Memories and Impressions* to revive the period and its art, at least in the personalities of its practitioners and devotees. For mere facts, however, the writer has a proud contempt. Mr. Hueffer makes an especial effort to persuade us that the real pre-Raphaelites were lusty, profane men, heavy eaters and redder-blooded than today's self-conscious iconoclasts. It was only the imitators of the seventies and eighties, he would convince us, who were frail and fastidious and absurd. Incidentally, he retails many good stories and puts to paper an invaluable store of

reminiscence. In these particulars his book is decidedly acceptable. We like his impression of Joaquin Miller in London, and his occasional lines of mild satire. "In gloom and amid horror they sang on bravely of Launcelot and Guinevere, Merlin and Vivien, ballads of Staffa and Scrips, of music and moonlight," he writes of the poets of the "movement." They did not, he continues, "much look at the life that was around them . . . they were not brave enough—that, I suppose, is why they are very few of them remembered, and few of them great." It is equally difficult to believe that pre-Raphaelism was once called blasphemy, and that Charles Dickens cried out loudly that the Brotherhood be clapped into prison. And to believe that we were once somewhat enthusiastic over the works of the men persecuted then, and today ignored.

SIR EDWARD BURNE-JONES

## Literary Notes

....Florence Hull Winterburn's *Vacation Stories* (New York: Fifth Avenue Book Company; 75 cents, 50 cents and $1) is a pleasant, bookish book, and not in the least useful or "practical."

The Pilgrim Press has made another valuable addition to its series of *Modern Sunday School Manuals* in a small volume by Prof. Irving F. Wood, discussing the problems of *Adult Class Study* (75 cents).

....The latest "Home Life" volume is D. S. Meldrum's *Home Life in Holland* (Macmillan; $1.75): a thoroly informing, pedestrian account of a little kingdom dear to tourists and old-fashioned painters. There are interesting illustrations.

....Sportsmen big and little will read with zest Caspar Whitney's *Jungle Trails and Jungle People:* "Travel, Adventure and Observation in the Far East" (Harper; $3). Large type and occasional illustrations from photographs are the grateful adjuncts of a lively style and a subject matter finely and exotically adventurous.

....In *The Temple Series of Bible Handbooks* Rev. W. H. Carslaw, D. D., has written a popular sketch of the life and work of *The Early Christian Apologists* (Lippincott; 30 cents). As far as space allows characteristic extracts from the writings of the more important Fathers are given and their lines of Gospel defence are stated.

....A movement is under way to purchase the Louisa M. Alcott homestead at Concord, Massachusetts, and to endow it as a memorial to the writer. The house stands about as it was in Miss Alcott's lifetime, but it needs thoro repairs. Subscriptions to the fund are invited, and may be sent thru Little, Brown & Co., the Boston publishers.

....If any one cares to try once more to demonstrate that Walt Whitman was a giant, we recommend the story of Whitman's imitators and disciples. Beside them, at least, Walt was divine. Such is one's conclusion after conning the pages of *The Great Companions*—a little book of prose and verse by Henry Bryan Binns (New York: Huebsch).

....A book of love, with chapters on the various kinds and ages and stages of the passion, compiled from poets and prose writers—what say you to that? Perhaps we may each of us be counted on to make our own book of love—but if not, here is a catholic selection ready made. There is an introduction by Madison Cawein, and decorations by Wladyslaw T. Benda, and writers so recent as Zona Gale, Owen Wister and H. T. Finck are represented. (*The Book of Love.* New York: Macmillan. $1.25.)

....In Putnam's "Heroes of the Nations" series appears a one volume history of *William the Silent, Prince of Orange, and the Revolt of the Netherlands* ($1.35) by Ruth Putnam, author of a two volume life of this prince. The book is conscientiously and interestingly wrought.

....Duffield & Co. are the publishers of Augustus Thomas's *As a Man Thinks:* a play in four acts of which we spoke a word while it was still on the stage of the Thirty-ninth Street Theater in New York. The printed copy ($1.25) does not alter our opinion of the play as then exprest. It is well written and of real interest.

....*The Story Girl,* by L. M. Montgomery (L. C. Page; $1.50), is one of a group of eight thoroly nice children who live on a farm in Prince Edward Island the wholesome life of field, forest and orchard, picking berries and apples, telling stories by firelight, writing down their dreams in their dream books "to have them to read and laugh over when old and gray." No better or cheerier octet has appeared in fiction since Miss Alcott's "Eight Cousins."

....John Galsworthy's *The Little Dream,* "An Allegory in Six Scenes" (Scribner; $.50) is not an easy piece of work to qualify. It is not dramatic—but we are asked to accept it only as a fantasy. Its verse is commonplace; there is nothing novel in the ideas involved. Briefly, it is the dramatization of an Alpine maiden's yearning for both mountain peace and urban excitement—with a mountain lover and a transient mountain climber as exponents of the two ways of life.

....Minnie D. Kellogg's *Flowers from Mediæval History* (San Francisco: Paul Elder; $1.50) is an attractively made volume, of content somewhat helter-skelter, and to just what purpose we know not. The spelling of proper names is somewhat peculiar. We read, "Mt. San Michele," of an abbey in Normandy; some of the French names which escape Italianization are Anglicized ("August" Rodin; Rheims) while others remain conspicuously and even anciently French ("Duc de Bourgoyne").

....From the Neale Publishing Company come volumes entitled *Genealogy of Jefferson Davis, President of the Southern Confederacy, and of Samuel Davies, President of Princeton College,* by William H. Whitsitt, and *A Study in Alexander Hamilton,* by Fontaine T. Fox, one dollar each. There is in the former volume an offering of new documents; the latter is a running commentary upon earlier essays on Hamilton, and an attempt to blacken (or at least darkly represent) his moral character.

....A new edition of Dillon on *Municipal Corporations* is announced by Little, Brown & Co. Six years were spent by John F. Dillon, then a judge of the Supreme Court of Iowa, in preparing the first edition. The present edition consists of five volumes and cites 40,000 cases. (Octavo, law canvas, $32.50.) Judge Dillon has devoted in all over forty-five years of his life to the preparation and revision of this monumental work.

....The versatile Arnold Bennett once edited a woman's magazine, and some papers which he wrote for that journal are now gathered up under the title, *Mental Efficiency, and Other Hints to Men and Women* (Doran; 75 cents). Like the author's *How to Live on Twenty-four Hours a Day* this book is replete with common sense tersely put, and well. Mr. Bennett's subject matter is attractively forecasted in the table of contents: besides the chapter on Mental Efficiency are others on Expressing one's Individuality, Breaking with the Past, Settling down in Life, Marriage ("The Duty of it"; "The Adventure of It"; "The Two Ways of It"), etc.

....Another little book of flowers, this time of verse alone, is Alfred Noyes's collection, *A Poet's Anthology of Poems.* (New York; Baker & Taylor.) Mr. Noyes's introduction is somewhat baffling, but yet suggestive. "Great poetry," he writes, "brings us into touch, into communion, with that harmony which is the basis of the universe, the harmony into which all our discords are resolved." One of his selections is from William Blake. "Every flower," says Blake, "every tree—

[illegible]
numerable dance,
Yet all in order, sweet and lovely. . . ."

There is in Mr. Noyes's anthology a rather more definite expression of taste than most anthologies of English verse can boast.

....Prof. Ephraim Emerton of Harvard has written an outline of *Unitarian Thought* (Macmillan; $1.50) in which he seeks to avoid negations and present the positive doctrines of Christianity as generally held among Unitarians. It must be said, however, that the author's attempt has not been wholly successful, although his book is clearly written and contains much of an apologetic character drawn from [illegible]. In spite of his expressed determination to the contrary, it seems that Prof. Emerton could only set forth the positive in small quantities after dealing at great length with negations and criticisms. The method of contrast may serve to make more distinct certain issues and phases of Unitarian thought, but its continuous use leaves the impression that party opponents and the worthless of each doctrine oppose it are more important than the search for truth. Readers within the fold may read the book with smug satisfaction, but it does not contribute to our understanding of the deeper things of religious experience, nor will its perusal create enthusiasm for the Christian interpretation of the mysteries of life.

## Pebbles

PEACE is now raging in Mexico.—*Columbia State.*

MEXICAN suffragettes have begun to attack Madero. The insurrecto leader will now get a taste of real war.—*Baltimore News.*

REDOLENT.

SPECIMENS OF PROSE COMPOSITION.
By Robert W. Shameless.

As they stood there among the pulsating olive trees, with the scented black-and-gold butterflies crashing slowly about among the languorous clusters of the floating, nerveless gardenias, he took her slim, listless, curved ear in both his firm hands and crushed it tenderly, luxuriously. When the faint, fragile fragrance of hybrid hibiscus, mingled with the soft, heavy odors of hysteria and rotunda, drifted dreamily from her thick coiled hair to his, Deville, draped sensuously over a bit of glimmering silk, threw back his fine head and bayed like a hound. It was her own personal fragrance.

"And you—."

"I—know!"

"But—you will try—to care—Celerie?"

Her quivering face flushed rhythmically against his throbbing chest. He tossed his head lightly toward her. Slowly, unresisting, she picked it up in her slim, fragrant little hands, and for one supremely long pulsating hour held it over her head in both listless palms, glorious, superb in her surrender.

"It—is—all—over—with—us!" she cried. He kissed her eyes, her nose, her pink elbow, the tiny pale veins behind her delicate ear, as he crushed her deeper and deeper and deeper into the pulsating bookcase. And while every atom of her rhythmic being beat a confused pink assent, she wrung her lips, smothered little by little in the overwhelming, fragrant, agreeable, delicious, throbbing, pulsating, dreamy, nerveless, [illegible], quivering [illegible]. —*Harvard Lampoon.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra, to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## After the Coronation

KING GEORGE may now rest a little after his strenuous days of celebration and exposition of himself to the millions of his nominal subjects; and now the representative rulers, the two Houses of Parliament, have their turn to draw the attention of the real rulers, the people. England loves a fine show, and it has had it. A King is but a show, no more real than is the star actor in a play. He plays King; he does not rule, Parliament rules and he does what Parliament bids. Now Parliament takes a hand, and, having given the people a respite during the show, it must now settle the question what shall be done with the House of Lords. Out of courtesy the Lords are asked to consent to the suppression of their power of veto of a bill passed by the House of Commons, after suitable process, but they are plainly told that they must submit. Will they do it, or will they fight to the very last? That is the question which now agitates Great Britain.

Why should the House of Lords, consisting of only a few hundred gentlemen, all rich men, set themselves up to have their own way and thwart the will of the entire people of the Kingdom, as represented by the members they have chosen? It is abnormal; it is feudal; it is archaic; it belongs to the ages before the people had discovered their rights. Not one of the British colonies, inhabited by Englishmen, has a House of Lords. Canada and Australia and New Zealand and South Africa create no titled peers; their citizens are all peers—only the Mother Country lags behind its age. It is a matter of grace undeserved that the people, represented by the House of Commons, do not absolutely and utterly abolish the House of Lords and the whole system of titled dignities on which it is founded. What possible excuse is there for accepting the fiction that because a man is born rich, or has acquired riches, therefore he shall have the right to rule over all the moderately rich and the poor; and what nonsense it is that his eldest son, very likely the stupidest of the family, shall inherit the right to rule, to the farthest generation!

This simple idea, self-evident one would think, is beginning to be beaten into the thick British skull. But the people are not yet ready to take the really radical step; they will only insist that the Lords, who have no real right to rule, shall finally submit to the people, after resisting for a year or more and clogging unmercifully the wheels of government. Their final, ultimate veto of legislation shall be abolished. That seems reasonable, only decent, but the peers call it revolution and they threaten to resist.

Over the question of resistance the Unionist party is divided. There are those who insist that the House of Lords refuse to accept the bill, and declare that they will hold to all their ancient privileges as if they were actual rights. There are others, and the wiser ones, who see farther into the future and would yield in the hope of saving something. They know what the result would be of resistance. There might be once more an appeal to the people and the election of a new Parliament. But what good would that do? The people have just spoken and would certainly speak again in the same way. The coronation splendor has not drugged them. Once more and in desperate earnestness, the new House of Commons would present

to the Lords the same, or an even more drastic bill and they would force its acceptance even at the risk of the necessity of abolishing the House of Lords absolutely. But that would not be necessary; the Lords can be made ridiculous by swamping them with as many hundreds of peers created for the purpose as might be necessary. The King would have to create them if the House of Commons gave the order. He has no option and the Commons will be in dead earnest. Having thus first abolished the Lords' veto they would then proceed to reform the House of Lords itself, not as Lord Rosebery or any other Lord or Earl might wish, but as it pleased. It might take away the right of hereditary rule altogether, and constitute the second chamber of members elected for life or for a term of years, like the French Senate and ours. It is impossible to forecast which horn of the dilemma the House of Lords may take. Insanity may rule the hour rather than prudence, and it is an old saying that even Jupiter cannot foresee what fools may do. But this is absolutely certain, that the coronation truce is ended, like the truce of the animals at the river in a time of distress that Kipling tells of, and now the killing is on again, and will continue till the power of the Lords to estop reforms shall come to a total end and the House of Lords shall be utterly transformed so that it shall represent the people.

Lord Rosebery was right, but they would not listen to him. It is too late now to talk of reform such as he proposed. It is well for England that they refused when they might have averted the crisis. Lord Rosebery was their true prophet and adviser when the Lords rejected the Education bill. Their time has past. They can talk of refusal, of amendments against home rule or disestablishment, but they will not be accepted. Will there ever be another coronation when the people will have no part, the House of Commons slighted, and the Lords of the Realm and the Lords of the Army and Navy, and the Lords spiritual shall anoint the King, as if he were their King, and not King of the people? And when the Lords go how long before the King will follow? When will the farce end?

## Relations with Canada

CANADA and the United States are not to go on as greater strangers to one another than the United States and England or the United States and France. For one son of Uncle Sam who has seen Ottawa, Montreal and Quebec, a dozen have seen London and Paris; and at least five hundred daring Englishmen and a hundred or two of Frenchmen have landed at New York and ventured as far West as Chicago for every English Canadian who has "seen the States." French Canadians have found their way in large numbers into New England, to remain as American citizens, but that is another story.

This separateness of English Canadians from their kindred south of the lakes is not so much conscious aloofness as a habit, which they never think about at all. The great highways of the world's commerce pass thru London and New York, not across the Canadian and Mexican boundary lines. Americans make the Continental tour partly because it is "the thing" to do, and partly because of a real and fortunate craving to see something of the beauty and ripened civilization of older countries.

Trade relations account for more than we are commonly aware in the social life of a people. It is the rapid evolution of new economic relations between Canada and the United States that will bring about a much closer acquaintance within the lifetime of another generation.

The Grand Trunk Railway has obtained terminal facilities at Providence, R. I., and the Canadian Pacific, it appears, is for all practical purposes to come to New York thru control of the Erie lines. Some interesting problems of railway control are bound to arise in consequence of these developments. More important, however, will be the unnoticed changes of habit that will follow upon the actual acceleration of commercial intercourse between the two nations.

The tariff wall has been in fact a more effectual barrier between Canada and the United States than between the United States and Europe. How wide will become the breach that the probable reciprocity arrangement will make no one

can foretell by a mere study of schedules and the terms of treaties. It remains to be seen how people on both sides of the border will act. But it is a fairly safe prediction that they will discover that trade between Ottawa and New York or Michigan is much like trade between Ottawa and Manitoba or between New York and Pennsylvania. In the course of time the pressure to level the tariff wall completely and permanently will become too great to be resisted.

Meanwhile, significant shiftings of population are determining a new structure of society in both Canada and the United States. American farmers from the Mississippi Basin continue to find their way into the Northwest and Canadians into New England. One who studies the redistributions of ethnic groupings since the beginnings of European history is imprest by the strength of the tendency which, in spite of profound and repeated disturbances, holds the Mediterranean stocks to southern latitudes, and the Baltic stocks, in the main, in northern. It is on the whole probable that this tendency will continue to assert itself on the American continent. The English, Germanic and Scandinavian additions to our population will probably dwell north of the latitude of New York and St. Louis, extending northwestward thru British Columbia into Alaska. Our Latin and our Slavic immigrants from Southeastern Europe will, for the most part, live south of New York, and will probably more and more find their way into the industrially developing Southern States.

Then some interesting political changes may be looked for.

## The Address of the Class of 1885

THE Class of 1885 of Amherst College made itself famous thru the entire realm of American education by an address nearly a year ago to the trustees of the college. It is not a common thing for a class at its twenty-fifth anniversary, after its members have had time to know what they believe and want and are ripened by their experience, while yet remaining very loyal, to tell those who direct their alma mater that they fear they are following false lights, and to call them back to the tried paths of scholarly culture. This address was, as Colonel Roosevelt has said, one of the most notable educational papers of the day.

The substance of the argument and appeal was that our colleges and universities are wandering away from what was their chief purpose—that of giving a liberal education, one of general culture, and are tending rapidly to a technical education whose purpose is to specialize with a direct view to gaining a livelihood. It is proper, they said, that universities should turn out engineers, chemists and professional men in other branches, but there should be one college whose aim would not be to help its graduates to earn their bread and butter, but to gain general intellectual training and culture as the basis for a broad life and service to the state. For this, they declared, the humanities, so called, are essential; the old classical studies, based on Latin and Greek. They regret the passing of these languages in the preparatory schools, and the substitution for them of the "useful" studies. They asked that Amherst be solely a cultural college, that it put culture first, before practical studies, and before athletics. To accomplish this they asked that the number of students be limited to about five hundred, that the effort to secure larger numbers be declined in favor of the aim to secure the best and more earnest select youth, who should be admitted by a strict examination, and the indifferent ones rejected. They asked that only the best teachers be sought and retained, men competent to teach rather than to seek renown for their original work, and that they be held by such a generous wage that they shall not be drawn off to other institutions. The degree of Bachelor of Science, which definitely discriminates against the classics and appears to be established to help lazy students, when it is not intended to give instruction for a trade or business, they would abolish. They ask thus for a college that should be earnest to do intensive work and such as will train broad men, with a large outlook on life and service for the public.

It is a grand thing for a college when its graduates possess such ideals of education. How would the trustees and the faculty meet such an address, which seemed somewhat to criticise and more to urge and prod them to reach the higher rather than the more immediate aims of education? How did they receive it?

On the whole, well and gratefully. They accepted the true aim of a college to give a broad culture as their purpose, rather than the ability to make a hasty living. They admitted that the giving of the degree of Bachelor of Science had been a mistake and would be given up, because it had come to be associated with the technical and practical courses rather than with culture. They believe in the old classical studies, Latin and Greek, but they found that it is impossible to insist on Greek, so long as the high schools cease to teach it. But they will insist on Latin for admission, the full preparatory course, and not less than two years in college for all students. Latin is compulsory. But if Greek is given up they will require a good reading knowledge to be acquired of both French and German to take its place. They also recognize that in these days for culture a general knowledge of science is absolutely necessary, and not less, or even more, of the social sciences which have to do with government and the problems of city and country life. They also accept gratefully the thought that college teachers are inadequately paid, and they announce that they have, in the direct line of the urgency of the class, this year secured $400,000, whose income will be devoted solely to the increase of salaries, in addition to as much added shortly before. They regret that the study of Greek has lost so much public favor, and they announce that they have secured Sir Gilbert Murray, Regius Professor of Greek in Oxford University, and an unsurpassed scholar and teacher, to come to Amherst next spring for from four to six weeks, not to lecture, but to teach and train the choice Greek students, and that a conference of Greek teachers will be called to meet him while there. The trustees and faculty do not say that they would arbitrarily limit the number of students to about five hundred, but they allow that this number is about as large as can be properly instructed without a considerably increased teaching force. They would have students admitted not wholly on the basis of their immediate preparation at a superior fitting school, but also on their character, purpose and ambition.

This response seems to be about as fair an answer to the address and admonition of the class of 1885 as can be given. It cries halt to the excess of easy or practical electives. It holds up the true aim of the college, which is no trade school, but a school of manhood and wide, sane thought. We would have it read by parents and teachers; and the attention thus called during the year to the true principles of education will be of value to many other institutions besides that in the Hampshire hills of Massachusetts.

## Water

THIS is the season of the year when we appreciate the fact that our bodily substance is mostly composed of water. Lucky for us that it is, for water is not only the most abundant, but the most even tempered of liquids. It is slowest to cool and, what is of more interest just now, it is slowest to heat. We may have to make an exception to that statement in favor of liquid hydrogen, but then liquid hydrogen is altogether unsuitable as a beverage. It is this thermal conservatism of water, otherwise known as its specific heat, that keeps us going regardless of the weather. For we can only live within the narrow range of two degrees Fahrenheit, and it requires a delicate adjustment of the mechanism to maintain that temperature as we roam from the equator to the pole, or as the climates of these regions alternately roam over those of us who live in the north intemperate zone.

It is water that keeps all parts of the body at the same temperature in all weathers by circulation, and then in hot weather like this reduces the temperature by evaporation. So as a man on a pleasure excursion has to put a bill into his pocket from time to time to compensate for the sum imperceptibly evaporated in small change, so we require frequent invoice

of water to keep up with the increasing retail output. The body in summer time is a steam engine, constantly taking advantage of the high rate of exchange between liquid and gas. For water is twice blessed. It gives us a blessing as it comes and as it goes. And the later is the greater, tho we are not so grateful for it. We appreciate the coolness of a glass of ice water, but it does us fifteen times as much good afterward as it escapes thru a million pores. A cup of hot tea, that also may cool us off, for it takes away with it in evaporation from the skin fifty times as much heat as it brought to us.

Water is really what is wanted, altho we add various flavors, call it by various names, and charge various prices for it. And it does not matter much what its initial temperature is, it will serve its purpose just the same. The only important thing is to get enough of it at all times, before meals, after meals, between meals and at meals. One can hardly get too much of it, but one usually gets too little. In the old days, when the principle prevailed that anything you liked was not good for you, it used to be thought unwholesome to drink at meals. In support of this idea the theory was invented that it retarded digestion by diluting the gastric juice. It was a good theory—only it was not so. It occurred to a man in the University of Illinois recently that it might be well to find out if it was true, and he found out, by a series of practical experiments, that the drinking of water at meals promotes digestion instead of checking it.

The regulation of the strength of the various fluids of the body is as nicely adjusted as the equilibrium of temperature. But both are dependent upon an abundant water supply. Taking away the cups from public watering places unless they are replaced by other and free means of drinking is likely to cause more disease than it prevents. An excess can be easily disposed of but a deficiency upsets the machinery. A pound of water a day is about what the body can manufacture in its internal laboratory from the hydrogen of the food and the oxygen of the air, but this is not nearly enough to run it. The automobilist cools down his combustion cylinder by wrapping it with water and keeping this in rapid circulation. We also are propelled by an engine using food as fuel in much the same way and we use the same device to prevent overheating. But we have to evaporate the water to get the full cooling effect and this tends to dry us up, to make mummies of us, to leave us stranded for want of water.

Our thirst is thus the longing of the salt that is left behind for the water that has departed. It is a sort of homesickness, a longing for an ancestral habitat. For Venus Anadyomene is a verified myth. All life sprang from the sea. And the tide that ebbs and flows thru our heart is composed of the same elements as the ocean from which it was originally dipped. If we are wounded and lose blood the surgeon fills our veins with salt solution of the proper strength and thus makes a satisfactory substitute.

So water serves us as a double gyroscope; it maintains the body in thermal and osmotic equilibrium, both necessary for health and life. The adjustment is automatic, fortunately quite beyond our reach so we cannot meddle with it directly. But we can and sometimes do interfere with its work by refusing it the necessary medium. Then the circulation coils become clogged; the vital fluids become thickened. Then comes up a cry for more water which is not a perverted desire. Quite the contrary it is an aspiration for the isotonic norm, akin to the longing of the soul for righteousness, and should not be denied.

## New Fruits and Plants

VERY few of the people of the United States have any means for apprehending the work done by the Department of Agriculture, in the way of introducing new plants and trees and fruits into the United States. The report for a part of 1910 has been published in the form of Bulletin No. 207. It contains considerably over one thousand new plants, many of them of very pronounced importance to horticulture and agriculture. There are over one hundred varieties of alfalfa, brought in from Mongolia, Turkestan, Russia, Mexico and other parts of the world, all varying in their hardiness and productiveness as well as other qualities;

with the promise of giving to our farmers in the far North and to others in the far South forage plants adapted to their specific soils and climates.

The Department has already added greatly to our list of hardy apples, and is now trying to turn over to us something that will furnish high quality fruit in Florida and Texas. Corn has already been developed that can be planted in June or July in the Gulf States, and yield a crop equal to that grown in the Middle West. One of the latest importations from the Caucasus is a very large white apple, often weighing several pounds each; while another variety from the same section is able to stand the high summer temperatures of the lower South. Working with our common stock it would be many years before, by cross breeding, we could widen the apple belt down to the Gulf, as we have already widened it well up into Minnesota. This work was done by a few enthusiastic men, like Gideon.

The persimmon, which in our native stock is rarely of much value, has been brought in from all quarters of the world as a fruit quite as large as a Northern Spy apple, and of delicious quality. So far we have not obtained varieties that will endure the climate as far north as Kentucky, but among the recent importations are those that are probably hardy north of the Ohio River. The plum-apricot, secured in Russia, is a good rival for Mr. Burbank's plum-cot. There are dates that are certainly much hardier than the varieties known to commerce, and some of these are ready for testing in our Southern States. One beautiful palm has been found that will endure a climate where the ground freezes slightly. The list of seedless grapes has been widened lately so as to take in all colors and improved qualities. There is really no reason why grapes should be placed on the market with very large seeds and many of them.

Drought resistant fruits are of immense importance in some of our Southern States where irrigation is not a system, but dependent upon individual enterprise. The Government is making special efforts to fill the need. It has found five varieties of pears in Manchuria, besides clovers and other forage plants that it is testing in the more arid sections of the country. It is notable that a race of olives has been found that will stand a temperature of 2 degrees below zero. This will add an exceedingly valuable fruit to the list now cultivated in California, Texas, Florida and Georgia. The only question that crowds on us as we study these bulletins is whether the Government can secure capable agents among our farmers and country folk to give all these new things adequate tests. The work is enormous, looked at from any point of view, but the promise ahead is immeasurably hopeful.

## Theological Seminaries

By the courtesy of Charles E. Waters, of the Washington Bureau of Education, we received some fuller figures than we have already given as to the increase in the number of theological students in the United States, with some comparison between Protestant and Catholic seminaries.

In the year 1870 the whole number of schools of theology that reported to the Bureau of Education of the United States was 93, viz., 83 Protestant and 10 Catholic schools. The whole number of students reported as enrolled in the 93 seminaries was 3,334, viz., 2,569 in the 83 Protestant and 765 in the 10 Catholic schools. The number of graduates was not reported in the statistics for that year.

In the year 1910 the whole number of schools of theology that reported to the Bureau of Education in the United States was 184, viz., 154 Protestant and 30 Catholic schools. The whole number of students reported as enrolled in the 184 schools was 11,012 (included in which number are 491 women. The number of students (including 491 women) reported as enrolled in the 154 Protestant schools was 8,337, and 2,675 (men) in the 30 Catholic schools. Average number of students per school: Protestant (including women students), 54; excluding women students, 50.9; Catholic, 89 (men). The total number of graduates reported by the 184 divinity schools was 1,759, of which number of graduates the 154 Protestant schools

(including 33 women graduates) furnished 1,410 and the 30 Catholic schools furnished 349 (men). The per cent. of graduates (including women graduates) in the 154 Protestant schools was 16.9, entirely eliminating women students and graduates the per cent. of graduates in the 154 Protestant divinity schools was 17.55, while in the 30 Catholic divinity schools it was 13. But it should be borne in mind that among the graduates of the 154 Protestant schools there are included a number of both men and women who are more particularly graduates in the Bible school (fitted for evangelist and missionary work) rather than graduates in theology. In the 30 Catholic schools it is reasonable to suppose that nearly the entire number of graduates entered the priesthood.

The religious denominations represented in the 184 theological schools reporting to the Bureau of Education in 1910 were as follows: Advent, 1; Baptist, 18; Roman Catholic, 30; Disciples, 17; Church of New Jerusalem, 1; Congregational, 11; Evangelical, 2; Hebrew, 2; Lutheran, 29; Moravian, 1; Methodist, 22; non-sectarian, 12; Presbyterian, 21; Protestant Episcopal, 12; Universalist, 3; Unitarian, 2.

Of course, in these statistics a number of denominations are included under such titles as Lutheran, Presbyterian and Methodist; but it is evident that there is a great waste of effort and expense. Every Catholic bishop does not need a diocesan seminary. There should be scores of Protestant seminaries united or closed up. So many is little less than a scandal. They are beginning to do things better in China.

**The Delay of the Senate**

The extreme heat of July, which Washington feels at its fiercest, is a blessing to the country if it compels the Senate to cut short its unnecessary speeches and come to a vote on reciprocity with Canada. The people have spoken; they want the fence between our people south and our people north of the border lowered, and would be glad to have it removed altogether. We are one people, having the same interests, and to keep us apart is a disservice to both. It is clear by this time that American agriculture has no reason to fear the effect of the measure. Canada is pouring into New England, and the United States is pouring by the tens of thousands into the western Provinces of Canada. On neither side would we make the fellowship of business any more difficult. We believe the two commissions made a fair deal, but even if the Canadians had got a bit more than we, that would be no real reason for objection. Good will is an asset as well as money, and it brings money in the end. The two countries are one in interests. The railroads make us one, and so do the lakes. The sooner the Senate finishes its tedious speeches, and the sooner Mr. La Follette gives us a pause and allows a vote to be taken, the better the country will be pleased.

**The Alaska Coal Lands**

It is a tremendous victory for Mr. Pinchot and ex-President Roosevelt that the General Land Office, after full investigation, has canceled the Cunningham claims to 12,800 acres of coal lands in Alaska. It was because of the contest over these claims that Mr. Glavis was recalled when he had not finished his investigations, and Mr. Pinchot was retired from office, with a rebuke from President Taft, who depended on the judgment of his Secretary of the Interior. Mr. Ballinger had to go, and his support by the President was the chief error of his administration thus far. It is now clear that the claims were really fraudulent, and the purpose of the capitalists and speculators was to gain possession of lands that belonged to the people. They are now retired, under law, and we must await now the much needed action of Congress, so that these coal lands can be opened for mining under proper limited leases. Alaska is suffering for the delay.

**Lynching by Officers of Law**

There is a gradation in the heinousness even of lynchings. Some sins in themselves, and by reason of several aggravations, are more heinous in the sight of God and men than others; and while lynching generally comes among the more heinous sins, the last lynching in Walton County, Ga., is heinous in a special degree. We get the facts from

the Atlanta *Constitution*. When the victim was first put on trial, the Governor was notified that the negro would be lynched if he was not protected by troops; and three companies were sent to see that no violence was done. The trial was put off till June 27, and the negro taken to the Atlanta jail for safe-keeping. It was common rumor, and everybody in Walton County knew, that an attempt would then be made to lynch him, and that an organization had been effected for the purpose. The judge of the court openly declared that without military protection the trial would be prevented. The sheriff knew perfectly well that the law would be defied, and he so told the judge, and yet he refused to write even a line to the Governor asking the protection of the law, having full knowledge that the Governor would honor his requisition. The Governor knew that the prisoner was likely to be lynched if sent without military protection, but he held that he had no authority to send troops without a request from the sheriff. Now let the *Constitution* tell the rest of the story, for we need to add nothing more:

"Notwithstanding this full knowledge of the situation by every official, from the highest to the lowest, charged with the sacred responsibility of maintaining the law, two prisoners presumed to be in the safe-keeping of the State, and solemnly guaranteed a fair trial under its constitution, were *openly, wilfully and deliberately* sent to death at the hands of a mob.

"If officials in Georgia are going into the lynching business, it is time for those who believe in law and order to sit up and take notice!"

**Holding the Hindus at Home**

Canada, Australia, and the rest of the self governing British possessions may be loyal enough, but they are determined to have their own way, whatever may be the wish of the mother country. This appears not only in the present reciprocity negotiations, which are carried on quite irrespective of any preference for British trade, but even more sharply in the discussions in the Conference of the Premiers in London. It is the chief concern of imperial policy to safeguard India preserving that populous and potentially mighty country as a loyal British possession. In London the Indians, Moslem or Hindu, are treated as equals, but the British colonies rigidly exclude them from their shores, a treatment which gives great offense. Accordingly, in the sessions of the Conference Lord Crewe gently suggested to the Premiers a relaxation of the laws of exclusion; but not one of the Premiers would listen to the idea. Their own British people will not submit to it that the immigration of Hindus any more than of Chinese should be free. From all the four dominions of Canada, Australia, South Africa and New Zealand came the same reply, that their economic conditions would not allow it, that is, the labor unions would not permit. Sir Wilfrid Laurier said for Canada that the insistence on the admission of these Eastern people might even strain the loyalty of Canada to Great Britain. He meant that Canada would have her own way, no matter if it meant separation from England. So the connection of India does not concern one of these dominions when their local interests are concerned. They are just as determined that the immigration of Japanese also should be forbidden, no matter what the treaty between Great Britain and Japan. So slender is the cord which binds the self governing colonies to the mother country.

**Vacation Exercise**

It is a matter of importance to most of us to take advantage of our vacation for recuperative purposes. What best to do with ourselves during this period is sometimes a problem. Dr. Gulick, in *Lippincott's Magazine*, undertakes to tell us what we can best do for better circulation, better respiration, better digestion. He likes baseball for its effect on the limbs and back, only it has a sort of one-sidedness. The trained pitcher, however, generally has a good physique and all around strength. A person who is not nervous can safely devote himself to lawn tennis, but the doctor thinks that this game requires too intense attention for some people. Those who are eager for every point are in danger of putting into tennis too much nervous energy. Chasing butterflies and climbing mountains he considers about equally valuable. The main essential is to keep out of doors and satisfy the in

stinct of action. In winter he would advise skating because it involves deep breathing, and the jolts are of a decided advantage to the stomach and bowels. Playing billiards is a fairly good exercise so far as it leads to walking and bending, but it is a very limited field and is all indoors. The doctor has not much to say in favor of Indian clubs, which on the whole he considers of little more value than typewriting—for typewriting really does give a good deal of work for a large number of muscles. The game which he considers pre-eminently well suited for recreation is that of golf. He likes it better for old people than for boys and girls. A man who plays eighteen holes on a golf course has walked two miles and a half and has stooped down a good many times, and done some hill-climbing. The subject is one of much importance, but we are inclined to think that the answer depends largely upon the constitutional temperament. The little old game of quoits has in it most of the elements of good exercise and sweetening the spirits. Croquet has the advantage of bringing all of the family together. What we want is to affect the whole organic life, just as the whole body and mind are affected by hunting and fishing.

**Our Domestic Foes**

It is remarkable how large a share of our modern struggle for existence is a matter between ourselves and the most insignificant things. The fly has become a great competitor of humanity in the possession of the house as well as the stable, and he will down us if we do not completely control his movements. It is not a very pleasant fact to have thrust at us that this insect would scarcely exist on the earth but for our own filthy habits. Keep your stables clean and your kitchen slops utilized and the fly will be out of the question. It is easier to get along with the mosquito, because he does his breeding scientifically, and shifts his garments first in pools and stagnant ponds. A thoro campaign will master him without question. Dust becomes a third of these minute foes, and not a bit to be despised. Its character is best shown in a microscope. It contains about every imaginable poison detrimental and destructive to the human organism. You can scarcely collect a pinch of it on a parlor floor that is not charged with both mineral and animal poison. In our cities the two chief enemies are smoke and noise, not very powerful from one standpoint, but terribly efficient for all that. The two combined make havoc with our nervous systems, and ought to be abated. Millions of dollars annually spent in the battle with minute fungi do not control the invisible germs that destroy our groves and orchards, and reduce our fruit crop by at least one-tenth. So the battle goes on in every direction, and we have no sooner one infinitesimal scale under subjection before another appears. Bacteria is a word that was unknown fifty years ago except in scientific circles; today it means that every schoolboy must learn something very practical about the invisible enemies that he is to contend with or he will be beaten in the life struggle.

**Establishment of a Mission Seminary**

We are pleased to hear at the same time of the establishment by Protestants and Catholics of a special seminary of instruction for candidates for the field of foreign missions. The Catholic archbishops at their late meeting in Washington decided to establish, probably in Washington, a college and seminary for the education and training of priests for missionary work in foreign lands. Hitherto the Church has given all its energy to home extension, but it feels it now time to take its part in foreign missions. There is scarce a foreign missionary from this country now in that great service, which has been left to the French, Belgians and Italians, altho our assumption of the Philippines has compelled the American Church to send its missionaries to those needy Catholic islands. Already for Protestants a separate department of missions has been organized at Hartford Seminary, and Mr. Edward W. Capen, son of the president of the American Board, is at the head of it. It would be difficult to find a man better fitted for the task by his extended visit to the mission fields and his study of the methods and problems involved. The plans had been well developed, and we may expect that to such an

institution will be attracted not a few young men and women who, as ordained missionaries, physicians and teachers, feel called to this work. One advantage that will appear will be the opportunity to test the quality of applicants, and to weed out those whose idiosyncrasies would render them unfitted for this peculiar and difficult service.

M. Ashby Jones, D. D., gave the baccalaureate sermon at the commencement of the University of Georgia. His father was staff chaplain for Stonewall Jackson, and later chaplain of Washington and Lee University, where General Lee spent the last years of his life as its president. A good part of his baccalaureate address was devoted to a plea for intellectual liberty in the South, and he doubtless had in mind such cases as that of the removal of Professor Banks from the University of Florida for an article in THE INDEPENDENT on the semicentennial of secession. The South, he said, must free herself from the slavery of self consciousness, and be ready to allow her people to vote their convictions without fear of social ostracism. Equally the newcomers should feel free to speak and vote as they please, and to differ from the prevailing sentiment as to politics. He concluded with a plea for honesty of purpose in the search for truth and fearlessness in acting accordingly. This represents a new and better spirit, of which we see many indications.

The excitement in St. Louis over the case of Mrs. Collins, who was discovered to have an invisible stain of negro blood and whose husband therefore repudiated her and her infant child, led to very foolish action on the part of half a dozen young men in the Christian Brothers' College, who refused to receive their diplomas if a colored youth was allowed to graduate with them. They had for three years suffered the association and their action was belated. The president was firm, and we are pleased that *The Western Watchman*, the Catholic journal of the Archdiocese, supports him. These youth, when they go to Rome to study for the priesthood, will have black negroes from Dahomey or Zululand in their classes. The Church claims to know no distinction of race.

Doubtless the Poet Laureate has done his duty with the coronation, altho we have not seen his verses; but another poet of a similar name, Austin Dobson, has given us his accustomed ode for the occasion. There are six verses, and the rimes run from one verse into the next. We give the third, which continues the aspiration for a glorious reign:

"That our State 'Dreadnought' once again
May cease in broken seas to veer,
And shape her course direct and plain,
With Thee to steer."

The steersman is George V and not the Divine Being, and none of the verses reach a lyrical quality. Probably the other Austin would do better.

The commission plan of city government has a hard struggle for acceptance in cities in which the bosses have a strong organization. Such is the case in Hoboken, N. J., where last week the business and professional men strongly favored it, but it was defeated overwhelmingly by the votes of the adherents of the two political organizations. The police and the firemen opposed it—and they understand politics—because they feared a commission government might reduce their pay. In New Brunswick, N. J., the commission plan was also rejected by a similar majority.

It is good news that only minor details remain for the final formulation of the general arbitration treaty with Great Britain. The important thing is that the treaty as now being drawn up, after having been submitted to London, includes in the list of arbitral controversies those of vital interest and national honor. The rights of the Senate are preserved by granting to the Senate the right to pass upon the protocol or statement of the questions at issue.

In this country we expect to pay to our gas companies as much as $1 per thousand feet. In Birmingham, England, it can be had for a half that amount; but there the city owns and operates the gas plant, which contributed $368,012 to the reduction of taxation. But Birmingham owns and operates the gas, street railway, electric supply and water services, and they contribute $443,012 to the relief of taxation. Why not here?

# Insurance

## Fire Company's Building

THE Continental Insurance Company, for many years located at 40 Cedar street, New York, will move into a new building on April 1, 1912. The new building, which is to be known as Eighty Maiden Lane, will be one of the largest and finest office buildings in downtown New York. The structure will be erected by the Fire Companies Building Corporation, controlled by the Continental and the Fidelity-Phenix Insurance Companies. The contract has been given to the Thompson-Starrett Company and

THE NEW CONTINENTAL INSURANCE COMPANY BUILDING.
80 Maiden Lane, New York City.

work is already well under way. The cost will be approximately $3,000,000, exclusive of the price of the ground.

The building is to extend from Maiden Lane to Cedar street, and will include the street numbers from 78 to 88 Maiden Lane and from 13 to 27 Cedar street, with a frontage of 143 feet on Maiden Lane and 173 feet on Cedar street. The total area of the plot is 20,500 square feet. The rentable area of the floors will vary from 13,000 feet to over 16,000 feet, according to the subdivisions. This will give Eighty Maiden Lane a rank as one of the largest downtown office buildings in floor area.

The structure will contain 700,000 enameled bricks, and 5,000,000 common bricks. The building will have 32 miles of electric conduits, 10 miles of heating and plumbing pipes, 50,000 square feet of marble floors, 10,000 square feet of marble staircase, 2,000 windows and 75,000 square feet of glass. It will be illuminated by more than 10,000 lights.

Eighty Maiden Lane, which has been designed by D. H. Burnham & Co., architects, of Chicago, will be as architecturally attractive as it is practical to make a modern office building. The base of the building will be of Bedford limestone, and all the exterior walls will be faced with cream colored enameled bricks. The ornamentation will be terra cotta with an enameled surface. A hall will run thru the building from Maiden Lane to Cedar street, connecting the two entrances. There will be six express and six local elevators. The building when completed will be 308 feet in hight, and will contain twenty-four stories. All the foundations go to bed rock, which is between 50 and 60 feet below the street level.

The Continental Insurance Company was founded in 1853. The premiums received since the organization of the company amount to over $142,000,000, and the losses paid to over $75,000,000. The present capital is $2,000,000, and the net surplus $13,646,478, which is the largest of any American fire insurance company. The Fidelity-Phenix Insurance Company, which is a consolidation of the Fidelity Insurance Company and the Phenix Insurance Company of Brooklyn has received in premiums $187,000,000, and paid in losses $94,000,000. The present capital is $2,500,000 and the net surplus $3,385,745. Henry Evans is president of both companies.

From England comes a report of curious claims put in for accidents. We select a few from the list:

Cow, whisking her tail, causes injury to milkmaid's eye.

Bell-ringer ruptured during ringing of wedding bells.

Barmaid severely hit by flying cork.

Nurse's finger bitten by toy dog.

Agricultural laborer stung by a bee.

Man-servant sprained leg thru stamping on rat.

Domestic, fetching coal out of cellar, collapsed from fear caused by silent appearance of washerwoman and broke her arm.

Parlormaid, walking across lawn to fetch in garden chair, slipped and sprained her back.

Coachman, proceeding from stable, struck on face by master's slipper, intended for a singing cat.

Cook, breaking coal, piece went down her throat.

The New York Life Insurance Company will hereafter limit the acceptance of new insurance on an individual life to a maximum of $100,000 within any twelve months period, with smaller limits for impaired risks, female risks, hazardous occupations, and risks on ages over fifty-five. These limitations have been in force to a certain extent before, but from now on will be strictly followed without exception.

After considerable litigation and discussion the Metropolitan Life Insurance Company has finally been granted permission to construct a tuberculosis sanitarium in Saratoga County, N. Y. This worthy object should have been approved by the State authorities long ago, and it does not reflect credit on them that they should have blocked so beneficial a plan.

The Rochester Chamber of Commerce calls attention to the fact that "all fires are the same size at the start." The great Chicago fire was started by a cow kicking over a lamp.

According to the State Fire Marshal there were 2,094 fires in Connecticut last year. Of this total 69 were alleged to be of incendiary origin.

# Financial

## Bank Safeguards Attacked

The present Legislature of New York has not made a good record, and among its shortcomings are bills, passed or favorably considered, weakening the safeguards of banking. With the help of Governor Dix a law has been enacted which reduces the required cash reserve of State banks by virtually allowing them to substitute bonds for a part of it. There is now pending a more pernicious proposition. These bad banking bills are the work of a Tammany Senator, Thomas F. Grady, the least worthy of all the Legislature's members. The bill now under consideration practically forbids State banks and trust companies to enter the New York City Clearing House Association. There has recently been a movement for the admission of trust companies to the association, and seventeen of them, with $420,000,000 of deposits, have become members. Among the older members are sixteen State banks, whose deposits amount to $240,000,000. The requirements of the association concerning cash reserve are more severe than those of the State law, but they are not excessive, and the admitted State banks and trust companies have willingly conformed to them. Grady's latest bill forbids any State bank or trust company to be a member of any association whose reserve requirements are greater than those of the State law. The quality of this unworthy legislator is indicated by his remark that the Clearing House Association is "a gang of highwaymen." The State institutions which are in the association have adopted resolutions declaring that the only purpose of the reserve requirements is to safeguard deposits and promote conservative banking. And this, of course, is true.

The grand record of the New York Clearing House Association as a safety agency in time of peril is known to all intelligent and fair-minded Americans. Admission of the trust companies was to be desired, in the interest of the depositing public and for the strengthening of the entire banking fabric. Our latest panic showed the need of the reserve conditions which the association imposes. The influence of all who desire ample protection for depositors should be exerted to prevent the enactment of this Grady bill.

## Reichmann Found Guilty

Joseph B. Reichmann, formerly president of the Carnegie Trust Company, was found guilty in this city, last week, of making a fraudulent report to the State's Banking Department, and was sentenced to be imprisoned four and one-half months in the penitentiary. The investigation showed that the conduct of the trust company, under Reichmann's direction, was characterized by many kinds of objectionable banking. All who desire that the banking institutions of New York shall be clean should rejoice over this enforcement of a good law.

....The Government closed the fiscal year with a surplus of $28,000,000.

....More than half of the 625,000 miles of steam railroad in the world are in North America.

....It is expected that the Canadian Pacific will acquire a controlling interest in the Erie road.

....Increase in the number of orders from many sources has caused improvement in the steel business.

....Dividend and interest disbursements this month, as compiled by the *Journal of Commerce*, are $233,739,730, against $212,871,833 a year ago.

....The National City Bank has decided to form a subsidiary security company with a capital of $10,000,000, which will be supplied by a cash dividend of 40 per cent. on the bank's stock.

....In 1910 we imported 264,000,000 pounds of wool and produced 321,000,000 at home. In the last ten years imports were 1,932,000,000 pounds, valued at $324,000,000, and the home product was 3,051,000,000 pounds, worth $607,000,000.

# The Independent

VOL. LXXI NEW YORK, THURSDAY, JULY 13, 1911 No. 3267

## Survey of the World

**Reciprocity in the Senate**

It is now expected that a final vote on the Canadian reciprocity agreement will be reached in the Senate before August 15, and that the bill (as it came from the House) will be passed without amendment. On the 8th there was a significant test. By a vote of 32 to 14 the Senate rejected Mr. Cummins's amendment putting meat and meat products on the free list, and unanimous consent was obtained for a vote on the 10th upon his other amendments. In this test, 20 Democrats and 12 Republicans were counted in the negative. Voting for the amendment were Messrs. Bailey, Simmons and Thornton (Democrats opposed to reciprocity); Sutherland and Clark, regular Republicans; and nine insurgents. The most important amendments to be acted upon after the 10th are those of Mr. Bristow, relating to sugar, and an extensive program of revision proposed by Mr. La Follette, in support of which he will speak for three or four days. It is plain that all will be rejected by a vote of about 2 to 1. The Senate will meet hereafter at 11 a. m., instead of at noon, and some time will thus be gained. Mr. Penrose told the President last week that adjournment might be reached by August 1, and that the reciprocity bill was safe. So confident of its passage are the Treasury officers that they are beginning to work upon the new regulations which reciprocity will require.——In last week's debate Mr. Cummins finished his long speech. Mr. Burton, defending the agreement, reminded Mr. Cummins that in 1904, in a public address, he had advocated reciprocity with Canada and had said that the farmers of Iowa would suffer no more from the free admission of Canadian products than from the competition of adjoining States. He also showed that, in the tariff debate of 1909, Mr. Nelson (now opposing reciprocity because of the proposed free admission of grain) had said:

"The protective duty on wheat up to this time has been of no earthly value to the wheat farmer. As long as we export wheat, the price is fixed by the Liverpool price."

He also pointed out that in the same debate Mr. La Follette had said:

'The only benefit the agriculturist receives from the tariff is in the duty on wool and the duty on barley, except an indirect benefit gained by feeding the people employed in protected manufactures."

Mr. Burton's own opinion was as follows:

"The substantial advantage to the farmers of the United States from the tariff has not been derived from duties imposed directly upon their products, but rather from the growth of an enormous industrial population and the multitude of professional and other classes dependent upon the industrial population."

Mr. Gronna, like Mr. Cummins, held that the President had exceeded his constitutional powers in negotiating the agreement.——Speaking in Indianapolis on the 4th, President Taft defended the agreement, answering the arguments of those who assert that it is not in accord with sound Republican doctrine. Said he:

"The Republican party in its last national platform declared in favor of tariff duties which would measure only the difference in the cost of production of articles here and of articles abroad. In other words, the sound Republican doctrine has become the imposition of duties only where the conditions are naturally unequal and where duties are necessary in order to enable our manufacturers and other producers to meet on a level the

competition of foreign producers. The Canadian reciprocity agreement which has been made squares exactly with this doctrine."

He pointed to the acts and utterances of Mr. Blaine and President McKinley in favor of reciprocity. The pending agreement, he said, would not reduce the cost of living greatly, if at all, but it would steady prices and make it more difficult to corner food.——The Democratic bill for a revision of the cotton goods schedule is not yet ready for caucus action. It is said that it reduces duties by about one-half. Senator Bristow says he will never consent to adjournment until the duties on cotton goods, woolen goods, steel, sugar, lead, rubber and all Trust-controlled products have been reduced.

**Arbitration Agreements**

Secretary Knox and Ambassador Bryce signed, on the 6th, the schedules relating to certain pecuniary claims, some of them quite old, and to the terms on which they are to be submitted to arbitration, in accordance with a special agreement. This will be the second resort to arbitration under the treaty of 1906. The first related to the fisheries dispute. The Secretary and the British Ambassador also conferred with respect to the phraseology of the proposed new and broad treaty of arbitration, which is so nearly completed that the President is confident he will be able to lay it before the Senate before the end of the present session of Congress. In the House of Commons on the same day the British Secretary of Foreign Affairs said there was every prospect that the treaty would soon be signed. "I believe," said he, "that the United States Government and ourselves are now in substantial agreement as regards the details."——Addressing the Christian Endeavor convention at Atlantic City on the 7th, President Taft referred as follows to the negotiations:

"I am glad to say that today we have reached such a point in the negotiations for a treaty of universal arbitration with one of the great European powers that we can confidently predict the signing of a satisfactory treaty. The arbitration treaty heretofore with Great Britain and other countries has excepted from the causes which may be arbitrated those which involved the vital interests of either party or its honor. The treaty which we are now closing with Great Britain eliminates these exceptions and provides that all questions of international concern of a justiciable character shall be submitted to the arbitration of an impartial tribunal. I am exceedingly hopeful that other countries besides Great Britain will accept the form of the treaty, or one like it, and that we may have half a dozen of the treaties with the European countries looking toward arbitration of international differences. This will not abolish war, but it will provide a most effective and forcible instrument for avoiding it in many cases."

He explained that the agreement, instead of making arbitration necessary, interposed mediation for a year, with the possibility of adjusting the differences in that way, without a resort to judicial action. Speaking at Marion, Ind., on the 3rd, he answered the recently published argument of Mr. Roosevelt against any treaty requiring arbitration for questions of national honor.——At Washington, on the 7th, as the result of the labors of the International Seal Conference, representatives of Great Britain, Russia, Japan and the United States signed a treaty which prohibits pelagic sealing in the North Pacific and in the Seas of Bering, Okhotsk, Kamchatka and Japan for fifteen years. It also forbids the hunting of sea otters on the high seas, and provides for the maintenance of a patrol.

**Washington Notes**

Senator Newlands introduced, last week, a bill creating an Interstate Trade Commission, of five members, for the control of industrial corporations or Trusts. It relates only to corporations whose annual receipts exceed $5,000,000. These would be required to make frequent statements as to capitalization and operation, and to be registered. The commission would not be empowered to fix prices, but would be authorized to cancel registration as a punishment for improper financial organization, unfair methods of competition, the acceptance of freight rebates and certain other offenses, and also to restrain the offending corporation from engaging in interstate trade. It is said that this bill is regarded with favor by some persons connected with the Administration, and that it represents the views of a number of legislators who are convinced that eventually there must be such a commission.——The Interstate Com-

merce Commission, on the 1st, ordered, on its own motion, a sweeping investigation of all the express companies, their rates, practices, revenues, etc. On the preceding day nearly all the companies had filed schedules of reduced rates.——A House committee is making inquiry concerning the withdrawal from a forest reserve, in July, 1910, by President Taft, of 12,800 acres of public land, largely waterfront, on Controller Bay, Alaska, and the subsequent acquisition of a considerable part of the land by entries filed by R. S. Ryan, said to be an agent of the Guggenheim Syndicate. The land in question is the only property available for the harbor terminus of a railroad giving access to the great coal fields. Ryan says his action had no relation to the Guggenheim syndicate. An attempt has been made to connect Charles P. Taft and ex-Secretary Ballinger with the transaction. At the White House it is said that Charles P. Taft had no knowledge of it, and ex-Secretary Ballinger remarks that the order opening the land for entry was issued upon the recommendation of Mr. Pinchot's Forestry Bureau.

**The Condition of Cuba**

There is unrest in Cuba, and it was reported last week that an uprising against the Government was at hand. Newspapers representing the Opposition say that a revolt is impending. The disturbance is due in part to lack of confidence in President Gomez. A Representative in Congress recently introduced a resolution providing for an investigation by Congress and the Supreme Court as to the manner in which the President had acquired a large fortune since taking office. This was suggested by the President's payment of $135,000 for a site on which, it was announced, he was about to erect a costly mansion. It was recalled that just before he became President he had asserted in court that he had no assets except $89,000 of debts. The resolution of inquiry caused the President to publish last week an inventory of his possessions, indicating that he had only a very small fortune. Owing to reports of disaffection in the Rural Guard, he called out the Havana garrison at midnight on the 7th and stationed these soldiers around his palace for a time. Then they returned to their quarters.——Brigadier General Bixby, Chief of Engineers in our Army, who is in Havana, says that the wrecking of the "Maine" was caused directly by the explosion of her magazines, and that it never can be ascertained whether this explosion was due to an external torpedo or mine.——A joint note has been sent to Hayti by the Governments of the United States, Great Britain, Germany, France and Italy, asking for an adjustment of the long pending claims of their citizens within three months, or the submission of these claims to arbitration.——In the northern part of Hayti, revolutionists have taken possession of several cities.

**Castro on the Venezuelan Border**

Cipriano Castro, formerly President of Venezuela, landed in disguise on the 5th at Castilletas, on the Goajiri peninsula in Colombia, about twenty miles from the Venezuelan boundary, having eluded all the detectives and patrolling ships that had been in search of him since he left his home in the Canary Islands. It is said that he came to Castilletas from Colon. On the 8th it was reported that he had already assembled more than 1,000 soldiers, giving them arms which had been brought from Cuba. President Gomez sent troops in the direction of Castro's camp and caused the arrest of several prominent Venezuelans, one of these being General Jorge Pello. Dispatches from Caracas say that Castro has $7,000,000 in a bank at Paris and is supported by moneyed men in Europe. These dispatches also express the opinion that he will overthrow the Gomez Government. Prominent officials say privately, it is added, that his restoration to power can be prevented only by foreign intervention.——Venezuela's celebration of the centennial of her independence ended on the 6th with a banquet and ball at the palace. The Bolivar Memorial Congress has been in session at Caracas, with delegates representing Peru, Bolivia, Ecuador, Colombia and Venezuela. Their object is to make a closer political union.——Venezuela's Congress has approved the great fifty-year concession to a river and coast navigation company. It grants exclusive

rights on all lakes and rivers, together with the exploitation and colonization of the Amazon territory.——In January last, Colonel Jara, then Minister of War, drove President Gondra, of Paraguay, from office and became ruler of the country. On the 5th inst. he proclaimed a dictatorship, suppressed four or five newspapers and caused the arrest of several members of Congress. On the 6th the garrison at the capital revolted and placed him in prison. Whereupon he resigned and Congress elected Liberato Rojas, President of the Senate, to serve as President, pending a national election.——In Salvador, Dr. Dardano, an associate of ex-President Alfaro, has been arrested for being concerned in a revolutionary plot. Arms, ammunition and bombs were found in his home. He confesses that he at first intended to use them against the Government of President Araujo, but says he abandoned the project some time ago, seeing that it could not be successful.——It is said at Washington that the treaty concerning the loan to Honduras is dead for the present session, altho the President has sent to the Senate a special message earnestly recommending that it be ratified. He does not oppose discussion of the question in open Senate, and would be glad to see both the treaty and the loan contract with the Morgan syndicate made public.

**Labor Revolts in Mexico**

Madero asks the Governors of the Mexican States to co-operate with the central Government in a comprehensive project for irrigation, in order that large tracts of waste land may be reclaimed. He would have those confined in jails and penitentiaries employed, at low wages, in constructing the needed dams and canals, and he desires that the work shall be undertaken without delay. It is understood that he intends to negotiate two loans abroad, one to pay the war debt and the other for railroad construction. An order on the Treasury has been issued for the payment of $320,000 to his brother Gustavo, to reimburse him for money spent in support of the revolution. There is to be an inquiry as to the charge of Emarito Garcia that Joaquin Casasus was sent to Washington as a special ambassador by Limantour, Creel and others, to ask for military intervention. Casasus, who is not in Mexico, may be tried for treason.——There was but little disorder last week. In Michoacan, two bodies of Maderist soldiers quarreled and eight men were killed. In Torreon, Federal soldiers killed a captain and were helped by Maderists to escape to the hills. Federal troops were sent to subdue 200 Magonists who were looting ranches in Coahuila.——The revolution has been followed by many labor strikes, workingmen (who were in sympathy with the revolt) being disappointed because the fall of Diaz did not increase their wages. On the 2d, in the mining district of Mapimi, 45 miles northwest of Torreon, 11,000 men went on strike for an increase ranging from 30 to 100 per cent. On the following day the street railways of the capital were tied up by a strike, the men asking for an addition of 25 to 150 per cent. There was much disorder. On the 6th, in suppressing a strike riot, the police killed six men. A car was smashed in which the Governor of the district was riding. On the 7th, the men went back to work, accepting an offered increase of 3 cents an hour. Strikes in many parts of the country were reported. At Vera Cruz the stevedores quit work. A strike of employees of the National Railways was expected. The natives object to the employment of American conductors and engineers, and in a convention they have protested against the use of the English language in train orders.

**The Veto Bill**

The bill limiting the powers of the Upper House of Parliament has passed thru the committee stage in the House of Lords and will be voted on July 13. A large number of amendments were proposed, but only a few were adopted, and probably none of these will be accepted by the Government. The most important amendments were those of Lord Lansdowne, providing for a special referendum before the King can be asked to assent to any bill

"(*a*) which affects the existence of the Crown or the Protestant succession thereto, or

"(*b*) which establishes a national Parliament or a national Council in Ireland, Scot-

land, Wales, or England with legislative powers therein; or

"(*c*) which has been referred to the Joint Committee and which in their opinion raises an issue of great gravity upon which the judgment of the country has not been sufficiently ascertained."

This, it was argued by the Opposition, was the bare minimum required to maintain a two-chamber constitution, and without such safeguards, the Crown, the Church and the liberty of every institution of the country would be at the mercy of a temporary majority of the House of Commons, which might be representative of a minority of the electors. Lord Morley replied that the Government could not possibly accept the amendments and declared that the question of home rule was plainly put before the people in the last election and received their approval. Two of the Liberal members, Lords Weardale and Courtney, spoke in favor of the referendum. The Lansdowne amendments were passed in committee of the whole by 253 to 46. It is noteworthy that even when a question involving their prerogatives was being considered, fewer than half of the Lords were in attendance. The bill as passed by the Lower House requires the House of Lords to pass any money bill without amendment within a month after receiving it, and makes the Speaker of the House of Commons sole judge of what bills are money bills. This was amended to leave the decision as to the character of the bills to a joint committee of six. This also the Government refused to accept. An amendment proposed by Lord Newton, providing that no bill for the further limitation of the legislative powers of the House of Lords shall be introduced until after another general election, met with a more favorable reception from the Government, and may possibly serve as a basis of compromise. It is freely acknowledged by the Unionists that they have no chance now in an election, and they have no wish to force the Government to the extremity of creating 500 Liberal peers.

*King George in Ireland*

The first visit made by the newly crowned King in his progress through his kingdom was to Ireland. The royal family in the yacht "Victoria and Albert" entered Kingstown harbor July 7 and proceeded on the following day to Dublin. The Nationalists tried to prevent the King's receiving either an official or a popular welcome but were successful only as regards the former. The Corporation of Dublin refused to pass a resolution of welcome or to permit the Lord Mayor to meet the King officially and present the keys of the city. Lord Mayor Farrel declared that he would nevertheless go personally to greet the King and to thank him for omitting from his coronation oath the offensive repudiation of the Roman Catholic faith. Thereupon the Corporation telegraphed to the King not to receive him and ordered the City treasurer to lock up the insignia of office. As a further precaution the official stand on the bridge at the entrance to the city where the Mayor would have delivered the address and presented the keys was daubed with fresh paint. To avoid disturbances Mr. Farrel did not attempt an official greeting but met the King informally on his visit to the College of Science. The streets were beautifully decorated with garlands and bunting but on nationalist houses only Irish and American flags were to be seen. The municipal buildings of Dublin were bare and the Pembroke Town Hall bore merely the inscription "Welcome, We Want Home Rule." The Sinn Fein Society got up an excursion to the tomb of the Irish revolutionist, Wolfe Tone, and sandwich men paraded the streets bearing placards calling upon the people to go there to attend a meeting of protest instead of remaining in town to greet the King. Nevertheless the streets were sufficiently crowded and the crowds sufficiently enthusiastic whenever the royal party appeared.

*Other English Affairs*

The shipping strike was virtually settled on July 4 in a victory for the men. The shipowners agreed to a recognition of the union and a general advance of ten shillings a month to the seamen and a cent an hour more to the dockers with a half holiday for all. The terms apply to non-union as well as union men. Any dispute as to the meaning of the terms is to be settled by the Board of Trade. Most of the men went

back to work and made a speedy clearance of the vessels that had been held up. But at Manchester 12,000 carters are still out, and the attempts to move the cargoes from the docks resulted in serious riots. Crowds of men and women attacked the wagons and threw the produce into the street. The police who were trying to protect the traffic were in many cases injured by the bricks, stones and iron ware thrown by the mob. Reinforcements of police to the number of 300 have been sent from London and a squadron of cavalry and a company of infantry have been ordered ready to assist in restoring order.——The Post Office Department is to take over at the end of the year the business of the National Telephone Company, which comprises 18,000 employees and 500,000 instruments. The property will be acquired by the Government on what is called in this country a "physical valuation," the plant, lands and buildings being bought at prices fixt by the Railway and Canal Commissioners but no payment made for franchises or good will. The present staff of employees, high and low, will be taken over without civil service examination and those entitled to pensions placed on the pension list of the post office. When the question of the purchase came up in Parliament the opponents of the project raised the objection that State management would check progress and invention and raise the cost of the service. They called attention to the fact that the telephone system of England had been developed thru private initiative, and in spite of the impediments thrown in its way by the local and national authorities, and contrasted the popular and efficient telephone system of the United States with the poor Government service of France. In reply the Postmaster-General, Herbert Samuel, stated that the telephone department would not be brought under the routine and regulations of the post office and that the efforts of the Government would be directed to the equalization of rates and the extension of the system, for which purpose a sum of $30,000,000 is to be devoted.——In discussing the discussions of the Imperial Conference we said that the relation between Great Britain and her self-governing colonies seemed to be regarded by the latter more as an alliance than a closer unity. The following quotation from the *Melbourne Age* is a plain spoken statement of this position:

> The ostentatious confidence trick by which Mr. Asquith is supposed to have told the delegates some of the secrets of the Admiralty and the War Office is one symptom amongst many of the desire of the Imperial statesmen to commit the Dominions to Imperial control in war. But Australia has too high a sense of her own dignity and autonomous rights to be taken by such a bait. As an integral part of the Empire Australia stands to the Empire as a partner in peace and war, pledged to take whatever part may seem most effective for the general safety without in the smallest degree pledging herself to hand over her soldiers and sailors to British commanders. We occupy the same position as nations in an offensive and defensive alliance to one another. The foe of one is the foe of both. Both parties concert for the common good, but neither denudes itself of all authority in deference to the other.

**Aviation**

The air race around the circuit of the capitals of France, Belgium and England was won by the French lieutenant, Conneau. His total time for the course of nearly a thousand miles is 58 hours 38 minutes. Garros finished second with 62 hours 17 minutes. Pierre Védrines, who was the only aviator to reach the goal in the Paris-Madrid race a few weeks ago and who was the first to cross the channel going and coming in the present race, met with an accident at Amiens and so came in fourth. Altogether eight completed the circuit, six monoplanes and two biplanes. One of the latter carried a mechanician besides the pilot. At Calais crowds sat up all night to see the first arrivals, but on the English side there were only five or six persons out. ——At the Mourmelon field Loridan broke the European record for altitude by attaining a hight of 10,659 feet. He came down in 12 minutes. In California Hoxey, just before his fatal accident, reached an altitude of over 11,000 feet.

**The Moroccan Imbroglio**

The German gunboat "Panther," which was sent to Agadir, has been replaced by a larger vessel, the cruiser "Berlin," of 3,250 tons and a speed of 23

knots an hour. The French press takes the situation calmly. The German press reiterates that the placing of a vessel at that port does not indicate any hostile intentions, but is merely a diplomatic move to urge France to declare her intentions. The English press asserts that Germany cannot be permitted to acquire a strategic position like Agadir, which commands the transatlantic trade routes. Premier Asquith replied to a question on the subject in the House of Commons in the following words:

"Recent events have been the subject of discussion by the Powers most interested in Morocco. I can say little at this stage, but wish it to be clearly understood that the Government considers that a new situation has arisen in Morocco in which it is possible that future developments may affect British interests more directly than has hitherto been the case.

"We are confident that the diplomatic discussion will find a solution, and in the part which we will take in it we shall have due regard for the protection of those interests and the fulfilment of our treaty obligations to France."

Germany has proposed that the question be made the subject of discussion by pourparlers between the Powers most concerned, France, Great Britain, Germany, Spain and Russia. This is generally regarded as preferable to the calling of another formal conference like that of Algeciras in 1906. The European papers assume that the United States is vitally interested, but it is doubtful if our Government will take that view of it. The act of Algeciras was signed by our representatives Mr. White and Mr. Gummere, with the exprest stipulation that it did not involve our participation in its enforcement or in the political questions involved. But in case there is any truth in the rumor that Germany is to be bought off by being permitted to encroach on Liberia the United States would doubtless have something to say about it. The conference of Algeciras stipulated only for equal commercial facilities and fair treatment of the Jews. Other African questions, such as the Kongo and Kamerun boundaries and the projection of railroads, will be taken up in the pourparlers. The Spaniards at Alkazar (El Ksar) have seized the barracks and military stores and disarmed the Sultan's troops. Premier Canalejas declares that the action of Spain will be confined to the policing of Alkazar and Larache. The Algeciras conference empowered Spain to police these cities, but the French papers point out that this does not involve their military occupation, and that there was no disturbance sufficiently serious to excuse such action. The movement of Spanish troops further up the left bank of the Muluya River is viewed with apprehension by the French, who occupy the right or eastern bank, as the Spanish are known to be ambitious of reaching Taza and constructing a railroad from there to Melilla on the coast.

**Montenegro Mobilizes**

King Nicholas has ordered the mobilization of thirteen infantry battalions, three mountain batteries and three divisions of field artillery, amounting altogether to 7,000 men, to assemble about Podgoritza to protect the frontier passes in case of an invasion by the Turkish troops in pursuit of Albanian insurgents. This is regarded by Turkey as an unfriendly act and calculated to encourage the rebellion. The King of Montenegro would hardly have taken such action without consultation with his son-in-law, the King of Italy, and the sympathies of Russia and of Austria are also with the insurgents. The Porte has issued a circular note to the Powers declaring that under no circumstances would Turkey submit to intervention in its internal affairs by foreign Powers. The accusations made against the Turkish troops of wanton destruction of property and the slaughter of non-combatants are denied, and the Turkish reply charges the insurgents with the burning of churches and depredations on private residents in order to throw discredit upon the Ottoman Government. As for the alleged murders of women and children, the Turkish note states that the Albanians sent their families across the frontier into Montenegro for protection at the outbreak of hostilities. The Turkish Government claims that the arms and ammunition found upon the dead and wounded insurgents were stamped with the royal cipher of Montenegro, and that it very often happened that the Montenegrins outnumbered the Malissoris.

KING GEORGE AND QUEEN MARY CONVEYED IN THE CARRIAGE OF STATE FROM BUCKINGHAM PALACE TO WESTMINSTER ABBEY

THE CORONATION SERVICE IN WESTMINSTER ABBEY, JUNE 22, 1911

# The Coronation of George V.

BY SYDNEY BROOKS

A GRAY, windy day and none the less British for being so; all London pouring Abbey-wards; the cars in the underground trains splashed with the unwonted blaze of admirals', generals' and privy councillors' uniforms; hordes of sightseers with luncheon bags and baskets; much tripping over swords and earnest gazing at gold braid and scarlet tunics and silk knee breeches, amid a torrent of festive inconsequential talk, as the train speeds on; the whole of Victoria street one solid mass of motors, peers' coaches, taxicabs and broughams, each with its vision of nodding plumes and gleaming jewels and resplendent masculinity within; the Abbey, as one draws near it, grayer, more venerable and reposeful than one has ever known it, the fit hearthstone for a worldwide race; a glimpse of stands and tiers multitudinously crowded, of garlands, poles, bunting and glittering emblems, of windows and roofs alive with faces; then the turning into Dean's Yard, usually the quietest of all the little havens in which London abounds, but now bustling and brilliant with troops and guests and officials, women in court dresses with gorgeous trains carried over the arms, naval and military men, judges and officers of the court, and so into the cloisters, till I am directed for the entrance I want and mount up and up and round and round the seven-hundred-year-old corkscrewy stone staircase, till I am drawn thru an arch by a courteous and bespangled usher, and find myself in the South Triforium, 60 feet or so above the nave.

It is 8 o'clock. The royal guests are not due to leave Buckingham Palace till 9.30, and the King and Queen will not reach the Abbey before 11; so there is plenty of time to look around. The Triforium itself is mainly given up to journalists, but among them are not a few army and navy officers and their wives, for whom seats could not be found elsewhere, and also a gathering of white-robed scholars from Westminster School come to assert their historic privilege of acclaiming the King. One wanders about, sampling one coign of vantage after another, and finding each different and each superb. The arch nearest to the western door by which the royal guests, the Princes and Princesses of the Blood Royal and their Majesties, are to enter later on, and thru which already is pouring a stream of peers and peeresses, offers perhaps the best view of all. Craning over its edge and looking down on the floor below and up the whole length of the Abbey, what does one see? What will be the sight that will greet the King and Queen on their entrance? First, a rich blue Worcester carpet stretching along the vista to the carven hight of the choir screen, on which are massed the orchestra and trumpeters round the scarlet, conspicuous robes of Sir Frederick Bridge, the conductor. On either side of the carpet runs a wide border of softer, blue-gray up to the edge of the partitions, three feet or so in hight, that wall off the seats from the Abbey floor. The partitions are hung with silver brocade heavily stamped with patterns in royal blue. Behind them, row upon row, tier upon tier, ascend the seats, their straight lines of pale blue merging exquisitely with the somber gray of the walls and arches. Even at this early hour they are well filled, and every moment sees a new arrival. One looks down on a rippling sea of color. Admirals in gold and blue coats over white breeches and stockings; army officers in scarlet and gold; Scottish chieftains in flowing dark green tartans; the mayors of the great cities in scarlet cloaks edged with minever and hung with gold badges; here a jumble of shimmering hues, a great glittering splash, that resolves itself under opera glasses into Oriental potentates, with flashing turbans and ropes of jewels; there the Earl Marshal's officers showing people to their places, with crimson, gold-tipped staves; and mingling with all the white plumes of the women and their dresses of white or

softest blue or heliotrope or pink or lightest green. Medals and ribbons and orders and clasps and jewels twinkle up at one; only the yellow-gray pillars of the Abbey and the busbied Grenadiers, who alternate with the Yeomen of the Guard, seem motionless; all else goes billowing and sparkling in long harmonies of shade and light.

No stage effect ever began to compare with this. Eyes and brain ache with the ever-moving gorgeousness of it all. Stroke follows upon stroke, gem is added to gem. One watches a peeress, coronet in hand, moving with resplendent grace up the nave and thru the arch of the choir screen, her crimson fan-shaped train edged with ermine spreading luxuriously behind her or borne by a page all exquisite in cream and gold and ruffles and long sword; or a prelate in scarlet and lawn; or an Indian visitor, a walking column of jewels; or an ambassador ablaze with stars; or a judge in full glory of wig and scarlet mantle; or a knight in the brilliant cloak of his order. And they enter not in twos or threes, but in dozens, till for sheer relief one is forced to rest one's eyes on the arching roof of the Abbey and its cool and tranquil vistas. The more distinguished among them and those higher in rank pass, as I said, under the arch of the choir screen that spans the nave, beneath the orchestra and the royal trumpeters, who are to sound the fanfares on silver trumpets, and who stand out gorgeously in their murrey and gold. The screen makes an excellent break as one's eye sweeps up the length of the Abbey, but those who are to the westward of it —perhaps half the total number present —find that it blocks their view of the Coronation ceremonies, and except the entrance of the guests and the processions, they can see little or nothing of all that makes up the splendor of the occasion. But being in the Triforium, with a liberty of movement, I can pass to a point beyond the choir screen, to the very angle indeed of the nave and transepts, and look down on the altar, the thrones, the coronation chair, the very scene of the King's sacring. Just beyond the screen are the choir stalls, soon to be occupied by the royal guests and representatives and their suites. Above them are tiers upon tiers of seats. Then come the transepts, the north being occupied by the peeresses and the south by the peers, and above them both run vast galleries up to the level of the Triforium itself for members of Parliament and their wives. Beyond the transepts one's eye travels over galleries splashed with the red of judges, the blue and white of admirals, the scarlet and gold of army officers, interspersed with the gleam of women's necks and arms, the shimmer of their dresses and the flash of jewels—past the royal boxes reserved for the King's and Queen's and for Queen Alexandra's private friends—till it rests on the glittering cream and gold of the altar, laden with the sacred vessels. In the space between the two transepts, called the "theater," stand the two thrones, in crimson damask, facing the altar and set on a dais, the King's being to the right, the Queen's to the left and lower down. A few yards further on, still facing the altar, is the historic chair of St. Edward, the coronation seat of centuries of English kings. To the right of it, but some little distance, almost, indeed, under the shadow of an arch, stand two recognition chairs, facing northwards, with faldstools in soft light blue before them Down from the altar, over the blue carpet, ripples the sheen of magnificent Persian rugs.

One has not time to take in even one-half the "values" of the general setting before the preliminaries begin. From St. Edward's Chapel, behind the sanctuary screen, the regalia are brought forth, are laid on the altar, are dedicated. A procession forms, headed by the trumpeters, followed by the choir, the sub-dean of Westminster and the prebendaries in their crimson robes. Out bursts the splendid hymn, "O God, Our Help in Ages Past," and with slow ecclesiastical pomp the regalia are borne down the nave and into the tapestried annex, there to await the coming of the King and Queen. Hardly are they deposited before the royal guests arrive. To name them would be simply to give a list of all the reigning families and of all the nations on earth. Nothing that has gone before equals the splendor of their approach, as headed by the German Crown Prince and Princess, they sweep up the

nave in a profusion of varied magnificence, a flowing opalescent stream of dancing light, and take their places in the choir stalls. No sooner are they seated than to the blare of silver trumpets and preceded by pursuivants in medieval bravery, the Prince of Wales enters, a wholesome, unaffected boyish figure, in the mantle of the Garter, bearing a vast plumed hat. He is escorted to a seat in the south transept just in front of the peers' benches. All who are bound for the royal boxes pass before him, and all, as they pass, curtsey or bow, and the Prince acknowledges their salutation with a pleasing, because natural, jerk of his head and shoulders. He is kept for a while quite busy. His three brothers and his sister, and after them a long train of princes and princesses of the blood royal, each with an attendant page or officer or lady in waiting, make their obeisance on their way to the royal boxes. It is the last of the preliminaries before the arrival of the King and Queen. Every seat is taken; the whole massed effect of stateliness and brilliance is at its highest point; all Europe, America, Africa and the Orient, four hundred millions of British subjects, and the best of English beauty, valor and worth, are represented there in those radiant seven thousand personages, awaiting the coming of the King and Queen.

They come at last. One hears the booming of the guns, the faint echo of cheering without. There is not today the feeling of anxious tension that there was nine years ago when no one knew whether King Edward could stand the strain of the long and arduous ceremony. But there is a universal emotion of expectancy fed by all that has gone before and charged with the sense of the full significance of an occasion that is a religious rite and a political sacrament as well as a spectacular pageant. All eyes and thoughts are turned to the west door. Slowly the procession enters. First the Abbey beadle in robes of silken blue; then the ten chaplains in ordinary scarlet—hooded; after them the domestic chaplains, the sacrist bearing the Cross of Westminster, followed by more ecclesiastics. Then the pursuivants, all gold and tabards, and the officers of the order of knighthood in mantles of glimmering hues, heralds in blazoned coats, household officials, great nobles bearing the standards of the British Dominions, India, Ireland, Scotland, England, and the United Kingdom, Lord Lansdowne holding aloft the Royal Standard, the four knights of the Order of the Garter appointed to hold the canopy for the King's anointing, great political dignitaries, chancellors and Lord Chamberlains, the Archbishop of Canterbury, more pursuivants, the bearers of the Queen's Regalia and then the Queen herself—pale and tense with emotion but splendidly dignified—her stupendous train borne by eight ladies in snowy white and followed by double dazzling lines of attendant retinue. It is an incomparable moment as the procession flashes onwards and the organ and choir burst into the noble anthem, "I was glad when they said unto me, We will go into the House of the Lord," and the Westminster boys fling out their greeting, "Vivat Regina Maria! Vivat, vivat, vivat!"

There is a pause of but a moment and the final procession enters the Abbey. One watches the passing of the King's Regalia with a certain impatience even though Lord Roberts and Lord Kitchener are among the sword-bearers and the Golden Orb and the Sceptre with the Dove and St. Edward's Crown are among the precious treasures. At last firm and upright, in his crimson robe of state, flanked by two Bishops and an array of Gentlemen-at-Arms, followed by his train-bearers in red and white and attended by a glowing company of officials and Yeomen of the Guard, comes the King—while the anthem swells to its second movement and the "Vivats" of the Westminster boys crash out again. The service begins at once, that unique and noble service, a tissue of mediæval mysticism, chivalry, feudalism, ecclesiasticism and politics, blending the sacred and the secular into a pact between the King and his God and the people and their Sovereign. The anointing with oil, the solemn benedictions many times multiplied, the investiture of the Sovereign with quasi-sacerdotal robes, the delivery to him of the Regalia with prayers and injunctions—make it in certain aspects predominantly an ecclesiastical ceremony. On the other hand the fourfold

Recognition with which the service opens and in which the Archbishop, turning to the four points of the compass asks the people whether they are willing to do their homage and service to the King, recalls the time when monarchy was elective or rested on the fortunes of war; and the administration of the Oath emphasizes its secular and political side. Then again the touching of the King's heels with the golden spurs, the girding on of the sword, the presentation of the glove, and the homage of the Bishops, Princes and Peers recall the ideas and practices of feudalism and chivalry. And the whole of this curious service, except the Recognition, is embedded in the Communion Service of the Church of England, at which the King and Queen themselves devoutly communicate. Is this amazing and yet moving medley, written in the noblest language and with no part of it that does not bear the seal and warrant of the centuries, destined, I wonder, in the quick-moving times that lie ahead, to be the enduring form which the covenant between the English monarch and his people is destined to assume?

But there is scant leisure or inclination for such questionings while the service itself proceeds, while one's ears and mind and heart are filled and stirred by the chanting of the Litany, while beneath one's eyes the solemn Coronation Oath is administered and the King is seen to kiss the Bible and sign the roll, while the four highest of English noblemen hold a gleaming canopy of gold over his head and the Archbishop anoints him, while the chivalric investiture is in progress, and while, when the crowning is accomplished, the Peers with a blinding, simultaneous movement put on their coronets and "God Save the King" resounds through the Abbey, and the trumpets blare, and far off one hears the cannon thundering the glad tidings to the world. Each one of these separate ceremonies has its unforgettable moments when everything that color, music, the utmost splendor of costume and of language, and the solemnities and mysteries of religion can do to flood the emotions and dazzle and beguile the senses is done with superb and compelling effect. The passage of the Regalia from throne to altar, the assumption of the emblems of temporal power, the first moment when the crowned and anointed King turns round to face his subjects, the helping of the King onto his throne in reminiscence of the days when the monarch was lifted shield-high for his people to see, the thrilling flavor of a thousand years of kingship in the words and act of homage, the coming and going of magnificent dignitaries with emblems whose significance is woven with the earliest annals of English nationality, the unrobing of the Monarch at this moment in obedience to hallowed forms, his investment at that moment still in accordance with traditions and meanings that were ancient five hundred years ago, the bowings and kneelings, the prayers and oblations, the crowning of the Queen, and that culminating scene when King and Queen and Bishops kneel at the altar rails and receive the Communion while the tremendous words of the Anglican service roll in beauty through the listening Abbey—these are episodes that must surely, in their union of the deepest of messages with the most gorgeous of pageants, stay printed on the mind forever.

It is over. The Benediction has been pronounced; the Te Deum is ringing out; the King and Queen have passed into St. Edward's Chapel behind the altar. In a few moments they reappear; the processions are reformed; the Queen bearing in her right hand her Sceptre and the Cross and in her left the Ivory Rod with the Dove and wearing her Crown, passes thru the choir and down to the west door, the central and most imposing figure in a long line of beauty and splendor; two minutes later the King wearing the Imperial Crown, in his right hand the Sceptre with the Cross, emblem of kingly power and justice, in his left the Orb, follows in the midst of his retinue; the organ peals "God Save the King," and cheer after cheer breaks from the brilliant ranks of guests and spectators. Without a hitch and with every circumstance of historic pomp the great ceremony is consummated, and as we leave the Abbey there is borne to us the thunderous cheers of the multitude without acclaiming their crowned and anointed sovereigns.

Westminster Abbey, London, England.

# Industrial War or Peace

BY THE RT. REV. CHAUNCEY B. BREWSTER, D.D.

[In our issue of June 29 we published an article by the Bishop of Connecticut on "Employers' Liability." The following article on recent experiments in profit sharing is the second one under the general title of "Industrial War or Peace."—EDITOR.]

ANYTHING would seem to be desirable which would tend to associate capital and labor for mutual advantage. Such a result would seem likely to be attained if to the workman might be allowed to accrue some share in the profits of the industry. The possibilities of profit-sharing lie in its effect upon the employee, human nature being what it is, in its promise as regards quantity and quality of product, saving much waste of time and material as well as wear of implements, and a lessening of labor disputes. Such results are to be looked for from admission of the worker to a stake in the business.

Toward solving the labor problem, profit sharing goes some way so far as it serves to overcome antagonism between employer and employed by humanizing their relations. Into the problem it brings the human and personal factor in its recognition of the workers as something more than the employer's machines, as men of like nature with him and entitled to a right recognition of some common interest between them and him. The omission of that human factor has been a fact only too familiar. A famous type is Plugson of Undershot.

"He enlisted his thousand men; said to them, 'Come, brothers, let us have a dash at Cotton!' They follow with cheerful shout; they gain such a victory over Cotton as the Earth has to admire and clap hands at. Plugson, buccanier-like, says to them: 'Noble spinners, this is the Hundred Thousand we have gained, wherein I mean to dwell and plant vineyards; the hundred thousand is mine, the three and fivepence daily was yours; adieu, noble spinners; drink my health with this great cash, which I give you over and above!'"

A great captain of industry in our day, Mr. Andrew Carnegie, has recently said:

"Every employee should be an owner, and then there would be no trouble. If I were to go back into the steel business that is the first move I would make. I would inaugurate profit-sharing with the men."

The principle of labor's participation in profits had been recognized by Turgot in the preceding century. But practical profit sharing was begun in 1842 by Leclaire, a Parisian decorator, who showed the qualities of genius. His example has been followed, and with success, by many firms in France, and by a somewhat smaller number in Great Britain. In America, Jefferson's Secretary of the Treasury, Gallatin, advocated the principle and seems to have made experiments in it. The history of the movement in its earlier stages has been thoroly told by N. P. Gilman, in his work, "Profit Sharing."* This country was slower than Great Britain or France to take up profit sharing; but in the last third of the nineteenth century there were many experiments and a large proportion of failures. The plan has been given up sometimes by the employer, sometimes by the employed. In one case, with which I was somewhat familiar, after a very generous scheme had been working well for two years, the men abandoned it to join a general strike, thereby forfeiting, at a low estimate, a dividend of $11,000 due within a month, and $8,000 in wages. That, however, it may be noted, was back in 1872, when the principle in America was in its infancy and had not established its strength sufficiently to withstand strong pressure from without. In a fair number of instances the plan has survived the experimental stage.

In recent years there has been adoption of the principle on a large scale. For instance, the International Harvester Company and its subsidiary and affiliated companies devised a plan which includes a distribution in cash out of the earnings each year, and also the sale of stock to the employees on the instalment plan. By purchasing stock the workmen of course

*Houghton Mifflin & Co., 1889. The same author in "A Dividend to Labor," 1899, traces the movement to that date.

participate, so far forth, in the ownership. Since 1903 the United States Steel Corporation has had in operation a profit-sharing plan which is generous and attractive. Out of the earnings a certain percentage is set aside, half to be distributed in cash and half invested in preferred stock, to be distributed by a certain method. The plan, moreover, included an offer to the entire organization to purchase stock upon certain conditions.

Where the profit sharing has not succeeded, among the causes have been failure in some instances to earn any profits at all, and in others dissatisfaction of the men with their share. Behind all, however, and of essential import to the real success of the plan, must be the questions: How and why, and in what spirit, it is proposed to the men. There is to be encountered a perhaps not unnatural suspicion. Mr. George W. Perkins, who sees the possibilities of profit sharing, has frankly said,† of some plans that failed, that they

"did not embody a true, an honest, and a fair spirit of co-operation. A secret, perhaps almost an unconscious purpose existed to benefit the business in question out of proportion to the labor employed in the business; and no such plan having such a purpose can permanently succeed, for the selfish points in it will work to the surface sooner or later and cause failure."

It is evident the plan must be presented as a measure of justice and right dealing, not of paternal benevolence. The United States Steel Corporation in 1903 offered its men stock for purchase at a lower price and with guarantees which were calculated to give and, in fact, have given the men a very handsome return on their investment. In the statement of conditions, however, published in each yearly announcement, have occurred certain phrases, touching the employee of the corporation, viz., "Has shown a proper interest in its welfare and progress," "Whom it shall find deserving," phrases which, however they may have been actually construed, seem to go behind the doing of satisfactory work, and are suggestive of a paternalism inconsistent with genuine democracy.

To profit sharing there has been a general opposition on the part of labor organizations. Sometimes there may have been an instinctive fear that such adjustment would threaten the very business of the unions. But, should the wage war be succeeded by lasting peace, the unions might still perform most valuable service. A chief objection is explained by the fact that profit sharing proposals have often seemed to be associated with opposition to the principle of labor organization. In some instances the avowed purpose has been to destroy the unions. In some cases participation in the benefits of the scheme has been expressly conditioned upon withdrawal from membership in the unions. In other cases it has seemed to be a device to lure men from them. It will not in the long run meet the need to present any profit-sharing plan, however generous, which may justly be considered as a bribe to induce the men to abandon the labor organizations for the sake of getting what may benefit themselves, but not the mass of their fellow wage-earners. It is natural that men who believe that the general improvement of their condition depends upon organization should resent attempts even indirectly to interfere with the strength and efficiency of the organization of labor, and view with suspicion schemes which seem to look or be likely to work in that direction. It would seem possible to find some way of furnishing a dividend to labor which should be compatible with due recognition of the right of labor to organize.

The difficulty did seem to have been successfully met in a recent instance in England by Sir Christopher Furness, at his great shipbuilding yards at West Hartlepool. In October, 1908, he proposed that the men should become limited copartners by holding shares in the capital, on easy terms of payment. These shares were to bear a fixed interest at 4 per cent., and, furthermore, after apportionment for the interest on the capital at 5 per cent., and for reserve and development funds, whatever profit might remain would be divided between the employees' shares and the other shares. Over and above the monetary aspect was held out the promise of amity instead of friction, of cordial relations of co-operation. To this end was proposed a works council, to be composed of representatives of the firm and of the

†Before the National Civic Federation.

employees, and to include also outside representatives of the trades unions. This was to be a medium of intercommunication and of mutual discussion. There was to be no strike and no lockout. If thru the council any issue could not be settled, there was provision for a court of arbitration.

These proposals were, after discussion, deliberated upon by the several unions, and by a large majority accepted. So was launched a copartnership which admitted the workmen to a share in the profits and recognized the principle of association in unions. It seemed an encouraging example of that which Professor Jevons declared would be the best of all trades unions, the union between labor and capital. For 1909, dividends were declared of 10 per cent. to the regular stockholders and 9 per cent. to the employee stockholders. But, in April, 1910, it was announced that a majority of the workmen had voted against the continuance of the plan, a large number of them not voting. The reasons for this action, so far as I have been able to learn them, would seem to be only incidental and not to be essentially involved in the principle.

Notwithstanding this discouraging instance, the horizon is bright with promise. The general principle of profit sharing has begun to emerge from the stage of crudity and experimentation. There may yet be mistakes and failures. But some of the ablest men of our time are deeply interested and engrossed in study of the problem. We may reasonably hope there may be devised methods whereby to surmount the difficulties and to apply the principle in such wise that, while not a patent cure for all industrial ills, it shall mean a long step toward better relations and a better spirit.

The subject of arbitration has not been entered upon. It would require more space than can here be afforded. In industrial as in international relations, there recurs the persistent question whether war is a normal necessity. The "class war" we have heard of from the Socialists. By the majority of them it is still insisted upon as a basis of the cause they advocate. It is proclaimed as a necessary law. The doctrine of Marx and his followers is that, so long as there are employers, the employed must be their wage slaves. Between them must be enmity. Their interests are in conflict. What the one side gains the other must lose. There can be no mutual gain. Why not? It is a query which, I venture to think, has never been conclusively answered and is fortified by observation of the results of fair profit sharing.

It remains a question whether class consciousness necessarily, inevitably and forever must mean war. Something better than this is surely conceivable. Something better than this seems not impossible. It has been my aim to show that indications are not wanting of something some day coming which, because it is to rest upon the essential unity of man with man and their interdependence, promises to be more genuinely and fundamentally social than the Socialism that is avowedly based upon the antagonism of class to class.

Significant in this connection would seem to be the National Civic Federation, bringing together as it does representatives of capital, of labor, and of the general public on the same platform. It was inevitable that it should meet with criticism and denunciation from certain organs both of labor and of capital. Perhaps to be expected at this stage is the opposition of some labor organizations, for instance, the action whereby Mr. John Mitchell has recently been forced to withdraw from the Federation. Unfortunate as such a result confessedly is, none the less can one who really believes in human nature help hoping much yet to come from the mere bringing together, into relations of mutual comparison, discussion, friendly understanding and co-operation, of reasonable men who represent differing and opposing interests.

In the general movement we have been concerned with there is the economic side. Men are learning from experience that it is poor policy and bad business to be forever fighting, that it pays to have other relations than those of mutual suspicion and hatred. We catch glimpses, moreover, of another side. As we see men turning from competition and conflict to co-operation, we get intimation of something else. It is the stirring of impulses and convictions in regard to right deal-

ing, brotherhood, helpfulness from man to man, and bearing burdens together. It is that touch of our better nature that even in the industrial world makes men kin. It gives good reason to hope for some issue looking toward the reintegration of society, and the reconciliation of warring elements. In that day which, however distant, is we hope destined to dawn, when instead of perpetual strife there shall be just arbitration and agreement in common purposes, when to industrial war shall ensue peace; then, in this transcending of solely selfish and clashing aims, and in this bringing of contending wills and interests that seemed conflicting into concordant harmony, shall be found the highest value of the industrial process, seen thus to serve higher than material ends.

HARTFORD, CONN.

# Travesty

BY RALPH M. THOMSON

GOD help the state, of endless ills the tool,
Where judges slink, and politicians rule!
The rich and poor a frazzled thread divides,
A tip from Fortune and the beggar rides.
But when courts fear the wrath that may arise,
Traditions perish and all manhood dies.
What mockery to prate about the law,
When immuned culprits ever find a flaw
Thru which they may escape, to mix again
With decent, honest, self-respecting men!
What means the ballot, that eternal trust
Inherited from them whose bones are dust,
When mental pygmies and depraved buffoons,
When slimy asps and wriggling, spineless loons
May prostitute its sacredness, and dare
The minions of the wig to interfere?
When low-born scullions, reeking with their stench
May give an ultimatum to the Bench,
And amble forth to gaze on freedom's sky,
Unpunished by the weaklings they defy.
When men who pose as paragons of right
Prove traitors to integrity and might,
And swoop to buy from every imp of hell
Who signals that he has a vote to sell;
And when the people wreathe indifferent smiles,
And, thru inaction, countenance the wiles
Of them who traffic, and in manner bold,
In bartered birthrights, and for dabs of gold—
Small wonder Justice is portrayed as blind,
With bandaged eyes, and sword at rest, resigned;
And well may we, before it is too late,
Cry needfully to heaven: "God help the state!"

SAVANNAH, GA.

# The New Point of View in the New South

BY ENOCH MARVIN BANKS

[In THE INDEPENDENT of February 9, 1911, appeared an article by Professor Banks, entitled "A Semi-Centennial View of Secession." As this article frankly questioned the soundness of some of the South's cherished views, it was taken up by a few hotheads, and to the eternal disgrace of Florida and its State University, Professor Banks was forced to resign his chair in the University. The whole case has naturally elicited a widespread discussion thruout the South, especially in academic circles. We are glad therefore to print another article from the pen of Professor Banks. We comment upon it in our editorial pages.—EDITOR.]

IN the past century two mistakes large in serious consequences were made in our country in regard to the negro. The South is primarily responsible for one of these mistakes and the North is primarily responsible for the other. The disastrous consequences in each case fell primarily, tho by no means exclusively, upon the white race, and since such is likely to be the outcome of any present or future error of policy in regard to the racial problem it behooves us to take counsel with the finer qualities of our nature and judgment in order that we may lay plans for avoiding any possible future disasters of similar magnitude. The two mistakes have also tended to accentuate an estrangement between the sections that is passing only with the lapse of time, tho a frank recognition and acknowledgment of its own mistake by each section, together with the operation of other influences, are tending to hasten the spread of a genuine spirit of national harmony and good-will. Indeed it is being more and more recognized that progress is not primarily promoted upon the basis of a developed fellow feeling that makes possible a wide co-operation in the execution of the world's constructive program of action. Reference is therefore made to the mistakes of the past in no sense for the purpose of reviving bitter memories and animosities, but rather in the hope of laying a foundation for a wider mutual accord and for a larger spirit of constructive co-operation in tasks that demand for their wise execution the highest type of statesmanship and the broadest catholicity of spirit.

The first fundamental error that brought serious consequences in its train manifests itself in the attitude of the South toward the institution of negro slavery especially in the generation prior to the sixties. My former article in THE INDEPENDENT attempted to present the error in the southern position which culminated in the Civil War. While the student of social psychology can easily explain the southern attitude and can see the influence of economic and other social motives at work in its formation, still the error of the attitude is none the less apparent. While the conscientious historian will recognize in the main the sincerity of such southern leaders of opinion and action as Calhoun, Davis, and others, still the logic of progress will no doubt force him to admit that they made a fatal mistake in exerting their high powers of mind and character in the work of devising constitutional and other means for the defense and extension of slavery, instead of bending their energies to the task of setting in motion sane influences in the South that would have made it possible not only for the national government to exclude slavery from all the western territories, but also for the southern state governments to carry through policies looking to the gradual emancipation of all the slaves within their jurisdiction. Had our southern leaders followed the latter line of policies they might easily find a rank among the really great constructive statesmen of the world. However, their line of policies pursued the opposite course and thus led directly to the seces-

sion movement which in its turn precipitated a gigantic war for the preservation of the union.

This war entailed upon the country, North as well as South, great agony of soul and sacrifice of life; it drew into its destructive vortex, North as well as South, a vast quantity of wealth reaching into the billions of dollars; it brought on the liberation of the slaves without a penny of direct compensation to the owners; it brought in its train all the humiliation and bitterness of the reconstruction period; and it has entailed a subsequent pension burden upon the nation that already approximates $4,000,000,000—an amount sufficient in itself to have paid a fair price for all the slaves in the country in 1860. To be sure, viewed from a world standpoint two principles of the highest importance—the unity of the nation and the freedom of the slaves—were definitely wrought out and established thru our civil war; but it is now desired to emphasize the fact that these principles cost the whole country a greater outlay of wealth and anguish of soul than their establishment ought to have cost. Wise leadership in the South in the generation prior to the sixties in matters moral, religious, political, and economic, might easily have paved the way for the triumph of both principles without even the symptom of a social cataclysm. A teaching of history that fails to bring out such truths is worse than useless and does not harmonize with the spirit of our age which is seeking not only to reduce the occasions for war but also to lead mankind upon a highway of progress that will gradually eliminate many other phases of human weakness that are responsible for the great misery and suffering which have heretofore been regarded as normal and essential elements of human experience.

Just as the South made a grievous mistake in formulating plans for the perpetuation and extension of slavery in an age when the world was demanding its restriction and elimination, even so the North committed a serious blunder in the era of reconstruction in attempting the wholesale enfranchisement of the newly emancipated slaves. The South in the earlier period was running counter to the true path of social progress in clinging to a system which, whatever may have been some of its beneficent phases, had been ruled out of court by the advancing civilization of the world: The North in its schemes of radical military reconstruction went too far in the other direction in transferring the negroes from slavery into an immediate control of the southern state governments. From slaves with very restricted rights and responsibilities they were suddenly metamorphosed into freemen with all the rights and civic responsibilities of the white men. This very naturally intensified existing disorders, bringing indeed a degree of chaos to southern society, and created a bitterness of feeling against the North and against the negro which has handicapped the true progress of all concerned. The nation needed in that emergency the leadership of Lincoln whose natural sagacity, breadth of view, and generosity of soul, acting upon the basis of a masterly acquired prestige, might have carried through policies with regard to the conquered South and the freedmen that would have made easier a progress that has been slow and difficult. To be sure, the policies actually adopted were in many instances inspired by the laudable purpose of guarding and promoting the interests of the weak and newly emancipated element of the population. But the policy of immediate wholesale enfranchisement was none the less fallacious and its adoption left a legacy of disastrous consequences not only to the negroes and the whites of the South but also to the nation at large. However, the northern historians and students of society as well as the other more thoughtful citizens of that section are very frankly and generously acknowledging the mistake involved in foisting military rule upon the conquered South in support of the premature political privileges of the freedmen.

Both sections have therefore made errors in dealing with the negro—the one an error in the way of following policies too repressive and reactionary in their tendency, the other an error in the way of advocating policies too idealistic and revolutionary to fit the actual situation in such a manner as to promote sound progress. It is hoped that this paper may

indicate in some measure at least the pathway of progress along which the better leaders of our day in both sections are moving in an endeavor to forward a wise adjustment of what is perhaps America's greatest social problem as well as a wise solution of other problems more or less peculiarly southern. If leaders can enable the two sections to allay their distrust and cease petty bickerings and with generosity of soul join hands in constructive policies looking to the gradual redemption of a race to the building of a radiant civilization they will be entitled to a crown of rejoicing in the present world as well as a crown of immortality in the world to come.

The creation of a proper attitude of mind and spirit among the people at large is the first desideratum if errors in the future no less serious than those of the past are to be avoided and if positive progress in the wise handling of our racial problem is to be made. Such ideas do not smack of utopian impracticability in the eyes of those who are already touched by the dominant tone of the present age. It is perhaps safe to say that the dominant tendency of our age arises from an increasing spirit of human brotherhood coupled with the ascendant belief that man and society can, through conscious effort, largely modify and determine the course of human progress. Our public health and world peace movements, our great philanthropies, our vast educational system, and many other large programs of the age are based primarily upon this philosophy of the solidarity of social interests and the possibility and desirability of consciously promoting the social welfare. The South in relation to its greatest problem must harmonize its attitude and policies with present world currents of thought and action or it will again suffer the dire consequences of a mental and spiritual inertia such as gripped it in the generation prior to the Civil War.

It is not enough for the stronger race to cultivate a spirit that would offer cordial help and encouragement and opportunities to the weaker race, but it is also a desideratum that the policies of uplift be based upon the widest possible knowledge of the actual situation together with an appreciation of some of the general principles of civilization and progress as these principles are made manifest in the evolution of human society. This implies, of course, that very few of us, if indeed any of us, are at present thoroughly qualified in point of knowledge to give a wise direction to any broad line of policies with regard to this transcendently important problem. It does not follow, however, that instinct and the blind forces of the past must be allowed to determine those policies. All the medical and hygienic knowledge now being employed to alleviate suffering and lengthen life has been wrought out by the human mind; all the important principles of chemistry and physics now serving man in a thousand ways have been acquired by dint of observation and study; the splendid array of inventions and discoveries now marshaling the forces of nature in the service of mankind are achievements to the glory of man's intellectual powers. In view of all these achievements that might be extended into the thousands if we cared to particularize, why should it be thought a thing incredible that man should successfully turn the vast resources of his mind upon the problems of improving his economic, moral, political, and other social conditions and relations? It can be done, verily it is being done as never before in the history of the world, and the achievements of the twentieth century in the way of thus consciously elevating the type of our civilization are destined to transcend the most daring speculations of the present. The world has never before seen anything comparable to the vast number of persons now devoting their lives to the scientific study of human society with the avowed object of getting sound bases for ameliorating the lot of mankind and for directing the course of human civilization; nor has the world ever before witnessed the establishment of so many agencies, public as well as private, designed to abate the causes of human misery and to elevate the standard of individual efficiency and social achievement.

There are at least three sections of the population of the South whose elevation and improvement it should be the distinct object of wise policies to accom-

plish. One is a rural white element consisting chiefly of tenants or "croppers" who are to be found in large numbers thruout the entire cotton belt. These need the stimulating touch of the best agencies which an advancing civilization can bring to their service in order that they may become efficient producers with an enlarged participation in the better things of life. Then there are the mountain whites representing a vast store of native human capacity which should be invigorated by proper agencies and thus qualified for the task of contributing a worthy share toward upbuilding the industries and the civilization of the South. The negroes form the third important element in the population whose conditions, relations, and possibilities demand for their wise appreciation and handling neither passion, nor prejudice, nor crude sentiment, but scientific study inspired by a genuine desire to lay plans for drawing out and developing all the latent possibilities of progress inherent in the race. The problems of increasing the efficiency, enlarging the opportunities, and raising the standard of living in its broadest aspects, of those who fall within the three great groups just mentioned present tasks that will tax our highest capacities for thought and study as well as our largest capacity for wise action.

Because of its racial phases the problem of helping the negro to become a social asset is beset with peculiar difficulties. There is a widely prevalent instinctive prejudice against the negro, especially on the part of certain elements in the white population, and it is very easy for politicians of a certain type to gain an ascendancy by making adroit appeals to this prejudice. I have heard such appeals and have seen audiences wildly applaud the demagog who was thus training them in the spirit of mob action, instead of training them in the spirit of a sane and deliberate discharge of their duties as citizens. It is therefore highly important that the wiser portion of the population be not remiss in their duty to discredit the fanatic, the bigot, the demagog, and the yellow journal in relation to a question that requires profound study, breadth of vision, generosity of soul—in a word, the high qualities of statesmanship—for the mapping out of wise programs of action.

It remains to indicate some of the specific agencies thru which are to be developed and fostered the sane attitude and the sound policies that are required in this work of social regeneration. The primary responsibility in this work will rest upon our educational system, and our colleges and universities are to be the chief sources of inspiration and equipment for its prosecution. Indeed, we are just beginning to appreciate the real function of a university in a democratic society. Heretofore its work has proceeded upon the basis of the relatively inane classical ideal instead of its proceeding upon the basis of furnishing the largest possible equipment for life and social service. Our universities must become plants for the investigation, teaching, and dissemination of truth that has relation to human welfare. Nothing so fortifies character as a grip on truth coupled with a desire to use it for the benefit of mankind—not indeed a grip on merely one truth, for that makes a fanatic or a bigot, but a commanding grip on a wide range of truths. In these truth-building and character-fortifying plants most of our leaders are to be trained for effective citizenship and constructive service. Here our ministers of the gospel, our public school teachers, many of our farmers and business men, our physicians, our editors, our lawyers, our legislators, our judges, our governors, and other leaders of public thought and action are to receive their inspiration and training. Upon our colleges and universities is therefore to rest the burden of tremendous responsibilities since they thus occupy the most important strategic positions in guarding the interests of mankind and in controlling the destiny of our civilization.

The high-schools, touching as they do a larger number of the people than the universities, should themselves become potent instruments of social uplift in the hands of teachers trained at the universities to see that high-schools can become such instruments of power by adapting their work to the varying needs of communities and sections of the population. The elementary schools also, touching as they should every member of the com-

munity, may come in for a large share in this work when they are properly manned and supported as well as more wisely adapted than at present to the task of training for social life. The church inspired by the spirit of the Christ and invigorated by the teachings of modern social science may also serve powerfully the cause of human progress through the agency of its pulpit and press, and thru the agency of many practical lines of social activity. In contrast with some of the early and later Christian teachers, the twentieth century church will emphasize the importance of bringing the kingdom of heaven to pass in this world instead of directing primary attention to the kingdom of heaven in another world. Such a change of emphasis will rejuvenate the power of the church by expanding its usefulness in relation to human needs.

The press in the hands of a body of well-trained managers and editors may also become a mighty agent in proclaiming the harmonizing and upbuilding influences of the age and in leading public opinion to the support of policies that are baptized in the spirit of the widest humanity and vitalized with the breath of an advancing civilization. While writing this paragraph there comes into my hands a copy of today's (June 25) *Atlanta Constitution*, the general tone of whose editorial page admirably illustrates the new spirit of the new South, advocating, as it does, a liberated intellectual life, a nationalized sentiment, and a general expansion of our educational programs to the end of qualifying the section for its constructive work and for a full participation in a richly diversified national destiny.

NEWNAN, GA.

# The Prayer of Summer

BY MARGUERITE OGDEN BIGELOW

*Boy and Girl.*

FROM the nights of mist and moonshine,
From the ardent days of summer,
From the daisy-dimpled meadow,
And the milkweed-scented roadside,
And the quiet pools sequestered,
Where the water-lilies blossom
And the dragonflies are mating—
Hasten we into the woodland,
There to bow before our Father,
Offering the prayer of summer.

*The Boy.*

Grant me greater body prowess,
Healthier skin and tauter sinew,
Speed in swimming and in running,
Hardihood and strength in climbing
Upward from the river valley,
Where the turtles plunge and paddle,
Upward on the sun-baked hillside
To the crags by hemlocks guarded;
There to look abroad and visit
With glad eyes the spreading distance
There to look abroad and challenge
All the future and the distance
To a fight—the future beckons!
Certainty of quick decision
Grant me, when the need is greatest.
In the game or in the battle
And at sundown let me listen
[illegible]
Windswept [illegible] and ripples lapping,
Grant me faith and faith, full stature
Of the manhood I am making.

*The Girl.*

Grant me health, the flush of wonder
Won by riding thru the woodland,
Or by tennis, or by rowing;
Grant me swift, untrammeled action
Of my mind and of my body,
Greater verve and proud endurance
Of each little daily hardship,
Soundest nights and vivid daytime.
All my human woman nature,
Let me find alert and active,
Natural and bright in blossom
As the open fields of clover.
I would be as lithe and supple
As the willows by the river;
I would climb the highest hill-tops
That have known my brother's footstep;
I would read on sunny beaches
Many laws Thy hands have graven
So to learn the mighty secret,
Thru the woodland softly whispered,
Of my life and of its meaning.

*Both.*

Where the wood is darkest, deepest,
We, Thy children, bow before Thee,
Claiming bounty of Thy bounty—
Health and strength and poise of body
And of mind, a drawing nearer
To our fullest human beauty—
In the nights of mist and moonshine
In the ardent days of summer,
Offering the prayer of summer.

[illegible], Ga.

# Scouting

BY E. P. POWELL

Author of "The Country Home," "How to Live in the Country," Etc.

BOY scouts are not a novelty. In my very boy days we scouted after the cows for father, and then we helped milk them. We scouted the weeds out of the onion beds, and there was no baseball nine in all the world. But the sun shone; and the apples blossomed, and there were wild strawberries, and we scouted for them. The girls were scouts too—in blue calico. They scoured the tin pans, skimmed the milk, and played fox and geese in the snow. Then we all scouted together in the corn fields, and we picked up potatoes together till our backs ached; and we helped in the pink beds. I am sure we did not need to go away from home to scout, although there were only two pianos in our township, thank the Lord! And these were elaborately covered over in the spare rooms, and seldom touched but to dust them. Good piano playing is delightful, but scouting, ah, that is another thing.

But if there are boys and girls who are not needed at home to take the burdens off old age, let them scout all over the neighborhood till they find somebody to help. Dear me, but how well I remember those dear church boys of mine, who came to evening service, each with a blessed girl on his arm; only the handsomest of all, Harry Hull, came down the middle aisle firmly linked with his mother. And his eye caught mine with a diamond snap, and her eye was so dimmed with bliss that she did not need to ask the Lord for more. I have an idea God got the world up on the scouting principle; only the right sort of scouting begins at HOME; and so far as I can see schools and scouts and a good deal of church work forget all about father and mother, and the behind-fence duties.

Yes, we all scouted together in those days; the mother knitted and quilted, and the daughter knitted and quilted; and they spun their home-made yarn and made soap together. The mothers, dear souls that they were, did not need to go away by themselves and play bridge; and I wonder if we would look back so yearningly for them if they had. Puritanism had a wonderful power on woman. It brought religious sentiment into such close accord with the feminine instincts that to-day the Church would go to pieces without the mothers. What we want above everything else in our social evolution is to preserve the mother instinct. When that is gone the suffraget can accomplish very little if she have the ballot.

When one of my parishioners, a man of wide business associations, was dying, I asked him what he wanted most. And he said, "I want my mother; I don't want anything else in this world or any other—I just want to see that blessed woman, the one who bore me, who carried me, kissed me, loved me into decent manhood, taught me all the good there is in me; and never asked for any pay, and I'm afraid she never got paid. All the rest is rubbish. I could have got on without the rest; but I want my mother. I want her arms around me. I know it is second childhood; but let it be childhood, it is better than all the manhood the world has ever taught me. God got nearer to me in my mother than in any other way. If I can find her I won't have to hunt for Him. They won't be far apart." Yes, mothers who scouted with their boys and girls brought God very near to them.

I was never in my life happier than when the little mother scouted the woods with me for spring beauties and anemones, and later for fringed orchids and moccasin plants; when she named for us ginseng and witchhopple and wild hazel, or helped us pick up beech nuts by the Harding Brook—while the squirrels scolded us—for indeed did they not own what they could harvest? and what right have we to more? Yet I cannot quite say which was most delightful, these hours with the mother soul, or when our father shook the chestnuts, saying to us, Come, for the squirrels have their share, and there is enough for all of us; and gently he taught us the fine manhood of co-operation in Nature, and how we should help the birds and the animals, as we also take their help; and so all live together with one Lord in one home. At night with much climbing and scouting we went home with aching legs, and was it not then best of all when the hand of the little mother rubbed us much as one would rub a pony; and she said, Little Ned! you need not wear out scouting, for truly the Lord will have need of these legs by and by. You'll see; yes, you'll see! And truly it has been so; and I am glad that legs can worship God as well as tongues. Nor am I quite sure that one might not better hang salvation on good sprinting than on good praying. The tongue has some advantages, for it can go a long distance, and it can be very boastful; and yet I advise you to try the legs if you care for service in God's church—which I take to be the whole world itself.

You will be astonished when you really begin scouting about home, to learn how much there is to scout for, how much to discover and find out. Some folks know a deal about every spot on earth, except home. They will tell you about Bombay and Paraguay and Manchuria, but their own twenty acres holds only dulness. I should not like to have my boy scout in that way, away from home all the time, until home gets to be the most remote and the strangest land in the world. Is it not barely possible that we may organize too much? Was there ever anything more perfectly conceived than the family band? Farm life as it may be lived in America, and as it sometimes is lived, is the completest, the one all-sufficient organism yet devised. Beyond that let us have the town, that is the old-fashioned tunship. But as for clubs on every corner, I am not so sure of it. Some one sent to me a boy to spend a few months learning horticulture. The father wrote me, "This fellow wants to go somewhere to learn something and be somebody, as if he could find nothing worth the while about his old home. I think it the best thing to let him scout for a while. I hope you will show him something worth the while." I found he was a sprinter. It was wonderful to see that boy's heels fly over the tops of the timothy and clover, when there was something else to do. As for his head it only went because his heels had gone. It is bad to give too much directive control to your feet. Tom could think of nothing else and talk of nothing else but sprinting; and I was glad after a bit to let him sprint homeward—a fine boy spoiled.

I cannot be quite pleased if my boy outrun all the rest, unless he run for something and something worth the while. That he has toed a line, where obedience or honor or economy are involved, counts. When I was young they used to set me to reading the history of martyrs, men who died because they would not disown a religious belief. I have known a few horticulturists who would fight all day to demonstrate their confidence in a favorite spraying material. Dr. Underwood and John Cary peeled pears and ate them combatively by the hour, each to prove that his selected variety surpassed the others. There is always a chance to do sprinting that comes to some definite end. But when my boy says, "I outjumped them all," or "I outran them all," I wish to know what it was all for. This Tom of mine was a member of the Y. M. C. A. and he had a dozen medals for his legs, that was all. I could not find that he had ever done anything noble or generous.

I am not belittling the new scouting propaganda, not a bit of it. It will probably do a great deal of good, as Sunday schools have done good; but I would rather a school where the young and old go together; and I am just old

enough, or young enough, which is it? to believe that we shall yet use our big town school buildings for all ages, and any old woman may go and learn to read when she is sixty; and better yet, her boy shall learn to make garden with her in the school lot. No; I am sure of nothing, only of God and progress. I am sure that tomorrow will be wiser than today, and we shall not do then just as we do now. And so I think of this scouting that out of it will come some fine things, and so far as it teaches the boys and girls to find themselves out, and to sift and to weigh, and to think, why, of course, we can have none too much of it. Our house doors are too large and they all swing outward. God will never get too old for us to love, nor to love us. The wonderful thing about the Lord's Prayer is that it is just as sweet at eighty as it was at eight, and so it prevents two kinds of religion.

Do not be impatient with me, for indeed I am not wishing to see old things back again, nor do I fail to appreciate modernism. Somehow, since Emerson, we have been learning that the body must be saved as well as the soul. Kingsley and Frederick Maurice taught us that, after all, beauty and strength belong to righteousness, and that sickness is to be abhorred; then Horace Mann told us that God despises a dyspeptic stomach; and so, step by step, we have come on into this scouting age; only do not let us now begin to save the body without the soul. We used to pray for an esthetic heaven, and we talked about the body, the flesh and the devil as our trinity of evil. Among our college boys there were no calves at all nor any biceps; only a few godless fellows used dumb bells and invented baseball. Hugh Miller and President Hitchcock helped us still farther out of our world-hate; and then Walt Whitman jumped the fence altogether.

Indeed I do not wish to see the old repeated, altho I would like to stroll down the pasture lot this morning, where the wild berries gardened themselves and the huge old apple trees bore loads of Sweet boughs and Early Harvest. In those days there was not a typewriter in the United States, nor was there a spelling reform association. We spelled everything out full, with all the letters we could get into it, and that was our pride. I thought, simple head that I was, that things would always be so, and that my boys would go to spelling matches as I had done. Thirty years before he was born I set my eldest boy to study Greek and Latin, to read the English essayists, and imitate Carlyle. We scouted among books, and a library was the chief end of man. The end of education was to teach the architecture of words. And so we had builders who knew to the infinitesimal fraction, the fitting and the fitness of verbs and nouns and adjectives. To their sensitive ears spoke that delicate rhythm that would touch the hearts of readers.

It was this letter craft that I had planned for my children also. But to my amazement the first one picked up things, and did not care for words; the second picked up bugs and living things, and words to him were of little worth; while the third wholly renounced literature and built machines. It was genuine heredity; for they were all builders, only not one built with *words*. I am bound to say, that from my original standpoint they are a stupid set. They will spell "no" for *know;* and for the life of me, I can't see why *knot;* nor what the *k* and the *w* are about in *nolige*. So whether I will or no, I must accept of change. I do not any longer myself scout thru Milton's "Paradise Lost" as a duty, nor do I feel any conscience about it at all, because I am no longer interested in reading Jeremiah after breakfast. I am glad that Job, and the Nineteenth Psalm, and the great parables, are neither ancient nor modern, but eternal; and I love Jesus as a great, big, handsome, human Brother; and a lot of the old questions that were so irritating have gone as the stars go when the sun comes up. They may be there yet, but they do not shine, and only owls see them or care for them.

Shall we overdo this matter? Surely not in the long run. Out of the evolution and the scouting is coming a finer sentiment, a sweeter religion, a manlier manhood, and a reign of common sense. Forty years ago William Lloyd Garrison said to me: "You will live to see justice done to Thomas Paine, and perhaps to

myself; and you will see a lot of hate replaced with love, and the world will not be the worse for it." It was a good prophecy and there is more to come; more of the fair and just and honest. It is a grand thing that there is such a room for progress ahead, and it may take a hundred thousand years yet to make the world anywhere near as decent and comfortable as it can be made by the application of the truth already known. But progress goes on now in geometrical ratio, thank the Lord.

I am told there are 500,000 boy scouts in America, and that every one of them is obligated to be courteous to strangers and helpful to women and children. It will not be discouraging if I tell them that they were bound to just that sort of thing by the fact that they were born of women. It is well also to recall the fact that, some seven or eight hundred years ago, Europe was quite alive with something of that sort, scouting everywhere on horseback and on foot to do deeds of gallantry. The age of chivalry was a woman's age, but it was an age also of gentlemen. It was then that the word gentlemen was invented. I do not think there were any worse things abroad then than there are today, only the new knighthood, thanks to our common schools, takes in a larger proportion of the people. The power of the new movement lies in this, that it is a simple movement, touching everyday life. It picks up the orange peel that might trip the feeble.

It is this new idea of life that is getting hold of us, and it cannot get hold of the young folks too early. The marvel of the universe is not things, but life—life in all its processes; life budding, life blossoming and life fruiting; better yet, life thinking, life comparing, and life hoping and willing. I came, said Jesus, that ye might have more *life;* and that is all that is worth while to say of Christianity, that it gives a richer, broader, completer life; puts away deathly things, deathly habits and life waste. It gives life a purpose; it sends life out to do good; it sends it into the past with conscience and into the future with hope; and all the time it moves collateral with science in making history full of ethics, and the future full of duty. Anything but low vitality, anything but rotting, decay in our middle years—the years that should be full of strength and beauty. God is Life; life in the garden, life in the field, life like the olives and the figs; but broader and deeper, life brought up to the range of thought and hope; and that is exactly what this scouting must do for the boys if it do the right thing; it must make them children of God. It must fill them with clean, honest life.

This is not to glorify athletics, or physical life, only as that is the basis of a full life. Organized matter that has no purpose beyond exercising itself, no end but propagating itself, no purpose outside or beyond itself, is not worth the while. The body and the soul hereafter must go on together. It is a glorious thing to be superbly physical, healthy in every fiber; but a soulless body, or a body with a dying soul, that is the great shame of manhood. Scouting is, or it ought to be, a new way of preaching the gospel of LIFE.

CLINTON, N. Y.

# The Compelling Guest

BY ANNA PHILLIPS SEE

When Sorrow knocked upon my door,
I answered not nor deemed that he
Could ask aught save love with me,
For Sorrow never had come before

And still he knocked. In selfish dread
I barred me in my dearest place,
Yet Sorrow found me face to face
"Forever I'm thy guest," he said,

"For I alone, for thou must give
A welcome to the woes of all
That suffer want or grief or thrall
To thee in peace, with me shalt live."

AMHERST, MASS.

# The Passing of the Home Daughter

BY MARION HARLAND

IN a series of able articles upon "Some Successes of American Women," now in course of publication in a popular magazine, the author—herself a woman—thus touches upon a problem of business life:

"Every place filled by a girl to whom self-support is unnecessary lessens the chance for some girl a little less qualified, makes competition a little keener, and brings down the scale of wages, for both men and women. . . .

"Girls do not realize this when ambition or restlessness drives them out of their homes to seek self-support. Most of them would indignantly deny any part in making the conditions of a workingwoman's lot more difficult and her life thereby a harder one, but it is true, nevertheless."

We have here from but one point of view a problem that has many sides, some of them sorely perplexing to the social economist and yet more distressing to the home-maker and home-lover.

Sixty years ago we all laughed good-humoredly when Mr. Turveydrop apostrophized, "with very disagreeable gallantry," "Wooman! lovely Wooman!"

Reading today that the Master of Deportment added: "What a sex you are!" we are irresistibly reminded of the Scotch minister's comment upon David's "I said in my haste, 'All men are liars'"——

"Had ye been livin' on the airth this day, ye might ha' said it at your leisure, David, me mon!"

For Woman with the big capital letter has the center of the stage, and the limelight is turned full upon her. In her—never forgetting the staring capital letter—the unrest, characteristic of the age, has its fiercest manifestation. In that Long-Time-Ago, when we laughed at Mr. Turveydrop's affectations, there were real wrongs—legislative and domestic and social—of which the weaker sex had a right to complain. Property laws in many of our States bore hard upon them; convention, in the matter of behavior, occupation and locomotion, was unjust and tyrannical.

If she was honored in the church, it was with consideration akin to that showed to the feminine converts from paganism in Paul's missions. They were allowed to work, not to speak in the assemblies of the saints, but admonished to ask of their husbands at home if the sermon shot above their heads.

If the mid-nineteenth-century society belle were toasted as an angel, it was with the full understanding that she was not to fly beyond her sphere.

When sensible men and just recognized the demands of reasonable women for recognition of themselves as vertebrate fellow beings of the feminine gender, iniquitous laws were repealed, conventional bondage became a dead letter, and the working woman fell into step with the working man. Parents who take it for granted that their boys must enter college assume as naturally that their girls do the same. One thousand women engage in active business pursuits now where one entered a shop, or office, or store a half century ago. As was inevitable from the very nature of her being, our emancipated woman inclined eagerly to the ministry of healing, and the trained nurse is one of the benefactions of our age. The doors of medical colleges opened more slowly, but they stand wide now, and many of the sex there be that enter therein. The law schools followed suit—somewhat reluctantly; lastly, and under protest from clergy and laity, a limited number of women wear the title of "Reverend." In the literary and artistic world they have long stood alongside of their brothers.

As a matter of course, a comparison of the mighty difference between the position of the woman of 1841 and that held, unchallenged, by her granddaughter in 1911, has mounted like champagne to the head of the latter. Each triumph gained is an incentive to enterprise. "What next?" comes as naturally to the thoughts and lips of the girl graduate as to the boy who comprehends that his college course is but the first stepping

stone in his career. And this is as true —as our magazine writer intimates—of the girl whose parents are abundantly able to provide handsomely for her now and in future, as of the daughter of the salaried clerk or small tradesman, or of the widow whose annuity will die with her. Her liberal education, she pleads, has so belittled in her esteem the frivolities of fashionable life that she cannot endure the prospect of sinking to the meaningless round in which the butterflies of society float and glitter for a few brief seasons, then to sink into useless nobodies. She longs to be and to do something in this glorious, busy world.

If she be of a practical, logical turn of mind (and why go to college if one do not learn logic?) she argues, and cleverly, for the right to strike out a career for herself. She had it out with me the other day as we discussed this right over the teacups.

"My father is in comfortable circumtances now," said the young, well-modulated voice. "The probabilities are that, should he meet with no reverses, and live to a good old age, he will leave me what is called 'well provided for' at his death. But you do not need to be reminded of the vicissitudes of American fortunes. A fall in stocks, the failure of a bank, depreciation in the value of real estate, a mistaken investment—any one of these things which happen every day to other men, may leave me a beggar, with the option of taking a housemaid's place or"—with fine disdain in tone and look—"marrying for a living! Is it not the part of common prudence to prepare for such changes and chances by learning now how to take care of myself decently and honorably? Look at another aspect of the case. I am well and vigorous. I never had a day's illness in my life. My only brother, five years ago, was graduated from the law school. He has been delicate from childhood, altho not an invalid. Yet he went at once to work, and is now in a fair practice. He would have been called a poor creature and less than a man had he remained at home dependent upon his well-to-do father. Why should I do this? Is dependence more honorable in a healthy woman than in a sickly man?

"Moreover, what is there for me to do at home? My mother is in excellent health and she enjoys housekeeping. Her servants are well trained and competent to do all that would devolve upon mistress or daughter if we kept no maids. I was at a preparatory school for four years and four more in college. Why were time and money expended in my education if I am to settle down to the duties of an unsalaried companion?"

Then she unfolded her plans in detail. She goes to Philadelphia in the autumn to begin a three years' course in a training school for nurses.

I could not help saying: "But will not your mother miss you sadly? She has looked forward so longingly to the close of your college term! You have not really lived at home since you were sixteen."

"If I were to marry and remove to California—would she be less lonely?" was the merry rejoinder. "Yet nobody would protest against that! You yourself would say it is the course of nature."

"As it would be!" I maintained, stoutly.

"'Twas only throwing words away."

Her mind is made up; her plans are matured in the capable brain.

Hers is one phase of the "restlessness" of which our magazinist speaks. It is active leaven that is working thruout what may be designated, in no invidious sense, "the mighty middle class" of American society. A class that is the very bone and sinew, the joints and the marrow of our country, made up of people who do the work and form the character of the nation.

To the higher strata of this class belong three young women whose father, an eminent banker, died five years ago. The daughters are college graduates, and studied abroad for three years after the academic course was completed. They are unusually attractive in appearance and manner, but, one and all, they will tell you that they "have no taste for gay social life." One is an artist and illustrator; another is in a medical college; the third has "taken up settlement work."

The artist sleeps, breakfasts and dines at home, goes to her studio every morning and works there for as many

hours as if her daily bread were to be earned by daily toil. The embryo physician is studying in another city. The settlement worker must live among those to whose betterment she has consecrated her life. She makes it a point of conscience to visit the widowed mother every Sunday, when her duties to the sick and needy do not prevent the call.

The poor rich woman, thus left alone, except for her staff of servants, in her big, echoing house, broods over past joys until, as the medical student regretted to me last summer, "she is in danger of lapsing into confirmed melancholia. It is a pity," added the daughter, feelingly, "that so many women of her generation have few resources within themselves. Poor, dear mamma does a little fancy work, reads a little, receives a few calls from old friends—and *mopes* indefinitely!"

One more illustration from real and present life will complete a list that might be drawn out as our compassionate daughter has it—"indefinitely"—without exhausting my portfolio.

In one of the fairest of New England towns dwell the parents of a pretty girl who has come to the city to study "applied art—and incidentally, the world at large." That was the way she put it when an acquaintance exprest surprise at meeting her.

"I was dying of asphyxiation at home!" she went on to explain. "It was like living in a barrel and talking thru the bunghole! Or, to describe the situation more poetically:

"I felt like a seed in the cold earth,
Quickening at heart, and pining for the air."

"No, I don't know that I have any decided talent for art, but I must be doing something, and the seed might as well sprout in this direction as in any other. And here one *lives* and grows!"

I refrained from verbal comment. I could not have found words to express just what I felt in listening to the flippant tale. My imagination flew to a white-haired man, and a woman who was marvelously brisk and cheery for her seventy years until within the past twelvemonth. That was when Isabel came to the city to set up an establishment with two other ambitious girls. They give delightful "studio teas," and go to all the best plays and have seats in the orchestra for an opera when the fancy takes them. Each has her "specialty" that accounts satisfactorily (to herself) for the voluntary exile from home and relatives. They would declare, if questioned, that they "fairly revel in the upper circles of Bohemia. They meet real people there, men and women with brains and the opportunity to use intellect and energies."

Some of these "real people" play at working for a living. They write for the papers; they paint and draw; they lecture and give "readings," and design book covers and a dozen other things that would be better done by trained workers.

We reread the pregnant sentence which served as my text:

"When ambition or restlessness drives them out of their homes to seek self-support."

Was it Elbert Hubbard who said that "parents nowadays nourish and bring up children in order that they (the parents) may learn how to live without them"?

The bitter truth is not a satire in the light of what we are now considering. From his birth the mother has known that the boy would leave the home nest as soon as he is qualified to take care of himself. It is the law of nature and of life. Her girl is a part of her very self. As she nears womanhood the bond between them strengthens; the secret sympathy grows and sweetens. Their feelings, thoughts and aims are identical, or so thinks the loving soul, in the recollection of her own beautiful girlhood spent under the mother's wing. The girlhood that was the brightness and glory of the home.

I chance to know how the mother of the well-appointed New England dwelling anticipated Isabel's graduation day and the home coming that would succeed that event in her darling's life. She is an only child, and the four years of her college course are registered in the parental calendar by the vacations separating months of heartache and longing. It was for the child's best good, and borne without a murmur. When she should again take her place in the home desolated by her going, all would be

right. When she came back, a full-fledged graduate with a diploma in her pocket, she found her room refurnished and the homestead all aglow with flowers, sunshine and smiles. Henceforth, her mother's life was to be hers.

Can it be, we cannot but ask ourselves, that the self-satisfied girl never suspects that her resolution to "live and grow" according to the dictates of her own taste and will is like dragging out the golden threads which make the rare tapestry valuable? That the pattern, designed by love and wrought thru countless hours of tender dreaming, is marred irretrievably and for all time?

The home daughter of earlier years was such a winsome thing to eye and to heart; her mission in the home was so plainly ordained of God; her companionship so clearly the lawful recompense of the mother's weary waiting and willing sacrifices of personal interest and desire —that we mourn her passing with hearts hotly resentful of the new order which relegates the old to the rubbish heap of effete traditions.

Forestry informs that the ivy may be trained into a tree, and, albeit stocky and dwarfed in hight, it may stand upright and defy the winds. Old-fashioned folk think it more beautiful when it wreathes the old walls with living verdure, softens harsh outlines and helps to bind the stones in their places.

When torn down, the tendrils bring out the mortar into which they have grown and hasten the ruin of the building.

New York City.

# The New England of Tomorrow

BY FREDERIC AUSTIN OGG, Ph.D.

[Those who think that New England will have to give up Thanksgiving Day and keep a perpetual Fast Day may be heartened by reading this article, which shows that the decadence is only imaginary. The Census shows the same thing. Mr. Ogg is the author of "Saxon and [illegible]" "The Opening of the Mississippi," etc.—Editor.]

PROBABLY three out of every four persons of intelligence west of the Hudson and south of Long Island conceive of New England as a section of the country which, if not actually in decadence, has at least attained the zenith of its prosperity. Considering that the subject is under perennial debate by New Englanders themselves, such an assumption by outsiders is perhaps not altogether graceless. Since Daniel Webster complained, in 1820, that "our New England prosperity and importance are passing away," there have never been lacking prophets of despair to picture in somber colors the impending decline of the New England States in political and economic influence as well as in moral and intellectual leadership. Only two or three years ago, indeed, so authoritative a body as the Boston Chamber of Commerce put itself on record as believing that the development of this section of the country has too nearly reached its limit to warrant the adoption of an ambitious plan of railroad construction and operation. To the Texan, the Californian, the Iowan, the New Yorker even, who is troubled by never the shadow of a doubt concerning the future of *his* corner of the universe, such an attitude is next to incomprehensible. It stamps New England at a stroke as hopelessly effete.

But of course the matter is far too complicated for any such snap judgment. In the first place, strange as it may seem, the real New England is less generally known to the people of the United States than is any other considerable section of the country. In the second place, questions of progressiveness and decadence are purely relative and are next to impossible to handle quantitatively. And

in the third place, the prophesyings of Cassandra have never gone unchallenged by New Englanders, who all but unanimously cherish a faith in the future of their section not less solid, even if somewhat less exuberant, than the respective attachments of the Texan or the Californian.

The first big fact to be conceded is that, in proportion to the remainder of the country, New England *is* less important now than in earlier days, and for two principal reasons: (1) The enormous growth of the country itself in area and population, and (2) the diffusion of learning and the arts, whereby, so far as the instruments of civilization go, the whole country has been put upon pretty much the same basis as that occupied exclusively by the seaboard States a hundred years ago. The Elbridge Gerrys and the Josiah Quincys were quite right in predicting the overbalancing of New England by the great West. The mere fact that the section which once comprised nearly a third of the States now comprises only a seventh means a loss of weight. But, obviously, this relative falling off, in which every older section must share because of the very existence of the newer ones, is of only the most superficial significance. It denotes nothing whatever as to the future of New England or of any other section as a region within itself. Admitting that the New England States are not so big nor so essential a part of the nation as once they were, the question yet remains as to whether the region is therefore doomed to positive decadence.

The future of New England, as of any other portion of the country, is, in the last analysis, a question of men and resources. So far as men go, it does not appear that there is ever likely to be a dearth. There was a time when the population of the New England States was almost stationary, but that was in the days of the great migration to the West and before recruiting from foreign sources had set in on its present scale. Contrary to what many people imagine, the population of New England is today increasing at rather more than a normal rate. Massachusetts and Rhode Island continue to be much more densely peopled than any other of the States, while in this respect Connecticut is surpassed only by New Jersey, and even Maine, New Hampshire and Vermont take rank, respectively, with Minnesota, Missouri and Iowa. A very considerable proportion of the increase, it is true, arises from the immigration of Italians, Jews and Irish; but the same must be said of other sections of the country, and it remains to be demonstrated that the alien influx is a permanent and inevitable drawback anywhere.

On the side of resources, the future of New England, as indeed of the country at large, is a question simply of conservation and utilization. The resources are perfectly adequate for a densely populated, highly developed and powerfully influential section of the United States for untold generations to come. Take first what look to be the least promising —the agricultural. In 1900 the six New England States contained 191,888 farms, aggregating 20,548,999 acres—approximately the farming acreage of Indiana or of Alabama. Of this acreage only about 40 per cent. was reported as "improved." Obviously New England was, and is, very far from agricultural preponderance. It has never fed its own people, and never will. Yet its products of the soil are by no means inconsequential, and indeed they are quite sufficient to give the region a distinct advantage over any other predominantly commercial and industrial region that the world has known. The potato crop of Maine in 1907 was surpassed by that of only four States. The hay crop of Maine and Vermont together in the same year was exceeded by that of only six States. And the tobacco crop of Connecticut was excelled by that of only seven. The total value of the agricultural produce of Massachusetts in 1895 was $53,000,000. In 1905 it was $64,000,000, a gain of 21.03 per cent. The scientists assure us that we are inevitably approaching an age of intensive farming. In such an age it would appear that New England will be at a relatively smaller disadvantage agriculturally than at any time since the opening of the great West. For there can be no question that considerable portions of the section are capable of almost indefinite productivity under the stimulus of scientific methods.

Much has been written in recent years about the depopulation of the hill country of Massachusetts, New Hampshire and Vermont, and about the tendencies to degeneration observable among the population that remains. That there was a decline in the rural population of large sections during the past generation is indisputable. From all indications, however, the pendulum is now swinging in the opposite direction. We have lately been assured that a fairly stable balance between country and city population in the United States seems at last to have been reached—that, at any rate, the feverish and abnormal flow of men and women to the cities, which has agitated reformers for a generation, has been reduced to more wholesome proportions. However this may be for the country at large, there can be little doubt of it in New England. There is going on in this section today a rapid re-occupation of the so-called neglected and "abandoned" farms. Until 1903 the Massachusetts Board of Agriculture issued annually for many years a descriptive catalog of such farms within the limits of the State, but the publication has been discontinued for the sole reason that the properties advertised have been so largely taken up that such an expedient of publicity is no longer required. There are in Massachusetts today really very few farms without more or less energetic proprietors. This has come about thru the acquisition of rural holdings by three classes of people. In the first place, there are the city folk in quest of summer residences—not only Bostonians and New Yorkers, but also residents of many smaller centers and cities farther removed. These buy up well located farms, improve them, live upon them during the summer months, and not infrequently have tenants who care for them the year round and maintain them as permanent and well ordered agricultural establishments. Under the agency of the Board of Agriculture of New Hampshire more than 4,000 farms have been sold for summer homes in that State alone. In the second place, there are the people—sometimes from the city and sometimes from other portions of the country—who are seeking inexpensive lands for permanent occupancy and cultivation. Hundreds such have been added in recent years to the depleted populations of the hill towns. Finally, there are the aliens—generally Swedes or Poles, but not a few Italians—who are fast becoming small independent farmers on lands they have bought with their earnings as farmhands.

A case comes to mind which very well illustrates the process by which rural New England is becoming repopulated and regenerated. Five miles west of the picturesque little Massachusetts town of Chester, on the Boston & Albany Railroad, is a farm of forty acres, with an excellent dwelling house and all the ordinary rural improvements. Ten years ago the whole outfit rented for the munificent sum of $30 a year. A gentleman living in New Haven found himself physically incapacitated for his career as a chemist, and, looking about for a chance to combine recreation with the supporting of his large family, stumbled upon this little backwoods farm. He bought it, established himself upon it, and set to work to fertilize it and bring it to its capacity of productiveness. In two years' time he had it supplying every reasonable want of his family and was laying up an annual surplus of $600 from the sale of unused produce. The leaven of such an achievement worked in the community, and today every farm adjoining Mr. A's is in an unprecedentedly high state of productivity. What this man has done hundreds of others are doing and thousands may do. Somewhat over a year ago the dean of the agricultural college of an important Western State university, being on the point of retirement from active service, purchased a farm near Glastonbury, Conn., for no other reason than that he believed he could combine scientific agriculture and agreeable living conditions in New England as nowhere else. "Western methods in New England," he declared, "will bring results in both money and crops that no other part of the country can equal. A lot of New England cannot be farmed, but a lot of it is fine farming country, and the markets surpass anything you can find elsewhere. The trouble with the New England farmer is that he is timid, afraid to

to new methods and machinery, afraid to plant a large acreage." Such an example and such expert testimony are doing much to engender a fresh optimism among New England farmers, as well as to stimulate the introduction of outside capital and enterprise. The enormous town and city population of the region must be fed; foodstuffs cannot be wholly imported; and there you have the fundamental reason why farming in New England can be made to pay, and pay as well, indeed, acre for acre, as in any part of the United States.

But, of course, agriculture in the New England States must always be quite subsidiary to the two great dominating interests of manufacture and trade. In manufacture New England has two enormous advantages over the rest of the country, *i. e.*, an untold wealth of water power and an almost unlimited supply of efficient labor. Her one great disadvantage is her dependence upon outside sources for raw materials; but this is an obstacle which has never proved insuperable, and, with due attention to transportation improvements, it can be counted upon not to do so. Industrially, the New England of today is more than holding her own. There is but a single branch of manufacture in which there has been noteworthy decadence. That is the making of low-grade cotton goods, which has ceased to be profitable anywhere except in the South. As for all high-grade cottons, the indications are that New England manufacturers will be abundantly able to meet any competition the South can offer. What has happened is that Lowell and other great centers for the manufacture of cheap cottons have simply gone over to the production of the superior grades and have begun to compete with the makers of the delicate and artistic fabrics of France. The total value of cotton goods manufactured in New England in 1900 was more than $191,500,000—an increase of nearly 250 per cent. since 1860. In Massachusetts the gain from 1900 to 1904 was nearly 20 per cent. The combined textile industry in Massachusetts in 1900 represented 34.6 per cent. of the manufacturing capital of the State, 32.5 per cent. of the number of wage-earners, and 24.1 per cent. of the value of all manufactured products. By the census of 1905 it appeared that in the interim there had been an increase in capital of $58,592,454 (21.3 per cent.) in wage-earners, of 8,150 (5.4 per cent.); and in value of product, of $55,240,875 (25.6 per cent.). Lowell, Lawrence and Fall River easily remain America's foremost textile centers. In similar fashion Lynn, Brockton and Haverhill continue the premier boot and shoe cities, not only of America, but of the world. Other branches of manufacture are well to the fore. In 1905 Massachusetts was first among the States in the production not only of cottons, woolens, worsteds, and boots and shoes, but also of rubber goods and stationery and book paper. She was second in the manufacture of leather and leather goods, and of cordage and twine, and third in the manufacture of jewelry and in the output of foundries and machine shops. Her 30,000 manufacturing establishments gave employment to 500,000 wage-earners and turned out products to the annual value of $1,000,000,000—an increase of more than 50 per cent. in ten years. As a manufacturing State she was surpassed by only three in the Union.

There is absolutely no reason why Yankee intelligence and thrift should not make New England far greater industrially in the next fifty years than she is today. It is the universal feeling of representative men thruout the section that the possibilities have only begun to be realized. New England has one mighty resource whose value is bound to grow as time goes on—that of water power. Some years ago Dr. Charles P. Steinmetz, consulting engineer of the General Electric Company, declared to a New York audience that the supply of coal would be exhausted within the life of the present generation, or that at least it would be reduced to such a point that the cost of production must make its use impracticable as a general means of obtaining power and heat. But, of course, light, power and heat are going to be increasing necessities of civilization. The possibilities of wood and oil as substitutes for coal are obviously limited and the conclusion is inevitable that the vastly increased use

of electricity is to be the only solution. Electricity, however, is only a transformed energy, behind which there must be power. The only power available will be that which Dr. Steinmetz pointed out as the hope of the future, *i. e.*, the practically inexhaustible energy afforded by the rivers and waterfalls of the country. New England is America's richest storehouse of such power, and it is reasonable to suppose that, even if the grinding necessity does not come so soon as some predict, the gradual exhaustion of cheap fuel will compel a more sweeping localization of industries in the vicinity of the New England rivers than has yet been dreamed of.

Hand in hand with this stimulus to manufactures, too, must go a quickening of New England commerce. There are those who believe that, commercially, New England has seen her best days. They point to the fact that the big items in the foreign trade of the country are the agricultural exports of the Middle West and South, which start for Europe more readily *via* New York, Philadelphia, Baltimore, Newport News, New Orleans or Galveston than *via* Boston, and the imports from Europe for the consumption of the North and East, which come in with peculiar facility at the port of New York, but are also rapidly increasing at other Atlantic points outside of New England. On these grounds it is not infrequently represented that with the further development of rival avenues the foreign traffic of New England may be expected to dwindle. Herein, it must be confest, lies a chance for an argument. Undoubtedly the most critical question now confronting New England relates to the future of her European commerce, the immediate issue being the betterment of her railroad and terminal facilities. But two things it is important to observe. The first is that after decades of competition, much of the time on the disadvantageous terms imposed by railway differentials in favor of South Atlantic ports, Boston has steadily maintained a place of commanding importance in the European trade. After being temporarily ousted by New Orleans, she is again in second place in the race for supremacy, with a lead, in 1907, of $18,321,090 over New Orleans, $40,399,913 over Philadelphia, and $101,430,412 over Baltimore. Her foreign commerce in 1907 was 9 per cent. greater than in 1906, which in turn was the banner year in her commercial history. Philadelphia and Baltimore alone made larger gains. The second thing to be observed is that, while the control of a goodly share of the traffic between the West and Europe is eminently desirable, it is not absolutely essential to the healthy commercial prosperity of New England as a section. Here as nowhere else must manufactures increasingly preserve the channels of trade from stagnation. Exports must, in any case, be considerable; while the numbers and wealth of her people can be counted on to maintain a lively demand for the products of other portions of the United States, and of the most distant parts of the world.

Outsiders—and some insiders—find New England provincial. To a Westerner the conservatism and complacency of many people he encounters will at times be amusing, possibly irritating. To many these qualities seem the sure denial of progress. To others, however, they appeal as the finest fruits of century-long thrift, discipline and integrity; and, on the whole, it would seem a fair conclusion that, given the physical conditions under which the New Englander has wrought for upwards of three centuries, it is principally these very qualities of stability that have brought him his remarkable dominance in the arts and crafts and in the finer aspects of our modern civilization. Wholesomely infused with twentieth century enterprise and optimism, they may be trusted to carry him thru a prosperous and honorable future.

# Literature

## Local Romance

To render in fiction the familiar events of life truthfully and yet acceptably is one of the highest forms of literary art. Exactly what, however, makes truth about anything acceptable is a question as prolific of argument as "The Lady or the Tiger." We have just been passing thru a period of veritistic fiction, mostly fiction dealing with problems and grievances, wherein we have been forced to see the skeletons in our own and our neighbor's closets because our novelists persisted that it was better to be warned by fact than protected by illusion. But most of us are unpleasantly cognizant of truth unadorned and consequently after we have suffered the first shock of its sensational exposure indulgence in literary scandals palls upon us. What we desire is truth masquerading as romance. The weathercock of romance is locality and recent novels mark the shifting of fiction to those localities commonly characterized as romantic — Europe, the South and the West. Few of the books reviewed here have the virtue of newness. Their value lies not in what they say but in their emancipation from the inelastic environment of the East where the scenes of so many of the late problem novels have been laid.

Europe is the costumer for all romantic figures of tragedy and love. To the former she can offer the complications of poverty and of passion, and to the latter scenery and many a choice ornament of beloved historical legend. *Seekers All*,[1] *Account Rendered*,[2] and *Fortunata*[3] are stories of the pursuit of fortune by poverty-stricken Europeans. In *Seekers All* the heiress escapes and marries happily—happiness being the goal according to the author of all human search. In *Account Rendered* the heiress does not escape and all concerned suffer the consequences of an ill-matched marriage. Both books have their scenes in England and most of their ingenuity in their titles. *Fortunata* is Italian and therefore, according to the usual causes governing the presentation of Latin romances, melodramatic, vehement and tragic. Fortunata, the daughter of a poor but noble Italian house, marries a rich Englishman only to find that the gambling spirit of a hitherto uncertain livelihood had unfitted her for the monotony of comfort. The book is luridly conceived and written but it betrays a poetic and visual quality of description which marks it as distinctive.

We had believed that the "tawny," "tigerish" woman with the pale, quiet daughter had passed from fiction some three or four years previous, but phœnix-like she arises from the ashes of many disreputable novels and reappears in the *Panther's Cub*.[4] The scenes are variously on the Continent and in England. It is to be regretted that the facile authors of this book should have chosen so tawdry a tragedy of passion as a demi-monde prima donna jealous of her young daughter. We hope that when the hygiene of fiction is developed, such dust-hole conceptions of romance will be disinfected. Romance as affected by locality is most emphatically evident in *Forged in Strong Fires*[5] and *The Golden Silence*.[6] The former has its scenes in Africa during the time of the Boer War. The fact that the civilization there is but grafted on and tentative—that up in the hills the mysteries of savagery shroud its black inhabitants, reflects a shadow of dark potentiality over the whole country of Boers and English and gives to the thin thread of this story a certain strength disproportionate to its real quality. *The Golden Silence* belongs to the Hichens desert school. It is an account of the search of a girl for her sister, who married an Arab and then

[1] SEEKERS ALL. *By Mrs. Kenneth Combe.* New York: Hodder & Stoughton. $1.20.

[2] ACCOUNT RENDERED. *By E. F. Benson.* New York: Doubleday, Page & Co. $1.35.

[3] FORTUNATA. *By Majorie Patterson.* New York and London: Harper & Bros. $1.30.

[4] PANTHER'S CUB. *By Agnes and Egerton Castle.* New York: Doubleday, Page & Co. $1.35.

[5] FORGED IN STRONG FIRES. *By John Ironside.* Boston: Little, Brown & Co. $1.25.

[6] THE GOLDEN SILENCE. *By C. N. and A. M. Williamson.* New York: Doubleday, Page & Co. $1.35

disappeared into the silence of a harem. The originality of the book lies in its morality. Mr. Hichens, the head of this school, has not succeeded in making the desert and morality compatible. These authors accomplish the feat with difficulty. *The Unknown Lady*[7] belongs to the mystic class of Kipling's "Brushwood Boy." Mr. Forman's hero from childhood up has a dream lady who finally materializes or at least so he believes. The fact is he falls in love with one whom he meets in Paris, and so, for the sake of justification, he identifies his reality with his dream. The identification is not strong enough to endure a few months of marriage and so the woman commits suicide rather than deprive the man of his illusion. The story is wraith-like and disjointed. To Mr. Hewlett and to Mr. McCarthy seem to belong the favors of having written so far the purest romances of the season. *The King Over the Water*[8] is a swashbuckling story of the abduction of a Princess by four intrepid subjects of James of Scotland. The scenes of it are on the Continent. Like all of Mr. McCarthy's stories the style of this is graceful and ingenious in the impudent bravery of its four heroes.

The romance of the South bids fair never to change the quaint garb put upon it some forty odd years ago and which it still wears as gracefully as if courtly old colonels and quixotic sentiment had not long since gone out of style. *The Colonel's Story*,[9] with its scenes in Virginia, is as fragrantly romantic as the roses that bloom in the gardens of the story. It is a pleasantly written tale of Southern hospitality and faithful love. The reader will recognize *Colonel Todhunter of Missouri*[10] as belonging to the mirage class of stories—all atmosphere and nothing when you arrive. Hospitality, politics, and a pronounced Southern dialect create this particular mirage. *The Purchase Price*[11] is another Missouri story of the period just before the war. With a beautiful foreign Countess who proves to be a dangerous abolitionist, and a "Jane Eyre" surplus of wives the hero finds himself amid too many complications to be as gallantly Southern as he might otherwise be.

The Western novel still remains in its six-shooter, bunco-buster position in fiction. To read stories from that section is like meeting twins. The hero of one may have dark hair, of another light. They may each have a different kind of "bad man." But if they all were stripped of their physical characteristics, they would be undistinguishable save for their more individual and temperamental cayuses. The interest of them all depends upon much the same thing—liquor, sheep, horse-stealing, rustling, and shooting. Love enters but incidentally into such stories. *The Invaders*[12] and *The Range Riders*,[13] the latter a collection of short stories, both relate to the persecution of rustlers in those great grazing lands where farming and breaking the range are misdemeanors summarily dealt with. *Bar 20 Days*[14] is another collection of stories in which the participants shift from the saloon to the saddle and from the saddle to violent death in a grim circle which seems to characterize the majority of these Western stories. *Hidden Water*[15] is an account of the desperate struggles of the cattlemen against the increasing inroads of sheep upon their grazing lands. The story is somber and fierce but is so dramatic as to distinguish it among this group of novels. *A Breath of Prairie*[16] is a collection of stories too much tarnished by the problems of the East and the Middle West to belong in this class of swaggering, sombrero romances. The collection as a whole in atmosphere and conditions is infinitely sad and drab. The picture of Western farm life suggests some of Hamlin Garland's gray prints of the same country. *The Land Claim-*

[7] *The Unknown Lady*. By Jessie Mott Forman. New York: Harper & Bros. $1.50.

[8] *The King Over the Water*. By Justin Huntly McCarthy. New York: Dodge Pub. Co. $1.50.

[9] *The Colonel's Story*. By Alice Ross Colyar. Boston: The Page Co. $1.50.

[10] *Colonel Todhunter of Missouri*. By Peter B. Kyne. New York: The Macmillan Company. $1.50.

[11] *The Purchase Price*. By Porter Emerson Browne. Indianapolis: The Bobbs-Merrill Co. $1.25.

[12] *The Invaders*. By Emerson Hough. Indianapolis: The Bobbs-Merrill Company. $1.25.

[13] *The Range Riders*. By Charles Alden Seltzer. New York: Outing Publishing Co. $1.25.

[14] *Bar 20 Days*. By Clarence E. Mulford. Chicago: A. C. McClurg & Co. $1.25.

[15] *Hidden Water*. By Dane Coolidge. Chicago: A. C. McClurg & Co. $1.25.

[16] *A Breath of Prairie*. By Hall Gilbodge. Chicago: A. C. McClurg & Co. $1.50.

[17] *The Land Claimers*. By John Fleming Wilson. Boston: Little, Brown & Co. $1.50.

... is a sort of Martin Chuzzlewit experience of a man who found his claim in the Oregon forests to be as valueless as Martin found his Eden. Two other stories of the Northwest are *The Honor of the Big Snows*[18] and *Two on the Trail*.[19] The former is the story of a girl's life in a Hudson Bay camp. It touches particularly upon the moral aspect of life in the great North where one can hide from the past so completely that one is tempted to take up the skein of another existence in spite of the previous obligation in the distasteful past. *Two on the Trail* is the story of a young woman who goes in search of an erring husband only to find him a sodden wreck with a squaw wife. Such a story has no virtue save that of being adventurous. And such adventures as these leave only the unpleasant picture of disgrace and sorrow. The chief distinction of *Mc—Smith*[20] is the arrogance of its title. It strikes the resonant savage note characteristic of these novels, and in it cattle-stealing, lying and murder reach their hight.

But the reader will say, has romance fallen into such disrepute that such stories mark a return to it? Perhaps after all, the reviewer is like the Scotchman who never concedes that a sick man is any better but may admit that he is "nae waur." Certainly a great number of these stories are poor representatives of romance, but they are no worse than they have been in the past. A gallant knight with a ready sword at his side, a Southern beauty with a rose in her hair, and a belligerent cowboy on a bucking pony may not impossibly be the precursors of pure romance some years hence.

**Unconscious Memory. Life and Habit.** By Samuel Butler. New York: E. P. Dutton & Co. $1. 50 each.

The chief value of the first volume lies in the introduction in which Prof. Marcus Hartog gives an account of the present tendency of biological thought to develop some form of vitalistic theory or purposive evolution as a substitute for the mechanistic theory that has been dominant. Butler's own views on this subject, altho they are anticipatory of later thought, were ignored when they appeared and are hardly worth reviving now, for he did not have a scientific mind, as is shown very plainly in this volume. He evidently could not see the difference between the work of Charles Darwin and the speculations of earlier evolutionists, so he makes a series of petty and petulant attacks on Darwin for going to nature instead of books for his ideas. A third of a century has past since *Life and Habit* was written and this period has been busy with the experimental study of heredity, memory, instinct and neurology, so these speculations upon chance—collected and insufficient data, characteristic of the time, seem now strangely antiquated, even tho they are in some respects more in accord with the temper of our day than Darwin's.

**England and the French Revolution.** By W. T. Laprade. Baltimore: Johns Hopkins Press. $1.

It is not often that a doctor's dissertation arouses any considerable enthusiasm on the part of a hardened reviewer of books, but Dr. Laprade has handled an engaging theme—*England and the French Revolution*—with a skill that is rarely found in such a heavily documented work. The central problem of his attack is the extent to which the popular agitations in England from 1789 to 1797 were due to revolutionary influences emanating from France; and his answer to this question is that the uprising across the Channel played a minor role in the domestic policy of England during those years, "except so far as it was used by Pitt and his colleagues for their own political purposes as a pretext for reviving the old time struggle with France for supremacy in the commercial and colonial world." This conclusion does not appear to have been read into the voluminous—one might say stupenduous—mass of eighteenth century literature upon which the dissertation rests, but seems to have grown naturally out of a search for the essential forces at work in a complex and contentious period. The volume is therefore an illuminating study of William Pitt and the pressing

[18] THE HONOR OF THE BIG SNOWS. *By James Oliver Curwood.* Indianapolis: The Bobbs-Merrill Co. $1.25.
[19] TWO ON THE TRAIL. *By Hulbert Footner.* New York: Doubleday, Page & Co. $1.20.
[20] MC SMITH. *By Caroline Lockhart.* Philadelphia: J. B. Lippincott Co. $1.20.

economic interests which functioned thru his government. It is, therefore, a useful contribution to the slowly growing literature available for that scholar who will do us the service of writing the economic foundations of English political history. Incidentally Dr. Laprade discusses many old themes—such, for example, as the Price-Burke-Paine controversy — and Burke, that shallow sophist who is esteemed a philosopher by those who have not read him, is placed in his proper light setting as a pompous and venemous political pamphleteer. One of Burke's letters, turned up by Dr. Laprade, shows the real spirit of the man. Writing of his "Reflections on the French Revolution," he said of his opponents: "I mean to set in full view the danger from their wicked principles and their black hearts . . . I mean to do my best to expose them to the hatred, ridicule, and contempt of the whole world, as I shall always expose such calumniators, hypocrites, sowers of sedition and approvers of murder and all its triumphs" (p. 19). In this private letter we find the true spirit which actuated the "philosopher" in most of his great undertakings, but when he spoke "for publication," he assumed the guise of the deep-penetrating seeker after truth.

**Social Basis of Religion.** By Simon N. Patten, Ph. D., LL. D., 16mo, pp. xvii, 247. New York: The Macmillan Co. $1.25

It is not strange that a student of political economy, like Professor Patten, should turn aside to discuss religion, for religion has had much to do with the body politic. The author, in this interesting and suggestive volume, has the purpose to take religion out of its dogmatic and theologic side and bring it to bear on the social problems of the day. He has much to say of natural religion, by which he does not mean anything doctrinal, but the spontaneous outlook, or uplook, of the comfortable and happy primitive man; while ecclesiastical and established religion has grown up under conditions of degeneration caused by famine, drought and war, the great curses of so large a part of the world. Thus religion has been too much marred by what has sought to fit it to conditions of fear instead of conditions of peace and plenty. One may raise the question whether he is historically correct, whether there ever was such a period in the dawn of humanity, a golden age in which men expected to live to be a hundred or a hundred and fifty years old; and one may question what kind of a religion grew up in such a land of happy and contented savages, but there is no doubt that war and disease and disaster have greatly shortened life, and that now the period of life is lengthening. Such lengthening the author expects. This, with the increase of wealth for the community, is to be a chief purpose of the socialization of religion. Under such a new economy we may expect a truer socialized idea of God, one more like that of Jesus in his teachings, and less like that which Paul based on his death. This service for the social order Professor Patten strongly presents and urges, that the degeneration may be arrested and overcome. There is not in his presentation of religion anything mystic; it is wholly practical and looks to a reversal towards that condition of peace, joy, abundance and longevity which may, unlike the primal condition, be consistent with civilization and abundant population.

**Edgehill Essays.** By Adrian Hoffman Joline. Boston: Richard G. Badger. $2.

**The New Criticism.** By J. E. Spingarn. New York: The Columbia University Press. 75 cents.

Even book reviewers have their whims and it is ours to range together on our writing table two volumes that have little in common except the date on the title page. Mr. Spingarn writes 35 pages; Mr. Joline, 226. Mr. Spingarn addresses us from the lecture platform; Mr. Joline talks to us from the depths of an armchair, where he is all imbedded among his beloved books. He quotes these liberally—and for no reason other than because he chooses to do so. He talks about his favorites on his bookshelves, to which he points from his easy chair with his paper-cutter; about collecting autographs, about two eighteenth century authors no longer—if ever—to be ranked among "best sellers." Only in his two concluding essays

does he discuss what spectacled persons such as take life drearily call "modern problems." With grace of style and a kindliness of spirit that sometimes gives way to an asperity that does not wound any one very deeply, Mr. Joline proves good company for those of us who have not forgotten how to read essays. He does not think the dilettante such a dreadful person as Americans in general pretend to, and will not be greatly grieved if you call him one. He rebukes Stevenson for observing that "books are good enough in their own way, but they are a mighty bloodless substitute for life." He considers that a good deal like saying that strawberries are a poor substitute for beef.——As for Mr. Spingarn, whom we had almost forgotten, his little volume is really a lecture delivered at Columbia University last spring, and is well worth reading by any one who cares for having a bird's eye view of that obsolescent genre called criticism. "What droll creatures these college professors are whenever they talk about art," he quotes from Flaubert, by way of introduction. Yet we do not find Professor Spingarn droll—or dull. We recommend his *New Criticism* to every one who wishes THE INDEPENDENT printed more book notices, and likewise to any one who wishes none were published at all.

**Clever Hans.** A contribution to experimental animal and human psychology. By Oskar Pfungst. Trans. by Carl L. Rahn. New York: Henry Holt & Co. $1.50.

There is something fine about German thoroness in spite of the fun we sometimes make of it. Here is a volume of 250 pages with a bibliography of 124 titles devoted to *Der Kluge Hans,* the "learned horse" which made such a sensation in Berlin six years ago. Hans was able to give the answer by taps of his foot to complex arithmetical problems, to pick out colors, to spell words and distinguish musical notes. Mr. Pfungst and other scientists made a careful investigation of the case and discovered that the alleged cleverness of the horse was a myth. He had really been guided in his answers by minute and involuntary movements of the questioner, chiefly a slight throwing up of the head at the end of a count. He could not answer unless the questioner was in sight and knew the answer. The explanation is therefore the same as of mind reading, telepathy, table-tipping and planchette-writing. The owner had really been training himself to give the signals in the years that he had devoted to the training of the horse, but he was doubtless sincere in his fanatical belief in the extent of horse sense, as is shown by his willingness to submit to the investigation and his surprise and incredulity at the result. The controversy over the case involved as usual in Germany, philosophy, theology and science in addition to animal psychology.

## Literary Notes

....A racing romance is *Stanton Wins,* by Eleanor Ingram (Bobbs-Merrill; $1), with a driver as swift in love-making as he is in his machine and a heroine who is a match for him.

....Those desiring a fair and wholesome exposition and criticism of Christian Science and new thought movements would do well to consult the brief but reliable volume by Leon C. Prince, entitled *The Sense and Nonsense of Christian Science* (Badger; $1).

....Jack London's forty-foot boat, the "Snark," did not go round the world, but its voyage among the Pacific islands afforded its skipper plenty of good copy and he protests that he enjoyed it in spite of his affliction by unique tropical diseases (*The Cruise of the "Snark,"* Macmillan; $2).

....Last September we noted the publication of a volume of text and pictures, some of them in color, entitled *The Mountain That Was God,* by John H. Williams (THE INDEPENDENT, lxix, 596). We now receive a copy of the same attractive volume bearing the imprint of G. P. Putnam's Sons (75 cents).

....For the summer cuisine, when meats are less attractive to the family, a little cook book by Jeanne Jardine, *The Best Vegetarian Dishes I Know* (Dutton; 50 cents), will be helpful to the perplexed cook or housewife who must arrange hot-weather menus. One hundred and seven recipes give room for choice and for varied vegetarian fare.

....Among the feather-weight fiction suitable for midsummer wear, we find an insubstantial novel, *Miss Billy,* by Eleanor H. Porter (Page; $1.25), which gives a mildly

amusing account of the upheaval of the home occupied by three bachelors, by the arrival of a sixteen-year-old schoolgirl, whom they had mistaken for a boy because of her masculine signature.

....Another volume of essays by J. Brierley, the accomplished London writer on moral and religious topics, will be welcomed by his many readers and admirers in America. Each chapter is characterized by that largeness of vision and sincerity of presentation which make Mr. Brierley's books so full of inspiration and suggestion. The essays all deal with some of the various aspects of *Life and the Ideal.* (Pilgrim Press; $1.25.)

....One of the most informing and suggestive books in its special field is the little volume on *Church Work With Boys* (Pilgrim Press; 50 cents), by William Byron Forbush. Its discussions of the boy's stages of development, the "gang" spirit, and the means of recreation and social adjustment are admirable. The select bibliography appended will furnish wise guidance to any one desiring to pursue further some particular phase of the subject.

....The new art of flying is rapidly developing a literature of its own. *How It Flies,* by Richard Ferris (Nelson; $1.20), is a comprehensive and well illustrated volume for the general reader, comprising description and history of both balloons and aeroplanes, with a glossary and a chronicle of records to the end of 1910. *The Principles and Design of Aeroplanes,* by Herbert Chatley (Van Nostrand; 50 cents), is a smaller and more technical work, giving formulas for instruction and much practical advice in condensed form.

....There has been some discussion in regard to the attitude of the Russian Government toward the publication of Tolstoy's works. A dispatch to the Paris *Temps* states that the present attitude of the Government is, in this affair, thoroly liberal. The favorite daughter of the great Russian, deputed by her father to supervise the publication of his manuscripts, has been informed that the Government will authorize the publication of all his works, both those already known and those not previously made public. The only exception is that the religious and social studies of Tolstoy, hitherto suppressed in Russia, may appear only in the complete edition and must not be issued as tracts.

An attractive little pamphlet is that issued by the Free Public Library of Newark, N. J. Its title-page is as follows: *Reading for Pleasure and Profit.* "A list of certain books which young people find entertaining. Some books which older readers enjoyed when they were young." It has always been a problem what children should read—if they should read at all—while on their summer vacation. Dr. Dana, Newark's librarian, is of the opinion that pupils might "pleasantly and easily" prepare themselves for "next term's work in English," by following the list compiled by his assistants. We are receiving a multitude of "recommended readings," but this seems to us neither heavy nor serious, yet zealously observant of the best in literature. It strives only to satisfy the requirements of a high school course in English.

## Pebbles

THE VILLAGE FROG.

Under the lily pads and things
  The big old bullfrog squats;
His greenish hide is thick, b'jings.
  With warts, and lumps, and knots,
And when he swells himself and sings
  His voice is rough in spots.

His thighs are thick, and big, and strong;
  Yet he enjoys his ease;
And when the echoes of his song
  Are borne upon the breeze,
His normal slope, unless I'm wrong,
  Is forty-five degrees.

Week in, week out, from morn till night,
  You can hear his bellows blow;
You can hear him sound his gong, all right,
  With measured beat and slow,
Like a bruiser spoiling for a fight
  When there isn't any foe.

On Sundays come the village boys,
  With fishing poles, red rags,
And sticks, and stones; and then his voice
  Mysteriously lags.
He hides himself—he has no choice—
  Down deep amid the flags.

Squatting, hiding, bellowing,
  Onward through life he goes;
He eats a little, tries to sing,
  And warbles through his nose.
He doesn't have to do a thing
  To earn a night's repose.

Thanks, thanks to thee, my warty friend,
  For the lesson thou hast taught!
Thus, in the great frogpond of life,
  Our fortunes must be wrought;
There's nothing else on earth to do
  But keep from getting caught!

*Chicago Tribune*

Beneath the spreading mistletoe the village smithy stands,
His sweetheart right beside him, takes in hers his horny hands.
He leaves her and kisses her—Oh! what a lovely sight!
Says she, "Hold on there, Jack." Says he, "I am with all my might."

*Columbia Jester*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra. To Canada, $1.00 extra. Subscriptions will be received for other periodicals, and club-bing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

THE semi-annual index of THE INDEPENDENT for the last six months is now ready. Subscribers may obtain a copy free of charge by sending us the request on a postcard.

## The Partition of Morocco

THE reason why the arrival of a German gunboat at the little town of Agadir has upset the stock markets of the world and started rumors of war is because it portends the breaking up of Morocco, almost the last bit of African territory remaining under native rule. Germany was not around when the other European Powers were staking out their claims on the uncivilized lands all over the world. She did not awake to the importance of colonies until it was almost too late to get them. All she could do was to pick up a few pieces of land in Africa that the others had not thought worth taking, to seize a part from China, and to scheme for a controlling interest in Asiatic Turkey.

Morocco had been ear-marked by France and was apparently destined to succumb in due time to the "policy of peaceful penetration" adopted by that country. Spain seemed unambitious and quite content with the five points on the Moroccan coast which she had retained to make sure that the Moors did not return when they were driven out of Europe.

The only Power which might be expected to object to the absorption of Morocco by the French was Great Britain. It was indeed held by many prominent Englishmen that it would be criminal to allow France to get a country so vital to safety of the Empire, for one side of the Strait of Gibraltar was as important as the other, especially now that guns are big enough to shoot across. But the British Government persisted in its friendly policy toward France, and by the agreement of 1904 each country left the other free to pursue her several aims in Africa, without interference or protest from the other; Great Britain to do what she liked in Egypt and France to do what she liked in Morocco.

Both countries, in fact, entered Africa under false pretenses. In 1832 the Government of Louis Philippe assured England that France had no intention of holding Algeria. Nevertheless, Algeria is now, not a colony, but a part of France, with representatives in the National Assembly. Later England consented to the possession of Algeria on the promise that France would not annex Tunis on the east or Morocco on the west. On the other hand, England has repeatedly declared that the occupation of Egypt was only temporary, and indeed that pretense has not yet been officially dropped.

The crisis between France and Great Britain was reached and peacefully passed in 1898, when Lord Kitchener of Khartum, fresh from his victory at Omdurman, journeyed on up the Nile, and at Fashoda came across M. Marchand and eight other Frenchmen who had entered the Sudan by the back door, having spent two years in making their way thru the heart of the dark continent from the French Kongo. But Lord Kitchener informed him emphatically that England would never permit the French flag to fly there, and hoisted the flag of the Khedive in its stead. France, after much excitement, acquiesced, and thus was

settled the eastern limit of the French possessions in Africa.

But there was no impediment to expansion over the rest of northern Africa, and France has diligently improved the opportunity. The success of the French in exploration, administration and civilization during the last generation is wonderful, and all the more surprising when we consider that it is due to the Government, not to the expansion of population and the initiative of individuals and corporations, as in the case of England.

The territory acquired is more than ten times the area of France, and every other Frenchman is now an African.

Gradually the French lines have been drawing closer about the only corner lot still in the market, Morocco. On the south, Morocco has no boundary but the Sahara and the Sahara is French. The tribes in the northern part of Senegal have for two years been gathered into a French protectorate under the name of Mauretania. On the east the elastic Algerian frontier has been pushed back as far as possible and then overstepped. Ujda has been occupied by a French garrison for three years, very much to the advantage of that part of the country, as even the Germans admit. Within the last few months another advance has been made to Taurirt and a French army is now encamped on the Muluya River, impatiently waiting for permission to march to Toza, which commands the high road to Fez. On the western side Casablanca and Rabat were seized in 1908. Last month an expedition left the latter post for "the relief" of Fez and Mekinez, which were duly occupied by French troops, tho whether they were relieved or not by the process we can only surmise.

And now Spain gets excited over the fact that her last chance of increasing her African holdings is slipping away, so she plunges in and seizes Larache and Alkazar, and extends her boundaries about Melilla and Ceuta.

Last of all comes Germany and picks on the southern coast of Morocco

as a good point for a colony or at least a coaling station. It is within easy reach of Brazil, for one thing, and for another it commands the British ocean routes to South Africa, India and Australia. To be sure, this "Panther" is merely calling at Agadir to protect German merchants, altho the outside world had not heard that there were any German merchants there endangered. And did not Chancellor von Bülow declare to the Reichstag and to the world April 5, 1906, that Germany had no political interests in Morocco, no political aspirations, and no desire to set foot on Moroccan soil, because that would weaken rather than strengthen her position. But this language reminds us too much of what England said about Egypt and the Sudan, and France about Algeria and Tunis.

On the map herewith printed we have indicated the towns at present occupied by the forces of France, Spain and Germany. Their positions show the spheres of influence to which these Powers aspire, but they are likely to be shifted about like the claims staked out in a new mining camp. For in all cases except the established Spanish holdings, like Ceuta and Melilla, the occupation is professedly temporary and not formally conceded by other nations.

## Business and World Peace

Now that each of the great Powers has locked up in dreadnoughts, and for all the purposes of peace has destroyed as much capital as would have put the industrial plant of a nation into first class condition, or abolished the slums of the large cities, or paid for a considerable part of the railway property that will have to become a public possession when we get civilized enough, it is announced that dreadnoughts are no longer up-to-date fighting machines. They will all be scrapped pretty soon, because the new type of battleship is to be a swift, hornet-like affair, with which no clumsy bumblebee of the ocean could hope to contend. Nothing less than a 35-knot speed will answer the new requirements.

This development was foreseen and predicted by the peace advocates years ago, and it justifies the protestations that have been made against the naval expenditures of recent years.

Putting aside for the moment the peace argument, and looking at the problem strictly from the viewpoint of preparedness for war, the United States and every other formidable Power has been on the wrong track. Of all the preparations for effective war, the most important is financial ability. Next to this is industrial preparation, by which we mean first-class equipment for quickly turning out and putting into service whatever engineering is most advanced in design, and likely to be most serviceable when the war begins.

That every strong nation should have a large number of thoroly trained men of scientific grasp studying military and naval problems and ready at a moment's notice to furnish plans and specifications for military and naval arms, may or may not be conceded by the more radical peace advocates, but from the standpoint of those who believe that the end of war is not yet in sight, a strong argument may be made that the intellectual and the industrial preparedness for war is more likely to prove decisive in the future than a heavy burden of fixed capital in the form of ships and arms which will prove to be antiquated when action begins.

We are not disposed, however, to admit that it is now necessary to regard preparedness for war in quite the light in which, historically, every important nation has viewed it. It is becoming every day more clear that the great financial interests of the world can "hold up" war when they once make up their minds to do it. We do not overlook the fact that rumors of war, like those which have disturbed the markets within the last few days, instantly exert a depressing effect upon financial operations. This is because dealers as yet have no reason to suppose that the financial powers have definitely taken their stand against further military operations. If that fact were once demonstrated and made clear, war rumors would have no more effect than the comets and eclipses that in other days were as disturbing to business men as they still are to superstitious minds.

What is chiefly needed today in the interest of world peace is a policy of dar-

ing and resolution on the part of the leaders of finance, industry and public opinion. The first step is to recognize frankly the fact that certain powerful interests still believe in war and that certain national ambitions are of such a character that, without hesitation, war would be resorted to to further them if the step could be taken safely. Everybody knows what those ambitions are and where they are centered. That part of the civilized world which does not share them is quite large and powerful enough to prevent their realization by war, if the determination to do so can be formulated and organized. It is entirely within possibility to make the resort to war so disastrous to the world standing of any great nation that attempts it that the purpose will be abandoned. The moment that the great financial interests say the word it will become suicidal for any nation, however obsessed with notions of its own greatness, to break the peace.

## The Air Power

NAPOLEON once said, "The English inhabit the sea, the French the land, the Germans the air." The remark was intended as a jest at the impractical speculative character of the German mind, but now it can be applied literally, altho the hegemony of the three elements must be differently distributed. The sea power of England is still unshaken, but Germany is now lord of the land and France is leading in the conquest of the air. Germany indeed challenges the championship in both the other realms, but her navy is yet no match for England's even on paper, and she appears to have been distanced in her recent rivalry with France to see which would be the first to get off the ground. This is due to a difference of opinion on the question of specific gravity; the Germans preferring machines lighter than air and the French those heavier than air. Altho the balloon in its original shape and also its dirigible form were both invented in France, the French have abandoned them for the aeroplane, while the Germans took up the gas bag and modeled it after cigars, sausages and dachshunds. For a time the world was frightened with stories of aerial navies of gigantic air ships, ready to carry regiments and drop them anywhere. But tho the various Zeppelins and Parsevals were produced in such rapid succession that they had to be numbered like the asteroids instead of being named, they smashed or burned with almost equal rapidity, so it is doubtful whether Germany has at the present moment a single air-worthy dirigible.

But the French Government, without putting so much money into this new branch of the service, has got more to show for it. Lieutenant Conneau, who has won in the race around the circuit of the three capitals, Paris-Brussels-London-Paris, is one of many naval and army officers and civilians who are now competent to run flying machines. In their manufacture France has taken the lead, as was the case a few years ago in automobiles. In it is much the same thing, for the development of both aeroplanes and automobiles depended upon the perfecting of the gasoline motor.

That England should show no interest in aviation either as a sport or as a weapon of warfare is quite astonishing. When a dozen aeroplanes follow one another across the channel at three-minute intervals and return to the mainland without any accidents worth mentioning, it might have been expected that the island kingdom would find in it something worth looking at and thinking about. At Calais immense crowds assembled to speed the parting airmen and to welcome them back again, but at Dover there were fewer spectators than policemen. The English people will throng by the million to see a King who has recently been oiled by an archbishop and has had various obsolete weapons placed in his hands and taken away again by various antiquated functionaries, but anything so modern as an aeroplane does not interest them.

Natural defenses can no longer be depended upon. There are no Alps, no Pyrenees, and no Channel. There are now three ways of crossing the Simplon, by the pass, thru the tunnel, and over the mountain. The Italian Government is constructing substantial steel doors in the middle of the tunnel and mines underneath it, both operated by electricity from a distance, so as to check a subterranean invasion, but no way of checking an

aerial invasion has yet been devised. Aeroplanes are now in use which can carry ten passengers besides the pilot. They cost, say, $2,000 apiece, and travel at the rate of 60 miles an hour. That means that soldiers can be landed any night in any numbers in any country at a cost of about $200 apiece, and the machines can then return for more, dropping a few bombs on the way. This is a cheaper, safer and swifter way of getting into the enemy's country than hitherto known in the history of the world.

## Before and After the Civil War

It is a guarded article which Professor Banks has written for this issue of The Independent, we judge intended to have some influence in the section where he has lived. He evidently desires to lead the South to a better view of its history and its present duty, and at the same time he is careful to stir up as little sentimental opposition and prejudice as possible. For this reason he balances against each other what might appear to be the errors of the two sections in the periods before and after the war. Before the Civil War the Southern leaders made, he says, a great mistake in not bending their energies to the restriction of the area of slavery and its gradual extinction; while after the war, he says, the North was at fault in the policy of reconstruction which gave the ballot to the whole negro race.

It is policy to discover something seriously wrong in the attitude of the North which can be set against what was wrong in the South. This makes the condemnation of the fathers easier to bear, and it is not strange that Professor Banks should take this view. There was so much bad in the Reconstruction period that it is easy to condemn its policy. That is now popular, and we allow Southern historians to write the story and guide the popular judgment; but we are of those who believe that despite debts, despite corruption, the general policy was wise and its purpose righteous and its adoption necessary.

Leaving out the consideration of the bad administrative features, what were the *principles* involved? They were, first, equal suffrage and equal civil rights, as exprest in the two last Amendments to the Constitution; and, secondly, a free public school system. What was desired was, to hold fast to our central doctrine of liberty and equal rights as exprest in the Declaration of Independence, and then to create an educated body of citizens who would be competent wisely to exercise these rights. The achievement of this purpose required the creation of new State constitutions which should embody these principles. To achieve it easily and quietly would require the co-operation of the white people of the South. To some extent, as in North Carolina and Georgia, this was given, with happy results. In other States it was bitterly resented, and evil results followed. The enfranchised negroes needed the kindly guidance of their natural white leaders, but they seldom got it, and this was unfortunate for both races.

Professor Banks implies that it was a blunder to give the ballot to the ignorant negroes. We suppose it might have been denied to the illiterate; but that rule would have disfranchised quite as many white men. Let us suppose the new constitutions had denied the ballot to those who could not read and write, that would have given the rule to an aristocracy representing only a minority in nearly every one of the States; and that would have meant an emasculated public school system. Those who made the laws would have had no interest in enlarging the electorate. The great gift of Reconstruction was that it created the public school, and provided that those to whom the vote was given should be able to cast their votes intelligently. There was no such system before the war; now it cannot be taken away. The system is even yet very imperfectly and very unfairly organized, but it is the best blessing the South has, and it is the gift of the Reconstruction period. The accidental evils resulting from the abstinence or opposition of those who might so easily have controlled the conditions pass away, but this splendid and far-seeing gift remains for all time for a better reconstruction of the South, thru the elevation of the depressed peoples of both colors.

The giving of the ballot to all, white and black, was high statesmanship. At

one step it assured the transformation from slavery to liberty. To achieve it immediately was necessitated by the conditions. Thruout the South those who believed in slavery, who held it impossible that the negro could rule, were enacting laws to reduce the freedmen to a condition of peonage equivalent to slavery. They were not to be called slaves, perhaps, but they were to be serfs, bond servants, held to the soil, not allowed free movement, subject to their masters. The public seems to have forgotten this, altho Professor Banks as a historian knows it and hints at it. The conditions required drastic and heroic treatment, and there were statesmen who saw it and acted wisely. The results prove that they were right. Education is vastly improved for both white and blacks, and the principle of equal rights and equal suffrage is upheld even when its enjoyment is more or less restrained. The progress under that policy of the negroes in education and wealth is nothing less than wonderful. The men, in the days before the war, who held that slavery was wrong in morals and bad in policy were totally right.

## Two Birds

One of the saddest records of the year 1910 is the death of the only male passenger pigeon known to exist in the United States. One female is known to exist, now about eighteen years old. There were four in Milwaukee two years ago and three in Cincinnati. The former are all dead and only one of the latter survives. Occasionally we hear of a flock of these pigeons in some remote corner, but it turns out to be mourning doves or something else in the pigeon line. Some of us can remember when this bird migrated by the millions. There seemed to be no end of them, as they flew north in April. The sky was often darkened with them at mid-day. From earliest morning until darkness at night flock after flock flew over.

Mr. E. H. Forbush, New England agent of the Audubon societies, recalls the fact that 80 tons of these pigeons were sent from one county in New York State, to be marketed in New York City, in the spring of 1849, and that at least 300 tons were dispatched from one town in Michigan in 1878. From another town we have the record of nearly 12,000,000 being shipped inside forty days. During two succeeding years 15,840,000 were shipped from another town. It did not seem then to be within the possibilities that the passenger pigeons could be obliterated. The lesson is a severe one and it is serious, for our recklessness accomplished the undesirable fact, and now we have just one survivor of this superb bird. The buffaloes are gone, and the passenger pigeons, and there are some hundred thousand guns undertaking to sweep out that most useful of all our birds, Bob White.

Bob White is the cheerful and familiar name given to a bird that is, all in all, the most important that we have in America. We are told by the educational leaflet of the Audubon Societies that not a single record can be found where this bird has done harm to the farmer. It possibly may destroy a few useful insects, but it does such wonderful work in destroying the hurtful that we can very well spare the few that are of some value. It eats potato beetles, cucumber beetles, wire worms, weevils, including the cotton boll weevil; grasshoppers, chinch bugs, squash bugs and caterpillars; and where you let Bob White run free and fearless he will nearly put an end to the existence of these pests. One of the teachers at Clark University gives as a single meal of one of these birds 100 chinch bugs, 12 squash bugs, 2,500 plant lice, 39 grasshoppers, 12 army worms, 568 mosquitoes, 8 white grubs, and 101 potato beetles.

What better friend than this could a farmer ask for? Our Bob will do for us what domestic fowls will not do, not a single tribe among them, for they will not eat potato bugs, and rarely squash bugs. It is said to be a fact that 400,000 sportsmen annually go out of our cities to scour the country, for the fun of killing Bob Whites. A good many farmers rent their lands for hunting grounds to this worthless lot of tourists. In this way farm taxes are paid, and it is said that in some parts of the country the education of children, beside other extraneous expenses, is paid for by Bob White. Beside his value as a scavenger and farm ally, this bird is a delightful

companion and friend. Existing all the way from Canada to the Gulf of Mexico, where undisturbed he becomes a semi-domestic friend, you will hear him from early in the morning till night, calling as he works, in his cheerful way, and not unwilling to come around your doorsteps for a bit of additional food. The birds of a covey are very fond of each other, conversing in a tender and twittering tone. They sleep in a circle, with their heads out to watch for danger. They have a marvelous power of self-concealment, and that is the only reason why they multiply in spite of human beings.

Bob has never been known to disturb fruit, or in any way to damage a grain crop, but he does destroy a vast amount of weed seed. One of our best observers computes that the Bob Whites of Virginia and North Carolina consume annually 1,341 tons of weed seeds, beside eating 340 tons of insects. It is time the American people waked up to the immense value of this bird. All that has been done so far has been to limit the hunting season, and in North Carolina only, game preserves give him better protection. Artificial production has become an absolute necessity, or we shall lose the one most important friend that man has left in the feathered kingdom.

## Fuss and Feathers

As bearing upon the question of desertions from the army and the irksomeness of military service in time of peace, lately discussed in our pages, it has been suggested that the modern uniform has a great deal to do with both. This is a suggestion certainly worth considering. That it has an intimate relation to the subject of voluntary enlistment in the National Guard is so true that it may cause surprise that the fact has escaped the attention of our State Governors and the gaudily uniformed officers of their military staffs.

There can be no question that in field service the inconspicuous suit of kahki is at once more useful, more comfortable and safer for the wearer than any uniform which must be carefully conserved to be attractive and which makes the wearer a conspicuous target for long-range rifle practice. When troops are called into service of the sort which requires the distribution of ball cartridges, the more completely the soldier divests himself of needless trappings and ornament the better; but for service of the kind in which the only danger to which he is exposed is that from admiring young women and their more practical mothers, there seems to be no good reason why the soldier should not, and every reason why he should, be permitted to make himself as attractive as possible. A resplendent uniform would attract a hundred eager recruits where a severe service uniform would discourage ninety and nine. This means that the soldier, to content him and gratify the desire for personal adornment which characterizes the male of every race and, indeed, every species, needs two uniforms—one for dress parade and the harmless ceremonies and pleasures of peace, and one for the serious business which, once in a while, may come his way. That there may be too much uniformity in uniforms, and that the dull monotony now affected by order of the war-lords who have not had and are not likely to have their baptism of fire is destructive of *esprit du corps* and of everything conducive to military enthusiasm in the piping times of peace, scarcely needs the support of argument.

Pride of uniform has always been the best asset of the soldier. He needs it. The young men of the regular army whom one meets on leave in our streets have less occasion for this kind of pride than ever before in the history of standing military organizations. Their dress is obviously practical for the plains or for picket duty along the Rio Grande, but for a city's streets in time of peace, when no arms are needed or permitted to be carried, it is as ugly as human ingenuity could devise. That the wearers become tired of it is not surprising. The way they wear it is strikingly in contrast with the carriage and swagger of the British soldier with his padded red jacket, his jaunty cap balanced on one ear and his bamboo cane. The soldier does not enjoy looking like a member of the uniformed force of the Street Cleaning Department. To be able to dispense with professional or even amateur soldiers altogether would be vastly to the public

advantage; but so long as we seek them it may be not unprofitable to consider whether to make the soldier proud of his uniform is not the best and cheapest way of making him efficient for the purposes of his enlistment.

**Taft vs. Roosevelt**

When all the enlightened sense of mankind was giving universal praise to President Taft for his epochal proposal that the United States and Great Britain should negotiate a treaty in which all questions, even those supposed to involve national honor, should be referred to arbitration, ex-President Roosevelt raised a lone voice in opposition. How can a man arbitrate, said the distinguished winner of the Nobel Peace Prize, if some one slaps his wife's face? This was rated as a poser to the mollycoddles and peace advocates by *The Outlook*, certain Irish-Americans and German admirals, despite the fact that the United States has no national wife and Uncle Sam is supposed to be a bachelor. Without mentioning any names, however, President Taft in his speech at Marion, Ind., on the 3d thus answered his predecessor:

"Objection has been made that an agreement to arbitrate a question of national honor ought not to be entered into, for the reason that when one's honor is affected one will never consent to have the question arbitrated, and therefore that to agree to do so in advance is to agree to do something that one will not be willing to do and that one does not intend to do, and therefore it savors of hypocrisy and ought not to be adopted as a national policy. I cannot concede the premises of this argument. I look upon a treaty of this sort as a self-denying ordinance, as a self-restricting obligation.

"It seems to be of the same character as the Constitution which the people as a whole set up, and in which they imposed checks upon their own power and limitations upon the method by which they exercise the ultimate sovereignty which is in them. It is not that they do not recognize that when the temptation comes to exercise arbitrary power they will not feel like exercising it, but it is that they deliberately impose those limitations upon their own action with the intention that they shall be effective however averse they may be to yield to them when the occasion arises for their enforcement."

President Taft is entirely right. A nation can no more properly defend its honor than an individual. The individual is no longer permitted to settle his dispute by his own might, for that makes him judge, jury and sheriff in his own case, which is contrary to the first principles of justice. The trouble is the world is now living under two systems of ethics — Christian for individuals, Pagan for nations, tho there is no double system of ethics in the moral world. President Taft sees this. Mr. Roosevelt does not.

**The Seals Saved**

Last week plenipotentiaries from England, Russia, Japan and our own country signed a convention at Washington by which pelagic sealing is to be prohibited for fifteen years, and as long after as the treaty remains undenounced. This is not only a triumph for American diplomacy, which for forty years has been working, but without avail till now, to protect the seals on the high seas, but it means that one of the most beautiful and intelligent of living creatures is to be saved from imminent danger of extinction. More than that, as President Taft indicates, it forecasts the adoption of international game laws to conserve the products of the oceans. It was high time this convention was adopted. The fur seals have been driven from the Antarctic and their only breeding grounds in the Arctic are now reduced to the Pribiloff and Commander islands, the former American, the latter Russian; while Japan owns a few breeding grounds of the Kurie Archipelago. The barren Pribiloff islets, however, shrouded in dense fogs during most of the year, and inhabited by 280 Eskimos, is the chief breeding place of seals left. In 1882 it is estimated that 2,000,000 seals went there every May to breed. Now the herd is reduced to 185,000. This appalling reduction is purely the result of killing the females in the open seas. A few hours after arrival on the breeding grounds each female gives birth to a pup, which she nurses for several months in the intervals of regular and frequent trips to the feeding grounds, a few hundred miles southward. The males signal their arrival at the rookeries with furious combats for possession of the "harems," consisting of from twelve to one hundred females. Seldom can a male fight his way in before he is seven years old. The American and

Russian Governments have prohibited the killing of the females, confining the land catch to the superfluous males. The young males, perched up on the rocky galleries surrounding the rookeries, are corraled and driven inland and there slaughtered. The Japanese and Canadian sealers, however, not being allowed on the rookeries, have kept a blockade of boats on the high seas beyond the jurisdiction of the United States and Russia, and as the females swim out in search of food, they kill them, tho four out of five sink before they are captured. Moreover, for each dead female a nursing pup on shore starves to death and an unborn one likewise perishes. The United States and Russia have now most generously agreed to put aside 30 per cent. of the skins taken from the young males on shore for Japan and Canada as a compensation for ruining the business of their sealing fleets. It would seem, therefore, that Japan, Russia, England and the United States have all acted most fairly and generously toward each other in this notable convention, and we congratulate those responsible for the happy result on the wisdom with which they have approached and solved a pressing and difficult problem.

**A Flagless Fourth Next**

Now that a noiseless Fourth has been established we suppose that the next thing will be a movement for the suppression of the American flag. Its colors are undeniably loud and crudely combined. Its conspicuous display in the bright sunshine must be exceedingly distressing to those sensitive souls who cannot endure the popping of firecrackers. Doubtless an effort will soon be made to get Congress to adopt a flag less offensive to a refined taste and to the feelings of foreigners. A delicate design in mauve on a neutral gray background would perhaps be endurable, provided it were not larger than four by six inches and never displayed except on official holidays and on public buildings. In the meantime a good deal can be done to discourage the display of the flag by making it dangerous to use it freely. Massachusetts, as we should expect, is taking the lead in the movement. One of the most popular and patriotic of American weeklies was so careless as to put the American flag into its Fourth of July cover design and the edition was suppressed in Massachusetts; and a farmer of the same State got into trouble because he hoisted flags in his cornfield, it being suspected that his motive was not purely patriotic, but in part inspired by a desire to drive away the crows. Luckily for us, those who first raised the American flag on Massachusetts soil were not so rigidly scrutinized to see if their motives were free from any taint of commercialism.

**Know Your Own City**

One of the most novel as well as interesting developments of social life is just now taking place among the Northwestern cities, notably Portland, Walla Walla, Seattle, and a few more of the more aggressive. The movement is known as a Know Your Own City Institute. At Seattle the second meeting has just been held, and it lasted for ten days. The subjects discussed were child labor, child play, child health, remedial agencies and destructive agencies; while school nurses, truant officers, juvenile court judges and other police officers took part in the discussion. They not only debated, but institutions were visited and studied. The result naturally has been to make the people thoroly well acquainted with their own community affairs, whereas in an ordinary city the citizens pass by their own public institutions utterly ignorant of what is going on inside. Seattle has also, every Sunday afternoon, what is called a community gathering. This is held in the parks, for an hour and a half. The exercises are not religious in character, not necessarily so, unless religion is supposed to take in civic affairs. A story is told or read to the children, brief addresses are delivered on educational or other civic topics, either by visitors or by citizens, and there is good music. The people seat themselves on the grass, and the attendance averages about five hundred. This is a new use for public parks, and a good one; use and not show. It looks now as if our cities were entering a new sort of life, a community life; which will be lived all together, and in which the idea of common weal will be dominant. It will no longer be possible

to say, If you wish to get acquainted you must live in the country. The institute idea looks upon the city or town as a unit, and community affairs are really common affairs, as they should be. New ideas go westward to plant themselves; all the same, they will come around to the East after awhile.

**Caricature and "Art"**

Forain, the French artist whose work with charcoal and pencil has endeared *le Figaro* to all true sharers in the comic spirit, announces his candidacy for election to the Institute de France. The candidacy itself has in it at least one element of humor: it is totally unexpected. One is prepared for the candidacy of the veriest hack in historical painting or prettified portraiture, but the thought of a "caricaturist" among the Immortals of the Art Academy! After all, it is only conservatism of thought that is shocked. How many French painters who wore official honors for a part of the last century would one not surrender, body and soul, reputation and product, for one Gavarni?—if not for a Job or a Caran d'Ache. The "caricaturist" is the Uncle Toby of pictorial art; in England, in the case of Hogarth (as creator of "The Harlot's Progress" and other series), he has been even its Fielding. He is also a social historian without fear if not beyond approach. He is a surgeon who operates without rubber gloves, if you prefer that metaphor. And Forain has the art of representing the irony as well as the absurdity of his contemporary life; one of his sketches is often equal in satiric power to a whole volume of print. Under the appearance of improvisation he seizes upon the very essence of things. May the Institute ponder the matter deeply and receive him! Perhaps the members can exact a pledge that he will not depict any of his confreres on the third page of *le Figaro*, tho we doubt if he will pledge himself to that.

**The Cheer Up System**

It has been left to Iowa to take a new turn in the fight with the White Plague. The State has hired one of its most eloquent preachers to travel about and teach the people to stop worrying, what to eat, but above all, to stay at home. It calls this the Cheer Up System. It seems that the Colorado establishment, while giving pure air and splendid treatment, cannot abolish homesickness. Separation from home kills where consumption cannot. The Iowa policy is to teach the gospel of rest and right living, with outdoor sleeping, and above all, staying with your friends. It has also passed a law allowing each county to build a hospital, on the most approved principles, where consumptives can be cared for without wandering into strange surroundings. Dr. Kepford, who has been selected as State Agent, believes that if the plan he is hired to advocate is carried out, tuberculosis can be eradicated from the State in a single generation. He begins by quarantining existing cases, preventing immigration of the disease, and causing the living of outdoor lives by the afflicted. He tells the sick that their recovery depends upon common sense. They must not only eat right, but they must think right and feel right and be right. Fresh air is the great factor for curing the disease. The doctor uses one phrase which should be repeated everywhere, and everywhere understood. He says that tuberculosis is strictly a house disease. It comes from confined or poisoned air, "aggravated by carpets, lace curtains" and other dust catchers. Have wide verandas and sleep in hammock beds. A screened porch can be had almost anywhere. If not, use a tent, or build a shack in the back yard —a shack of rough lumber and the floor raised several feet from the ground. Make the sides of boards half way up and the rest canvas. Temperance and purity are equally important with fresh air. Live right and do right, and your case is curable.

In every denomination there is a progressive and a regressive wing. Among the Disciples the latter is represented by *The Christian Standard* of Cincinnati. It hears of a missionary who does not admire that close communionism which requires that a member of some other denomination coming into the neighborhood be immersed before joining with them. Our Disciple contemporary is shocked at such liberalism. It says that

the early Church admitted no "unbaptized" members and if any such loose statements have been uttered by the French mission which is supported by it as treasurer, relations with it "will be severed immediately." That is quite Papal. It wants to know who is uttering such modernism. We suggest that it require all missionaries to take a "*Ne Temere*" oath.

The retirement of Dr. Burt G. Wilder from active work at Cornell University is a matter of national interest. No living biologist has made himself more interesting to the common people than Mr. Wilder. He has collected 1,900 preparations of brains of animals and men, and not a few of these latter are of our somewhat celebrated contemporaries. He has eighty more promised when their owners are willing to part with them. Dr. Wilder will make his home and studio at Brookline, Mass., the home of his boyhood. He declares that he has no expectation or intention of closing up his work this side of one hundred years, altho his retirement from Cornell is at seventy. We do not doubt but that his most useful and happy years are still ahead, and we shall look to record many more of his discoveries.

The South Carolina school law apportions the school fund to schools on the basis of enrolled attendance for ten days in the school year. Accordingly, says the Columbia *State*, it is not uncommon for a parent to send his children to the free schools in September, withdraw them after two weeks, have them help on the farm for six weeks, and then send them to school again for a month. Thus, in hundreds of schools the names of 40 children may appear on the roll during the year and not more than 15 actually attend the school from day to day. We do not wonder that the State Superintendent wants the law changed to make the basis average attendance instead of enrollment. It is the training of pupils, not the payment of teachers, that is desirable.

We are waiting with interest for the arrival of those steamers whose departure from England was delayed a day or two by the desertion of the stewards and seamen an hour before the time of sailing. What would happen if the passengers should form a union and strike against having to drop gold pieces into the palms of these stewards at the end of the voyage? But it is more probable that the stewards, having forced the company by the strike to raise their wages, will force additional gratuities from the passengers by use of their customary methods of extortion.

Georgia, the Empire State of the South, is making steady and gratifying progress in the development of its public school system. The State now appropriates $2,500,000 for elementary education, and local taxation provides $2,000,000 more. To be sure there is much more to be done, particularly in the providing of fair wages to attract more competent teachers. An even more unfortunate condition than that of inadequate wages is the fact that wages are often not paid when due in cash, but paid in warrants because no money is available, other claims having the precedence, and the teachers have to get the warrants discounted at a serious loss. Nevertheless education is looking up in the counties that levy a school tax.

Dr. Labbé, of the University of Paris, who has for many years been engaged in the study of the diet of the laboring classes, reports that the average French workingman expends 48 cents a day for food, of which 25 cents goes for wine. He advises the use of more sugar, chocolate, beans, bananas, crackers, cheese and macaroni in order to obtain greater nutriment for the money.

The postal banks prove such a success and meet such a public want that the Postmaster General has to add a hundred to the number every month. It is the parcels post, however, that the people are now most crying for. And the postal deficit is now wiped out and $3,000,000 appropriated for deficit has been returned to the Treasury.

# Insurance

## Phoenix Mutual Meeting

The recent meeting of the managers of the Phœnix Mutual Life Insurance Company, at Hartford, Conn., brought forth many interesting discussions and opinions on the subject of life insurance. The company, which was organized in 1851, this year celebrates its sixtieth anniversary. President John M. Holcombe in his address remarked that before 1850 only nine companies now in existence had been organized. Life insurance in America was in its infancy, and, altho the country was already wealthy and well settled, there was less than $100,000,000 of life insurance outstanding. Even in 1860 there were but 60,000 lives insured for a total of about $180,000,000. During these years selections were made with little intelligence or care, and liabilities were not scientifically calculated. Officers entertained the opinion that whatever was left of the income after paying losses and expenses might be regarded as profits and divided among stock and policy holders, on the theory that the income would always be enough to take care of the obligations, and that no additional reserve would be necessary. By 1870 various States had specified standards of solvency, and the departments had in many cases made independent calculations of reserves. President Holcombe closed his address by stating that life insurance is not a mystery, altho it has many details. Nothing in the condition or management of a company should be concealed from its agents or policyholders. The field man cannot accomplish his best work unless he is sure that the home office is his friend and fellow worker. The agent performs a service to the policyholder when he insures him and is entitled to his friendship and assistance. If his dealings have been fair and open, he will find his policyholders his best assistants.

Henry H. Kohn, of Albany, made an address in which he called attention to the evolution in the life insurance business, requiring field men, with a thoro education in all practical life insurance questions. The time has gone by when an agent can answer questions by consulting his rate book. He must now be a student of life insurance, and be prepared to explain fully the advantages of the different forms of policies, as well as to discuss the individual needs of the applicant. The necessity for self-confidence in the agent was touched upon by J. Henry Powell, president of the National Life Underwriters' Association. The agent must believe in himself, in the company and in what he has to sell, in order to convince the applicant. Some do not believe in themselves, and fail, and then wonder why.

The Phœnix Mutual has enjoyed great prosperity during the last ten years. In this period the premium income has grown from $2,545,548 to $4,689,213, and the insurance in force from $63,802,139 to $126,350,616. The total assets on January 1, 1911, were $30,096,360, and the total number of policies in force was 67,342.

A PERPETUAL policy issued by the Liverpool and London and Globe Insurance Company in 1876, was recently called attention to in the closing of an estate. The policy was for $15,000 and the premium paid was $1,500. Under the terms of this policy if there is a loss the face is reduced by the amount paid by the company, unless the holder pays 10 per cent. of the loss, which reinstates the policy. The company does not issue these policies any longer, and very few are still in force.

CHICAGO broke the record for fire alarms on the Fourth of July with 164 calls. Nearly all the fires were due to fireworks. The total loss, it is estimated, will not be over $5,000. This is the smallest loss for that city for any Fourth of July in forty years.

IN the recent fire at Coney Island, where the wooden buildings burned like tinder, the concrete municipal bathing house stood unharmed. Such examples are strong arguments in favor of concrete construction.

## Collector Loeb's Work

Mr. Loeb, Collector of the Port of New York, has held his office a little more than two years. In the fiscal year just ended he collected in fines, penalties imposed upon smugglers, and compromises offered by importers who confest that they had defrauded the Government by undervaluation, $2,914,158. This is more than the similar collections for the preceding seventeen years. An examination of the record shows that the annual average for the fifteen years ending with 1908 was only $62,424. Mr. Loeb was Collector for a part of 1909, and in that year the sum rose to $1,048,233. In 1910 there was a further advance to $1,507,731, and now there is added $2,914,158, making for three years a total of $5,470,122. The latest large compromise offer accepted was that of $1,180,000 from Duveen Brothers, the well-known dealers (London and New York) in works of art. They are under indictment. It may be observed, also, that the revenue collected on ocean passengers' baggage has increased from $709,895 in 1909, and $1,448,344 in 1910, to $2,305,562 in 1911. It is quite clear that Mr. Loeb has earned his salary. It may be that his activity in enforcing the law and punishing fraud excited personal hostility which prevented his admission to the Union League Club.

## A Great Crop of Cotton

The Government's latest cotton report points to even a larger crop than was indicated a month ago. On May 25 the condition was 87.8; on June 25 there had been an advance to 88.2. These are the highest figures reported for a corresponding date in ten years, and they are far above the average for the last ten years, which was only 80. With the condition figures is an official estimate of the yield, and this estimate is 14,425,000 bales, a record-breaking crop. The greatest quantity harvested in the past was 13,679,954 bales, in 1904. Allowance is made in the estimate for the probable abandonment of 1,000,000 acres and for average depreciation hereafter. August and September are the critical months for cotton, but there is every prospect now of an exceptionally large yield. Some say that the increase is due partly to improved methods of cultivation, and it is true that experiments have shown that the yield per acre in certain parts of the cotton belt can be doubled; but the crop was almost as large seven years ago, on a much smaller acreage. The distribution, in acres, is as follows:

| | |
|---|---|
| Texas | 10,868,000 |
| Georgia | 5,119,000 |
| Alabama | 3,815,000 |
| Mississippi | 3,454,000 |
| South Carolina | 2,705,000 |
| Oklahoma | 2,622,000 |
| Arkansas | 2,446,000 |
| North Carolina | 1,587,000 |
| Louisiana | 1,118,000 |
| Tennessee | 822,000 |
| Florida | 284,000 |
| Missouri | 115,000 |
| Virginia | 37,000 |
| California | 12,000 |

Unofficial reports at the end of last week were favorable with respect to all crops, oats and hay excepted. Winter wheat has been harvested in fine condition; spring wheat is doing well, except in South Dakota, and corn, it is said, has suffered but little in the States of largest acreage.

....The $125,000 bond issue of the city of Cebu, Philippine Islands, for sewers and water works, has been awarded to William A. Read & Co., of New York, whose bid was 102.33.

....The President of the Canadian Pacific says that neither that company nor any of its allied companies has been negotiating for control, or an interest in, or a working arrangement with, the Erie Railroad Company.

....Not long ago a syndicate representing English spinners bought 32,000 acres of cotton land in Mississippi. Last week it became known that a syndicate of Dutch capitalists had purchased 9,000 acres in the same State and taken options on several adjoining plantations.

VOL. LXXI NEW YORK, THURSDAY, JULY 20, 1911 No. 3268

## Survey of the World

**Reciprocity in the Senate**

It is now expected that Congress will adjourn before August 15. On the 14th, an agreement was reached in the Senate, providing for final votes as follows: Reciprocity Bill, July 22; House Wool and Woolen Bill, July 27; Farmers' Free List Bill, August 1; Reapportionment, August 3; statehood for Arizona and New Mexico, August 7. On the 10th there were votes on the several amendments which Mr. Cummins and Mr. Simmons asked the Senate to add to the reciprocity agreement, and all were rejected, the number of those in opposition ranging from 50 to 53, while the largest number of affirmative votes was 14. Two Democrats, Mr. Bailey and Mr. Simmons, were counted with the insurgents in the minority. On an amendment giving the President power to abrogate the agreement if Canada should violate any of its provisions, the vote was 19 to 38. On the following day, Mr. Bailey chided his fellow Democrats because they did not stand with him and the insurgents for the amendments. Mr. Williams replied, and there was some evidence of bitterness. On the 13th, Mr. La Follette began a long speech in support of bills, which he offered, for the revision of several tariff schedules. For three or four hours he spoke in denunciation of President Taft, reviewing his course with respect to the tariff, the Ballinger controversy and other matters. He accused the President of treachery to Mr. Roosevelt. Mr. Taft, he said, had betrayed the trust given to him by the people. He had surrendered to the "special interests," had broken his campaign promises, and in the reciprocity agreement had been false to the principles of his party. He had tried to buy the favor of insurgents by giving appointments to office. Mr. Bristow also spoke against reciprocity, saying that Mr. Taft and the Democrats, in the interests of the Trusts, had made an alliance against the farmers. Mr. Bailey offered the House Free List Bill as an amendment to the reciprocity agreement. It was rejected by a vote of about 5 to 1. The bill for revising the duties on wool and woolens, offered by Mr. La Follette, is quite different from the bill passed by the House. The prediction is made that the vote on it will be a close one, and that the bill may be passed. Mr. Underwood, the House leader, says the House will not accept it. In conference, however, a compromise might be reached, and thus a bill affecting the wool and woolens schedule might be sent to the President. It is believed that he would veto it, holding that revision should await the report of the tariff board.——Dispatches from Ottawa say that if the Opposition persists in filibustering against the agreement for two months to come, Parliament will be dissolved and a general election will be held, with reciprocity the dominant issue. Both parties are inclined to favor this course.

**Forests and Towns Burned**

Forest fires caused great loss of life and property last week in Canada, Maine and Michigan. In Canada, the Porcupine mining district, in Northern Ontario, was swept by flames. The towns of Cochrane, South Porcupine and Porcupine were destroyed, with the buildings of sixteen mines. South Porcupine, it is said, was reduced to ashes in twenty minutes. Several

hundred persons, among them many women and children, fled to the lake for safety. It is reported that 200 were drowned there. Many sought refuge in the mine shafts, and were suffocated because the shaft timbers caught fire. At first it was thought that 300 lost their lives at the Dome Mine in this way, but late reports say that nearly all were saved. At the end of last week 90 bodies had been found in the burned district, and estimates of the number of the dead ranged from 200 to 400. Several prospectors perished. Among the dead are Robert Weiss, manager of the West Dome Mine, and his wife, Captain Hamilton and Captain Dunbar. The loss is between $2,000,000 and $3,000,000.——In Michigan, north of Bay City, and even as far as Cheboygan, much property was destroyed, but only three lives were lost. The towns of Oscoda and Au Sable were burned. Some of the residents were rescued by steam barges on the river, others by trains of freight cars. The loss at Alpena was $500,000, and the total loss about $1,500,000, a considerable part of which falls upon the firm in which Congressman Loud is a partner. His home was burned and the members of his family were for a time in danger.——A large tract in Maine, near Moosehead Lake, was burned over, and scarcely anything is left of the village of South Waterboro. Near York Beach the flames took a thousand acres of timber. There were fires also in parts of the White Mountain District, in New Hampshire. The loss in Maine is estimated at $750,000. Rains on the 14th checked the fires both in Maine and in Canada.

*

**The Case of Dr. Wiley**

Much interest has been excited thruout the country in official reports upon charges against Dr. Harvey W. Wiley, head of the Bureau of Chemistry in the Department of Agriculture and widely known as an advocate of legislation to prevent the sale of unwholesome food or impure drugs. These charges relate to the employment, as an expert to assist in the enforcement of the Pure Food law, of Dr. H. H. Rusby, since 1888 the head of Columbia University's College of Pharmacy and a man of high rank in his profession. Not long ago a law was enacted providing that no one employed as an expert should receive more than $3,500 a year. This meant, it was held by legal executive officers, that the pay of an expert should not exceed $9 a day. Dr. Rusby had been accustomed to receive much more per day for scientific work or testimony in court for the Department of Agriculture, and he felt that for $9 per day he could not afford to perform such service. Therefore he was placed on the roll of the Department by Dr. Wiley and L. F. Kebler, Chief of the Division of Drugs, at an annual salary of $1,600, with the understanding that the old rates per day for scientific investigation and expert testimony should be paid to him, if necessary, until in one year they should amount to $1,600. He had received only about $100 under this agreement as to compensation, when it was referred to the Department's Committee on Personnel, which is composed of Assistant Secretary Willett M. Hays, Solicitor George M. McCabe and Chief Clerk C. C. Clark. This committee, in a long report, recommended that Dr. Wiley be "permitted to resign," that a certain amount of authority be withdrawn from Mr. Kebler, and that Dr. Rusby be dismissed. These recommendations were submitted to Attorney-General Wickersham, who sent to the President an elaborate opinion of about 4,000 words, the conclusion of which was an approval of the committee's decision on the ground that the alleged "irregularities in the appointment" of Dr. Rusby "merited condign punishment." When the papers were laid before Dr. Rusby he addressed to Secretary Wilson a long letter, giving a history of the arrangement as to compensation, saying he was not aware that it was in any sense illegal or objectionable, and expressing indignation. All the papers were also submitted to Dr. Wiley, who, it is understood, will not resign. At the end of last week the President said that no final decision had been reached. Friends of Dr. Wiley say to the press that two of the three members of the committee have been in sharp opposition to him in Department controversies as to questions arising under the Pure Food law. It is reported that

THE BRIDGEPORT WRECK

The Federal Express from Washington to Boston jumped the track at Bridgeport, Conn., on the morning of July 11. Twelve persons were killed and forty-seven injured.

friends of the President have said to him that there should be nothing more than a formal reprimand for what was a merely technical irregularity. The President has received many protests against the proposed compulsory resignation of Dr. Wiley, the first having been sent by the executive committee of the Committee of One Hundred of the American Association for the Advancement of Science. On the 14th, the House Committee on Expenditures in the Department of Agriculture decided by unanimous vote to make a thoro investigation.

**Cuba and Central America**

Owing mainly to attacks upon President Gomez and his Government by the Opposition press, there is much political excitement in Cuba. Speaker Ferrara and other friends of the President say they have evidence that the campaign of vilification against him has been made in the interest of Vice-President Zayas. Intervention by the United States is predicted by one or two journals, but Secretary Knox has sent word that our Government does not intend to intervene, and for this he has received the thanks of Cuba's Secretary of State. Mr. Stimson, our Secretary of War, now in Panama, is soon to visit Havana. The Opposition papers say he is coming to inquire about "the reckless concessions" made by the Gomez Government, and remark that this is humiliating to the republic. General Nodarse, director of the National Lottery, resigned last week, after he had been accused by Major Andre's paper, *El Dia*, of taking $80,000 a month for himself and the President in commissions on tickets. It is thought that his resignation foreshadows a duel. Andre has demanded the impeachment of Gomez. It is asserted in Havana that our Government is about to appoint "an adviser to the President." At a meeting of Liberal leaders, Speaker Ferrara gave notice

that President Cortes would not be a candidate for re-election. The United States consul at Havana estimates the investment of American capital in Cuba at $220,000,000, of which $50,000,000 is in sugar mills and plantations, $25,000,000 in public utilities, $25,000,000 in railroads and $15,000,000 in the mining industry. The revolution in Hayti gains force. Many towns in the north have been taken, and there were battles last week within 30 miles of the capital. The Government troops were defeated at Valliere. General Leconte, revolutionist leader, has arrived from St. Thomas. It is reported that Hayti has rejected the proposition of the United States, Great Britain, Germany, France and Italy, that the pending claims of their citizens be settled within three months. At Washington it is said that no reply has been received. ——Ex-President Zelaya is said to be promoting a revolution in Nicaragua. He is in Belgium. ——It is admitted at Washington that the treaty relating to loans for Honduras and Nicaragua will not be ratified at the present session.

**More Fighting in Mexico**

There was a change for the worse, last week, in the condition of Mexico, and no more American troops are to be withdrawn from the camps on the border. In at least six States there was a renewal of the civil war, plots for the assassination of Madero were discovered in widely separated cities, and there were signs of an armed uprising against him. Labor strikes have seriously affected prominent industries. Several large smelting plants and the mines connected with them have been closed. In Vera Cruz the street railway is tied up. Workmen in all the industries there demand higher wages. In Chiapas, 2,000 armed men, recruited near the Guatemalan boundary, oppose Madero and have forced the Governor of the State to resign. In Yucatan, the lower classes, free from restraint, have become brigands. They have destroyed much property and driven away the owners of estates. A political convention in Guadalajara ended in a bloody riot. In Ocotlan (Oaxaca), where Benito Juarez and Felix Diaz are candidates for Governor, eight men were killed in a battle between the supporters of one and the friends of the other. Arrests of men who had conspired to kill Madero were made in San Luis Potosi and Puebla. One of the accused prisoners is a member of Congress. Much anxiety was caused by a battle in Puebla between Maderists and Federals. On the 11th, twenty were killed there in a fight between Maderists and the Rural Guard. On the 13th, an attempt by drunken Maderists to open the jail brought on a battle with Federal troops. This continued for two days and 135 men were killed, a majority of these being revolutionists. In the midst of this disturbance Madero arrived in the city, in accordance with a plan made several days earlier. He sought to reconcile the fighters, but the Maderists appeared to be beyond his control. In many places the revolutionist soldiers are not disbanding, because they are not satisfied with their pay and are disappointed because the large landed estates have not been cut up and given to them. In Oaxaca alone, 3,000 refuse to lay down their arms.——Lord Cowdray (Sir Weetman Pearson) denies that a sale of the Pearson oil interests to John W. Gates's Texas company has even been considered. —— General Orozco, who wants to be Governor of Chihuahua, remarks that Provisional Governor Gonzales will lose his friendship if he becomes a candidate for Governor at the approaching election.——A club of 500 women, advocates of woman suffrage, has petitioned the Government for legislation permitting absolute divorce.—— Orozco attacked a band of Magonist brigands, on the 15th, and killed twenty of them.

**South America**

King George of England, as arbitrator for the adjustment of the Alsop claim against Chili, has awarded to the American claimant $935,000. This claim was for money advanced by Alsop & Co. to Bolivia in 1874. When the province of Arica passed to Chili, the latter country assumed the obligation, which had been secured by Arica's customs revenue. The Chilian press rejoices over the award, saying that it is a victory for Chili and that it proves the

injustice of Secretary Knox's attitude. Two or three years ago he demanded a settlement, undertaking to close our Legation at Santiago if one should not be made by arbitration or otherwise. But it is pointed out that the award is for almost the entire principal of the loan and that it is more than four times the sum offered by Chili.——Altho the arrival of ex-President Castro at a point on the Goajira peninsula, near the Venezuelan boundary, and the assembling there of 1,000 of his followers, were reported week before last, neither he nor his soldiers could be found last week. The coast of the peninsula was searched by Government troops, but there was no trace of him, and on the 14th the Government denied that he had reached the coast.—— Colonel Jara, who proclaimed a dictatorship in Paraguay and was placed in prison on the following day, arrived in Buenos Ayres last week. He said he had been appointed Ambassador to Germany, France and Belgium and was about to study German military methods.—— When Peru's Congress was opened, on the 13th, a riot was caused by a group of secret police, who cried "Long life to the Government" and "Death to Congress!" Two hundred shots were fired and two bystanders were killed, but all the deputies escaped. On the following day, the Government members, a small minority, with the protection of the police, elected a presiding officer, against the protest of the one who had already been elected by the majority. The situation caused anxiety. ——Another anarchist plot has been disclosed in Buenos Ayres. Several Italians were arrested. Their houses were found to be bomb factories.

**Spread of the Cholera**

It is now known that the Asiatic cholera, which prevailed in certain parts of Southern Italy last summer, broke out this spring with increased virulence and has been raging there ever since to a degree unsuspected by the public. The Italian health authorities have apparently complied with the international regulations in regard to official notifications of cholera centers, but the Italian press has kept silent and foreign correspondents have been prevented from telegraphing the information. Last summer the hotels and pensions of Italy were largely deserted because of the alarm of the tourists and this year the Italians were particularly anxious to avoid another cholera scare because of the expositions at Rome and Turin. The last of June the Premier and the Minister of Foreign Affairs called attention to the low death rate in Rome and declared that Italy was in better sanitary condition than ever before, which was doubtless true so far as it went. But it is now admitted by the official reports that there have been 900 cases of cholera in Italy since June 8. Palermo is reported to have had 282 cases and 75 deaths, and other parts of Sicily 27 cases and 11 deaths. From Naples there are reported 215 cases and 60 deaths, and from the rest of Continental Italy 374 cases and 116 deaths. Venice is also infected, and it is feared that the epidemic will spread to Austria. Newspaper correspondents give much higher estimates than the official reports, claiming that there have been 2,300 deaths from cholera in Palermo alone. Vessels arriving from Italy have been for some time carefully inspected in New York harbor, but nevertheless the disease broke thru quarantine and two deaths have occurred in New York State, one of a discharged watchman from the quarantine island, and another an Italian immigrant who died at Auburn, N. Y. Another recent immigrant was taken down in Brooklyn with the disease. Altogether there have been 18 cholera cases in New York and 5 deaths, including those in quarantine. The German steamer "Moltke" and the Anchor Line "Perugia" both had cholera on board on their arrival from Naples. According to Health Commissioner Doty, "a majority of the vessels which have recently come from Italy have either brought actual cases of the disease or furnished evidence of it having occurred in transit." Cholera is not spread thru contact or from clothing, but acquired like typhoid, thru food and drink. It has recently been discovered that there are "carriers" of cholera as there are of typhoid, that is, individuals who may harbor the germs for a long time without succumbing to the disease, and who convey it to others thru unclean hab-

its. This accounts for many mysterious irruptions of the disease in distant localities and its revival after long latency.

**The British Parliamentary Crisis**

The conflict between the two houses of Parliament will come to the critical point during the coming week when the veto bill with the amendments added by the Lords will be returned to the Commons. It was thought by some that the amendment offered by Baron Newton providing that no bill for the further limitation of the legislative powers of the House of Lords until after a general election might serve as a basis of compromise by being accepted by both parties, but instead of that it was rejected by both and withdrawn by the mover without a vote. Lord Cromer's amendment, allowing the House of Lords power to veto bills imposing taxation if in the opinion of a joint committee the main governing purpose of such bills is not purely financial in character, was carried without a division. The bill as amended by the Upper House will be passed about the 20th and then the Prime Minister will be expected to break his silence as to whether he has received guarantees from the King to create enough Liberal Lords to overrule the opposing majority. The extreme Conservative papers urge the Lords to "die in the last ditch," but the more moderate organs of the party advise them to "drink the hemlock."——The Declaration of London, regulating neutral commerce in time of war, was passed on its second reading. The test vote on the question of referring it to a committee of experts showed 301 to 231 in its favor, the violent opposition to its ratification having the effect of cutting down the Government majority by about 40. Sir Edward Grey, Secretary of State for Foreign Affairs, used as his chief argument that the United States had approved it without reluctance:

"It has thereby taken a deep interest in promoting the establishment of an international prize court, and in its view acceptance of the Declaration of London is essential to the establishment of a successful working international prize court. The belief that the United States Government regards the policy of a prize court convention and the Declaration of London with indifference is a very dangerous misapprehension, which would be removed if we were at war with a continental power. That continental power, knowing perfectly well the risk and desiring to avoid the danger of any friction with the United States, the great maritime neutral power interested in our food supply, would in all likelihood prefer to accept the rules of the Declaration of London and be prepared to refer to arbitration any question which arose with regard to it."

——The ceremony of the investiture of the Prince of Wales at Carnarvon Castle was hardly less impressive than the coronation. Here the King and Queen were in the background and the boy stood alone in his robe and coronet before the 20,000 spectators. The choral singing, as usually in Welsh festivals, was very beautiful.

**Anglo-Japanese Treaty**

The treaty which confirmed the alliance between Great Britain and Japan would have expired in 1915 on twelve months' previous notice by either party. Whether it should be extended beyond that time, and if so, in what form, has been of late a frequent subject of discussion in the press of both countries. The primary object of Japan in forming the alliance was to secure a free hand in Korea, as it was specified in Article III that Japan

"possessing political, military and economic interests in Korea, Great Britain recognizes Japan's right to take such measures for the guidance, control and protection of Korea as she may deem proper and necessary to safeguard and advance those interests, providing the measures so taken are not contrary to the principle of equal opportunities for the commerce and industry of all nations."

England on her part felt the need of matching the rapidly increasing naval power of Germany and of quieting the agitation in India aroused by the successes of Japan. These two reasons still hold, for Germany's influence in world politics has not diminished, and the unrest of India has not died down. On the other hand, the treaty has not been popular either in England or the over-sea dominions. British capitalists were obliged to withdraw from railroad projects in Manchuria because they interfered with Japanese interests there, and at the same time they complained that the Japanese were taking advantage of their position to monopolize the Man-

churian trade. The treaty was especially offensive to Australia and Canada because it might involve Great Britain in a war with the United States in defense of Japanese interests. An agreement for general arbitration, such as is now pending between Great Britain and the United States could not be concluded while this treaty remained in force. But this difficulty has been swept away by a revision of the treaty which was announced from London July 14. The preamble gives as the reason for the revision "the important changes which have taken place in the situation since the conclusion of the Anglo-Japanese agreement of August 12, 1905." The new treaty holds for ten years, that is, about six years beyond the expiration of the old. The article relating to Korea, quoted above, is eliminated as unnecessary now that the annexation of Korea is completed. So are also the articles in which Japan recognizes the right of Great Britain to protect her Indian possessions and that in which Great Britain promises neutrality during the Russo-Japanese war. The most important change, however, is the addition of Article IV, which reads:

"Should either high contracting party conclude a treaty of general arbitration with a third power, it is agreed that nothing in this agreement shall entail upon such contracting party an obligation to go to war with the power with whom such treaty of arbitration is in force."

It is understood that Japan intends to apply for admission to the general arbitration pact between Great Britain and the United States. France also contemplates entering into the same agreement. Our Government was informed of the terms of the new treaty some days before it was made public. It was placed before the recent Imperial Conference for the consideration of the representatives of the over-sea dominions. The treaty is regarded by the French and German press as materially weakening the Anglo-Japanese alliance.

**Italian Insurance Monopoly**

The efforts of the Italian Government to secure a state monopoly of life insurance business have been frustrated for the time being and may possibly be defeated. The Government bill, which was introduced to please the Socialists, met with both domestic and foreign opposition. In Germany a committee of defense was formed, which made a general attack on Italian finances thru the press and urged the public not to invest in Italian enterprises, as they were likely at any moment to be expropriated by the Government. The representatives of foreign Powers in Rome, including the United States, presented a collective note to the Government protesting against the proposed law on the ground that it interfered with the vested interests of the foreign companies now established in Italy. It was suggested by them that, in case the companies were prohibited from writing any new business in the country, they should receive an indemnity from the Government. In defense of the bill the Government urged that the State was not obliged to compensate foreign companies doing business in Italy, because the proposed law permitted to carry the policies they now held and only prohibited them from taking new ones. Besides, it was claimed that the companies were not now doing profitable business in Italy and that the New York Life, the Equitable Assurance and the Mutual Life Insurance of New York had voluntarily withdrawn from Italy. In an effort to conciliate the opposition the Government accepted amendments granting the life insurance companies six years in which to close up their existing contracts, and also limiting the State monopoly to policies of less than $3,000. Policies above this amount the insurance companies were to be allowed to take on condition of paying the Government a tax of 5 per cent. instead of the 1 per cent. tax at present imposed. This, however, was not sufficient to allay the opposition, and Premier Giolitti was obliged to adjourn Parliament until November before bringing the question to a vote. He promised, however, that the bill should have precedence over all other legislation on the reassembling of Parliament, and insisted upon a vote of confidence before adjournment, which was passed by 289 to 118.

ON A TENEMENT HOUSE ROOF

Every available square foot of space on the roofs and balconies was occupied by sleeping forms, for the stifling heat of the rooms was unbearable. Those who could not find a place on the roof were forced into the street

# The Hot Wave

BY GARDNER RICHARDSON

THE first ten days of July witnessed a hot wave, extending from the Mississippi Valley to the Atlantic seaboard, remarkable in its duration and intensity. The last days of June, with reported temperatures of 92° at Denver and 98° at Kansas City, gave warning of impending suffering. By July 2 every newspaper in the country was devoting double headers on the front page to the record of the killing heat. New York reported a maximum temperature of 97°, the highest since 1889. Boston also reported 97°, Pittsburg 98°, Philadelphia 99°, and Chicago 102°.

The hight of the wave was reached on July 3, when over 100 deaths were reported, distributed from Maine to Missouri. In New York the official temperature, which is taken on a high building 400 feet above the sidewalk, rose to 98°, and thermometers on the street recorded as high as 106°. In Chicago alone 51 deaths occurred. The mills in Pittsburgh were closed when the temperature reached 105°. In Boston the mercury touched 102°, which was the highest figure since 1881. With minor fluctuations in different cities the hot wave held sway on July 5. The cumulative effect of the strain showed itself in 250 deaths thruout the country. Chicago again suffered the greatest loss, with 64 fatalities.

On July 6 and 7 the killing heat continued. A promised relief came on Saturday, July 8, but proved to be only temporary, for on Sunday the thermometer again reached 94° or over in New York, Boston, Philadelphia and Kansas City. While some cities reported an improvement, the scorching heat continued until July 12. During this period 1,200 deaths were reported in the United States, and if the unreported deaths and those indirectly due to the heat were added, the total would probably be not

tures of 115° and 120° have been officially noted. In these localities the extreme dryness of the atmosphere makes the heat endurable. In our large American cities, however, where at best the poor are herded in unsanitary and overcrowded tenements, a period of abnormal heat, accompanied by excessive humidity, causes untold suffering and heavy mortality.

The stifling inside rooms, with no ventilation, are like ovens, and are humanly uninhabitable. A few can find com-

A WHOLE FAMILY ON A BLANKET

[illegible] under the approach to one of the bridges in New York City

far from 2,000, establishing an unprecedented record.

Except from sunstroke among Northern races temporarily residing in torrid countries, people rarely die from heat in the tropics. Their clothing and life are adapted to the prevailing conditions. In Southern Arizona the temperature touches 110° with no fatalities, and on the edge of the Sahara Desert tempera-

fort on the roofs or on the iron balconies, where they drag their mattresses. These spaces are comparatively limited, however, and the vast suffering multitudes must seek a breathing place in the streets and city parks.

In New York, during the hot wave, thousands of families were forced to sleep on the sidewalks or in the streets, with their heads pillowed against the

girls. A few that were more ambitious camped out in the city parks under the bridges and wherever an open space gave an opportunity to sleep beneath the sky. Great throngs every evening journeyed to Coney Island and other points on the seashore to escape the sweltering city heat and spend the night upon the sand. This was a luxury which the head of a poor family could not afford, for to transport even four down from the city and back would cost 80 cents, but the middle classes were glad to exchange a bedroom in the hot city for a small section of the sandy beach.

During the day ambulances were busy answering calls thruout the city. Over 1,000 prostrations were reported in New York, not counting those treated privately in their own homes. The work-horses suffered severely, and despite strict orders to the police to prevent overloading, 900 horses perished from the excessive heat.

The records of the Weather Bureau show many two and three day periods in past summers, during which the maximum temperature was continually over 90°, but longer periods are very rare. The last long period of intense heat was in 1901, when for ten consecutive days, beginning on June 26, the average maximum temperature in New York was over 93°. That summer a severe drought afflicted the West, and great damage resulted to the standing crops in the Mississippi Valley from forty consecutive days without rain. After the hot spell was broken, however, the remainder of the summer made a new low record in temperature.

To hunt for the silver lining in the cloud, we should remember that a touch of nature makes the whole world kin, and that New York sympathizes with Kansas City, and Philadelphia with Chicago, when the thermometer crawls up. The ice companies and soda fountains do an increased business, the oldest inhabitants have an opportunity to describe the hot spells they remember, to which they claim this particular one is not a circumstance, and all failures, mistakes and misdemeanors are dismissed with the blame on the hot weather.

NEW YORK CITY.

ON THE SAND AT CONEY ISLAND

The fortunate ones, who could leave their homes, spent the nights near the ocean. For several miles the beach was crowded with weary refugees from the sweltering city

# The Folly of Fortifying the Panama Canal

BY JAMES A. TAWNEY

CHAIRMAN OF THE COMMITTEE ON APPROPRIATIONS OF THE LAST CONGRESS

DURING the closing days of the last Congress, before the appropriation of $3,000,000 was voted, to begin the proposed system of fortifications along the Panama Canal, the estimated cost of which will be from fifty to sixty millions, hours of debate were devoted to the question of whether under existing treaties we had the right to fortify. Hardly as many minutes were devoted to consideration of the proposition itself; whether or not we should enter at all upon the policy of fortifying this great international waterway even when it is completed; what that policy will mean to the American people of the future in the way of permanent and extensive financial burdens; and whether it will be effective as a means of protecting the Canal, insuring its neutrality, or preserving its integrity.

Many of the foremost students of international law and treaty obligations held and still hold that we have no right to fortify. No one denies that by treaty obligations we have bound ourselves to give to the nations of the world the right to use the Canal on terms of equality with ourselves in times of peace as in times of war. We have therefore conferred upon the nations of the world a property right in the Canal, for we have given them the right to use; and the very fact that it commands such world-wide appreciation, that it is of such universal value and commercial importance, is the surest possible guarantee of its universal respect and protection.

But now, after spending almost half a billion dollars for the benefit of the world's commerce in the construction of the Canal, it is proposed to fasten upon the American people, not only the enormous expense necessary to the construction of fortifications, but thereafter the perpetual annual charge of many millions for the maintenance, the preservation and the protection of those fortifications.

Even suppose that we concede the right to fortify—an act so utterly inconsistent with all theories of international neutralization that it would have seemed absurd to deny or abrogate it in the treaties—to exercise it, will, in my judgment, not only impose unnecessary financial burdens upon the people, but will jeopardize both the neutrality and the safety of the Canal. The fortifications must not only be constructed, and maintained for all time to come, but from time to time they must be increased and renewed to meet the progress of the world in the arts of war. In addition to this it will always be necessary to maintain on the Canal a liberal standing army, as those fortifications will be the first target in any possible war.

The first appropriation of $3,000,000 has been made, in accord with the mad militarism possessing such popularity, today. But it is less than a drop in the bucket and in the preliminary measures upon which it is to be expended it will not be wholly thrown away, tho the movement to fortify should come to an end with this first appropriation. Indeed if in any way it could be made the means of calling the people of this country to a better understanding of the case to the folly and iniquity of fortifying the Canal, it may have been almost wisely expended. Therefore it is not yet too late, irrespective of the right to fortify, to consider carefully the effect of the new policy upon future generations as well as its effect upon our most solemn treaty obligations to insure the neutrality of the Canal, and our duty to protect the Canal itself from injury.

We all know perfectly well that if at first the policy of fortifying the Canal had been contemplated, or if it had been claimed that it would be necessary to

fortify it the construction of the Canal would not have been authorized. Much of the original opposition to our embarking upon the great project was based upon the enormous cost contemplated—tho at that time it was believed that it could not exceed $150,000,000. Now the cost of construction alone has reached the sum of $400,000,000, exclusive of the cost of constructing and maintaining fortifications. And in meeting this vast sum by bond issue, we are imposing the entire cost and the constantly accruing interest as a burden upon future generations.

If the public realized the vast amount of this burden I believe that on this account alone they would demand a halt in any and all unnecessary expenditures. It may be argued that we have the legal right to fortify, if we desire to; but no one will argue that we have the right to impose such a burden on posterity with no accompanying benefit. Here is a brief estimate of the amount of that burden: First we have authorized the issue of $375,000,000 of bonds, bearing 3 per cent. interest, to meet the expense of constructing the Canal, for the benefit of the commerce of the world. The annual interest on these bonds will be $11,255,000. The annual estimated cost of maintaining the Canal, not including any serious accident, is $7,000,000. The cost of fortifying, according to one of the best informed engineers in the army, under the plan of the fortification board, will reach $60,000,000. The annual interest on that sum will be $1,800,000, and the estimated depreciation will be $6,000,000 a year. General Wood stated to the committee that it would be necessary to keep upon the Canal a force of 7,000 men, including coast artillery and cavalry, and according to General Wood's testimony the cost of maintaining the 7,000 men in the Canal Zone will be $8,400,000 annually. This will bring the aggregate annual expense of operating and maintaining the Canal for the benefit of the commerce of the world, in round numbers, up to *$36,000,000 a year*. The highest estimate thus far made of the receipts accruing to the Government from the operating of the Canal is $4,000,000 annually. The difference, $32,000,000 a year, is the net loss to the people of America, thru the Panama Canal, in case we add the expense entailed by fortifying.

Now, wholly aside from the right to fortify and the cost, if it were desirable to invite the nations of the earth to destroy the Canal, no better method of extending that invitation could be adopted than to fortify it. It will make it the magnet for attack; our most valuable and vulnerable possession. We forfeit thereby the co-operation of all the nations making use of the Canal. We assume that it is a perquisite of war. We assert that when we no longer deem the neutralization of the Canal necessary to our own interests we are prepared to violate our solemn treaty obligations with other nations by terminating that neutrality and individually assuming the entire control and defense of the Canal against the world, for our own benefit.

This is not a mere thought of what might be, it is an assertion of what already is, in the mind of the War Department, in urging the fortification of the Canal. In proof of the statement I recall the testimony of Lieut.-Gen. Leonard Wood, Chief of Staff, before the House Committee. When he was asked: "Is it not a fact that in the last analysis the purpose of fortifying the Canal is to insure to the United States its use in case of war, as a military asset?" he replied, "That is undoubtedly the most important of all the purposes in fortifying the Canal." Again, "The purpose is to secure to the United States the exclusive control of the Canal in time of hostilities?" he replied, "That is the principal purpose of fortifying the Canal." Later, he said, "We shall build the Canal and maintain it for the use of all countries in time of peace and control it in time of war as our safety and interests demand." Is it possible by any chicanery to make these statements coincide with our solemn treaty promises of neutralization or with any international neutralization which would jealously guard and protect the Canal, making all nations sponsor that it should receive no injury, being equally important to the commerce of all? It discloses a national purpose in respect to our relations with other nations of the world more in keeping with the diplomatic policies of nations during

the Middle Ages than with the high standard of national honor which all nations now profess and endeavor to follow.

In fortifying the Canal we make it the legitimate object of prey, if we are ever entangled in war with another nation—and the only possible reason for fortifying is the possibility of such a very improbable entanglement. Instead of protecting the Canal by fortifying it we are most seriously jeopardizing our property. We are making it the legitimate object of war and deliberately challenging a belligerent nation to injure or capture it. We are sacrificing the cordial cooperation in protection of all the great nations of the earth who, on account of the commercial facilities freely offered in our treaty compacts, would absolutely refuse to allow a nation simply because it was at war with the United States, to injure or appropriate a neutral property of such mutual value in which they each held a property right. To my mind the proposition seems almost incomprehensible, and yet our fortifying the Canal with the avowed purpose of the War Department, is equivalent to saying to all the nations of the world:

"Altho we have given to you a property right, the right to use the Canal in times of peace as well as in times of war, we are not willing to rely upon your honor or your fidelity in the exercise of that right, and, therefore, we must be prepared to prevent you from exercising your right."

In my judgment—and I believe it is the judgment of the great majority of the American people who have not been hypnotized by the mania of militarism—it would be far better for America, far safer for the Canal, for us to rely entirely upon the material interest which every nation on the earth will have in maintaining the integrity of the Canal and protecting it from injury or appropriation, rather than to defy them all and challenge any of them, by constructing fortifications—which can be for no purpose in the world except as stated by General Wood to be prepared to, ourselves, violate any treaty of neutrality by holding the Canal by force of arms in time of war.

If we cannot rely for the protection of the Canal and its invulnerable neutrality under any and all circumstances upon the honor, the good faith, and the personal interest of all the nations of the world, combined, for whose mutual benefit the American people have constructed it, at a cost of $400,000,000, then we cannot protect it with fortifications, no matter how many millions more we make the burden which we are laying upon the shoulders of posterity.

If we are attempting the policy of holding the Canal against the world—and its fortification means nothing else—we are embarking upon a plan which will grow more and more burdensome as time goes on, making it absolutely necessary to quickly increase the present proposition, with additional fortifications and armament, and to maintain permanently on the Canal Zone an army very much larger than the one at present approved. It will be our weakest point and the point of first attack in any conceivable war, and it will not rest with any other nations to object. It is too big a proposition for any one nation on this earth to undertake and it savors of the old, past ages, to attempt it.

We have outlived the feudal days when might made right, even if some of our military devotees fail to realize it. Economically the problems of all nations are the same today. Socially we are coming more and more to live a common life and industrially we are bound by a vast federation of interests which render war between nations not only wholly improbable but prohibitive. It is no longer true that but one nation of the world can be great at one time; that a nation can become great only by conquering and conquest. The strength of a nation today lies not in fleets and armies. The greatness of one nation today depends largely upon the greatness of other nations. There is but one cause, now, which can provoke a war between great nations. It is the irrational impulse of frenzied passion, excited by sudden insult or accident betraying whole peoples into a mob condition—and advocates of armed peace in the world today should remember that the operation of the mob spirit, in causing war, is greatly facilitated by large armies and navies. The possession of irresponsible power is al-

really a temptation to its irresponsible use. Individual citizens are not permitted to go armed in times of peace. The temptation is the same with nations as with individuals. Instead of being a guaranty of peace, fortifications and armies have become a menace to peace.

The world has shrunk, as it were, into a neighborhood, in which one nation is in constant touch with every other nation. The world's annual commerce exceeds $28,000,000,000 and all nations are vitally interested in preventing any disturbance of it by an important rupture of the world's peace. The most powerful interests all over the world are ready to oppose it. Most of all would they all stand ready to oppose any act of war which might interrupt such an important adjunct of commerce as the Panama Canal will of necessity be.

Within the last six years eighty treaties of obligatory arbitration have been concluded between the nations—our own has been a party to twenty-three of them—for the express purpose of preventing war under any pretext. The social and economical organization of the world has advanced beyond its political organization—and far beyond its military organization. Industrially, commercially, educationally, we dwell in a new world—the world of the twentieth century which has set its face to keep the peace; not thru the strength of its armies and fortifications but by the power of common sense and universal interests. Politically we are clinging to the eighteenth century, still; but is it not the hight of folly to let those barbaric notions of a past age drag us into colossal expenditures and cause us to burden posterity with an enormous debt for no purpose whatever but to satisfy those army and navy mad that we are exhausting the nation's resources and impoverishing posterity in preparing for a war that will never come and which would be far less disastrous, if it did come, if we had not set a trap for it at the otherwise neutralized Panama Canal.

WINONA, MINN.

# The Faded Blossoms

BY EFFIE SMITH

ONE gazed back sadly on his years withdrawn,
The glad, fair, hopeful years that never yet
Had borne the marks of error or regret;
Pure as the page that ne'er was written on,
Or cherry blossoms in spring's tender dawn;
"Alas," he grieved, "life's page no more is white,
Life's blossom now is faded as with blight,
The stainless freshness of my youth is gone."

And yet the tree's true purpose is not bloom:
The white flower withers that the fruit may come:
The page lacks meaning till on it is traced
The deep-lined word; yea tho by blots defaced
If ours be writ with courage and with truth,
We need not mourn the unsoiled blank of youth.

BALLINGER, TEXAS

# 'Longshoring

BY HERBERT D. GALLAUDET

OF course the essence of a holiday is that it's different. It's exciting because it's new; it carries you away because it takes you away—and brings you back another person under the same name.

It is often missed because it is so obvious, scorned because it is so simple. Perhaps the real reason is that most people are too tired and conventionalized to see even something as plain as a nose; they need Mr. Chesterton to show it to them—and provide wild mental adventure in the process. Or else they can merely stumble into it haphazard and by good fortune—as Mary and I did into our holiday.

It was only the other morning—a plain, sunny, ordinary day, just the sort that makes good junket weather any time, windy enough to keep you cool, and hot enough to make you earn your exercise.

We got the canoe on the beach about ten, and under way shortly after. We had no duffle—just the empty bag and a sweater. Of course Mary had some knitting and I a book or two, but the only purpose they served was potential, like money in the pocket when it doesn't have to be used. Also we had a bottle of water and a basket of light eatables—which did have to be used, as I shall tell you.

I shall tell you all about it, because it was so exceedingly simple and such exceptionally good sport—and because you can do the same thing any day if you like to do it—and probably a great deal better.

The tide was just on the fall; we saw the Red Beacon Buoy swing to point east. We took the point; east was where we wanted to go.

We did not know how far; we did not care. Our destination was a matter that at least for some hours could well remain a mystery.

"Sailing under sealed orders?" I asked, as my paddle stepped into the rude

"We'll open them with the sardines at lunch time," answered the Captain, from her post in the bow.

"Plenty soon enough," I acquiesced, picking out our course accordingly; "we're provisioned for as long as that at any rate."

There was a light wind stirring from the south, chopping the water into a thousand fine, glittering fragments in the sunlight, and quartering along our gunnel in jerky little waves that once or twice called for boatcraft. The air was good, of that soft and yet material quality that bright days on the Sound sometimes bring; our lungs jumped at it like hungry dogs, gulped it down and cried insatiably for more. The exercise was easy—if we made it so—mechanical, measured, but somehow quite without monotony. We traveled well, not forgetting the tide.

In a half hour we had slipped thru the islands; they are our usual horizon. In an hour we had rounded the Head; it is generally our world's end.

We kept in shore. It passed with reasonable alacrity; and with very pleasant variety. Point succeeded point; beach followed beach. Reefs dodged up like chickens in a roadway and scattered as quickly behind. The summer settlements stuck close to one another, like true city children at the sea. Woods and groves appeared at intervals, like cattle dispersed in a meadow. Rocky headlands stood out belligerently to bar our progress, like old dogmas in a church creed. Time and tide carried us by. We discovered a harbor—and avoided it. We crossed a bay and took up again the story of the shore.

The morning was getting on. So were we. It was not that we were tired, or sunburned, or wanting a swim. It was simply—ah, yes! at last we realized—we were terribly and tremendously hungry. We were exceedingly happy.

"There are no trees," said Mary, surveying the elected noonplace; "there's not even a blade of grass, not a single

[illegible] to beach the canoe on, it's hardly a real island at all.

"But lunch will taste just as good here as in any other grove of the gods," I rejoined, lifting out the basket. And the sequel immediately proved that I was right—as the male so often is in mere matters of meat and drink.

It possessed all the essential picnic virtues, that little bone of reef in mid-channel, and most of the graces; and yet twenty minutes since we hadn't so much as known of its existence. What we chiefly wanted was a place to stand up in, which our little sliver of a ship scarcely afforded; after that we were prepared—under personal protest—to accept for the moment the loan of a place to lie down on, and for this very purpose the rock welcomed us.

Then bread was good and butter better, and fruit and a cup of water best of all; and a little bit of a rest by no means to be despised—nor too abruptly discarded. The wind blew us cool, the sun baked up comfortable; sky and sea together made us well content.

By and by we took up our journey; the receding shore line claimed us. We had been studying the map; it beckoned us like a flag. And the tide still promised backing.

Of course, there was no particular hurry. One does not remove mountains at half past two of a hot August afternoon 'long shore, nor conquer kingdoms, nor achieve the impossible—nor paddle for big distance. One simply paddles.

The spectacle moved by us as before. Gulls and ships and long lanes of fishing nets, creeks and bays and promontories, beaches and islands and harbor mouths, hills and marshes and bandbox cottages huddled on the sand; an endless panorama, near and distant, like and unlike, almost monotonous and yet very various.

About four o'clock we put ashore. The tide had done its best for us; its hitherto consistent friendliness showed signs of disloyalty and wavering.

"Arrived?" I queried, as we cooled off in the sympathetic company of a grove of walnuts, two bottles of ginger ale, and a visitant Irish terrier vastly receptive of cookies. The last two miles had been hot work, with the wind following, and our entertainment was refreshing. "Arrived?" I asked.

Mary looked eastward. A sand spit ran out to sea, ending in a splash of rocks. A wide bay followed. Far beyond the peninsula gleamed yellow in the afternoon light. Beyond that, we knew, lay the river.

I agreed. We had our sailing papers at last, at least for this voyage; we knew our destination, at any rate for today.

But it behooved us to be up and doing. The tide by now was outspokenly coming in; as like as not the wind would follow it.

It did. Under the lee of the sand spit all went handily. Beyond the point of rocks work awaited us, smiling, pleasant, quite affable, altogether desirable, but Work nevertheless, entirely deserving to be spelt with a capital. We paddled; the distant shore line crawled like a worm. We shifted sides and paddled harder; the yet more distant peninsula drew away from us like a shy, wild thing. We kept on paddling. We encountered cross seas; and survived. We fought the now aggressively hostile tide; and beat it, little by little. We raced the evening shadows that began to pursue us; and for a time kept them behind us. We faced the peninsula—and paddled.

We arrived. The sun told us goodbye. The Sound relinquished us. We carried across the breakwater and were in the river.

It was half past seven o'clock. We were tired—we had come some twenty-five miles. We were also satisfied—we had done what we wanted to do.

"Why doesn't everybody?" asked the Captain, watching the first tentative efforts of the fire I had built on the sands. "Dick, do you know?"

"'Fraid not," I answered, burning my fingers on the coffee pail. "I'm afraid not, Mary. I guess they just can't see it—like us, until today."

"I wish we could tell them," said Mary, sitting by my side to watch the moon rise. "It's been so simple, and such hard work, and so much real sport—'longshoring. Let's tell them. They might all do it—if they only knew."

Which is why this story is written, that would otherwise belong merely to Mary and me.

PINE ORCHARD, CONN.

# The Church as a Social Institution

BY SIMON N. PATTEN

Professor of Political Economy at the University of Pennsylvania.

AMONG the difficulties of the present religious situation is a failure to visualize the difference between the first and the twentieth centuries. Christ came to a disorganized society in which the old barriers to immorality had been broken down. Each nation had a local morality and a distinct religion which kept its people within bounds and was the source of their vigor and continuity. The crushing power of the Romans broke this down and the intermingling of races loosened the ties that held people to earlier customs and usages. There being no social institutions commanding respect, a general looseness of conduct resulted. Christ brought order out of confusion thru a new morality and a new religion. His morality was the law of love; His religion is the doctrine of a new birth. These two basal thoughts were emphasized so often and so firmly that there can be no doubt but that he meant to build His Church on them. Ideals must have measures of their realization and means of their attainment. The measure of the growth of peace is morality; the means by which it grows is love. The non-resistance of evil, the disappearance of national hatreds and the blending of the nations of the world in one kingdom are parts of this one ideal for which the Church sought to found social institutions.

If we shift the viewpoint from the first to the twentieth century we see how much has been done to make the law of love effective. While it is still too often the fact that the peace of the world is broken, yet institutions, societies, moral and legal codes have gradually brought order out of chaos. On its ethical side, Christianity has been a success, but it does not follow from this that the Church of today should become an ethical institution. The Church is not the one organ of Christianity, as it was in the first century. It is now one of the many Christian institutions, each of which had its origin in the mother Church, but which now has an independent organization, makes its special appeal and would persist even if the organized Church disappeared. If the Church deserts its religious platform to become an ethical institution, it will gradually become merged in the social institutions that have ethical progress for their end. The school would be the place where morality is taught; the university would increasingly become the standard bearer of culture, the family would enforce and elevate the law of love; the state would protect from aggression and extend international law. All these institutions have been devised by Christian nations to uphold and extend ethical ideals. Christianity is a force, not an institution; it will continue to thrive so long as any group of institutions exist to make it effective. Should we let the Church go and act thru them or should it be reconstructed so that it complements what is done in other ways? This is the great problem of the twentieth century.

A second problem is the relation of social reconstruction to social advance. The mechanisms securing results in these two fields are radically different and create a demand for peculiar institutions. Progress is one of the great social ideals; its measure is invention and discovery; its means are science and economy. In these ways institutions are being developed that make discovery more certain and rapid. To them we must look for the increase of knowledge. The Church cannot compete with social institutions either in the field of progress or of ethics. This does not mean that Church leaders should lose interest in the social advance of their age. It does, however, imply that the Church must have some special contribution to make and some program for the success of which it is responsible.

The Church has and can have no rival if it keeps its religious program in the

foreground. The new birth, regeneration, social justice and an impulsive opposition to oppression have a common thought and a common remedy. This thought is that men tend to sink below their maximum ability, and need supermaterial motives to arouse their full powers. Progress looks to something beyond man to which it wishes to elevate him. A superman is its goal and the increase of knowledge is a means to this end. Religion, on the contrary, evokes what is in man by bringing him into contact with spiritual as well as material forces. The new birth manifests itself not in knowledge, but in activity, and thus brings every part of the man into an effective co-ordination. If there were no material forces pressing men down there could be no regeneration to revive what has been suppressed.

To predicate social degeneration does not, however, assume a lack of social progress or even that the average man is below the level of his ancestors. Progress is made by the few whose social position frees them from the pressure to which the masses must submit. One part of society moves up and becomes an agent of progress but another part sinks through the agencies that progress has created. One man makes a great invention of which all are proud, but the invention applied to industry creates a thousand mechanical positions that lower the intelligence and vital power of those who occupy them. A hundred thus sink to lower levels to a dozen that are elevated by the change. It is a modest statement to assert that the benefit of modern industrial progress has gone to a quarter of the people affected by it. The masses have lost their contact with nature, have been forced into mechanical occupations and live in congested cities with no upbuilding influences about them. Even the churches desert the crowded parts of cities and confine their ministrations to the minority who have income and position. Unless material benefits can upbuild a race, the working population losing their vitality will sink into a mechanical existence in which no evoking powers stimulate their full development. Progress gives little relief because its mechanisms chain humanity to a routine that kills the spirit in men even if it fills their stomachs. It is easy for a clergyman in the suburbs or in a country village to talk of progress and write sermons about the uplift which his particular class or locality is undergoing. But if he seeks to stem the tide that sweeps the masses downward, he will find that the rosy pen-pictures he so fondly created have no counterpart in the world about him.

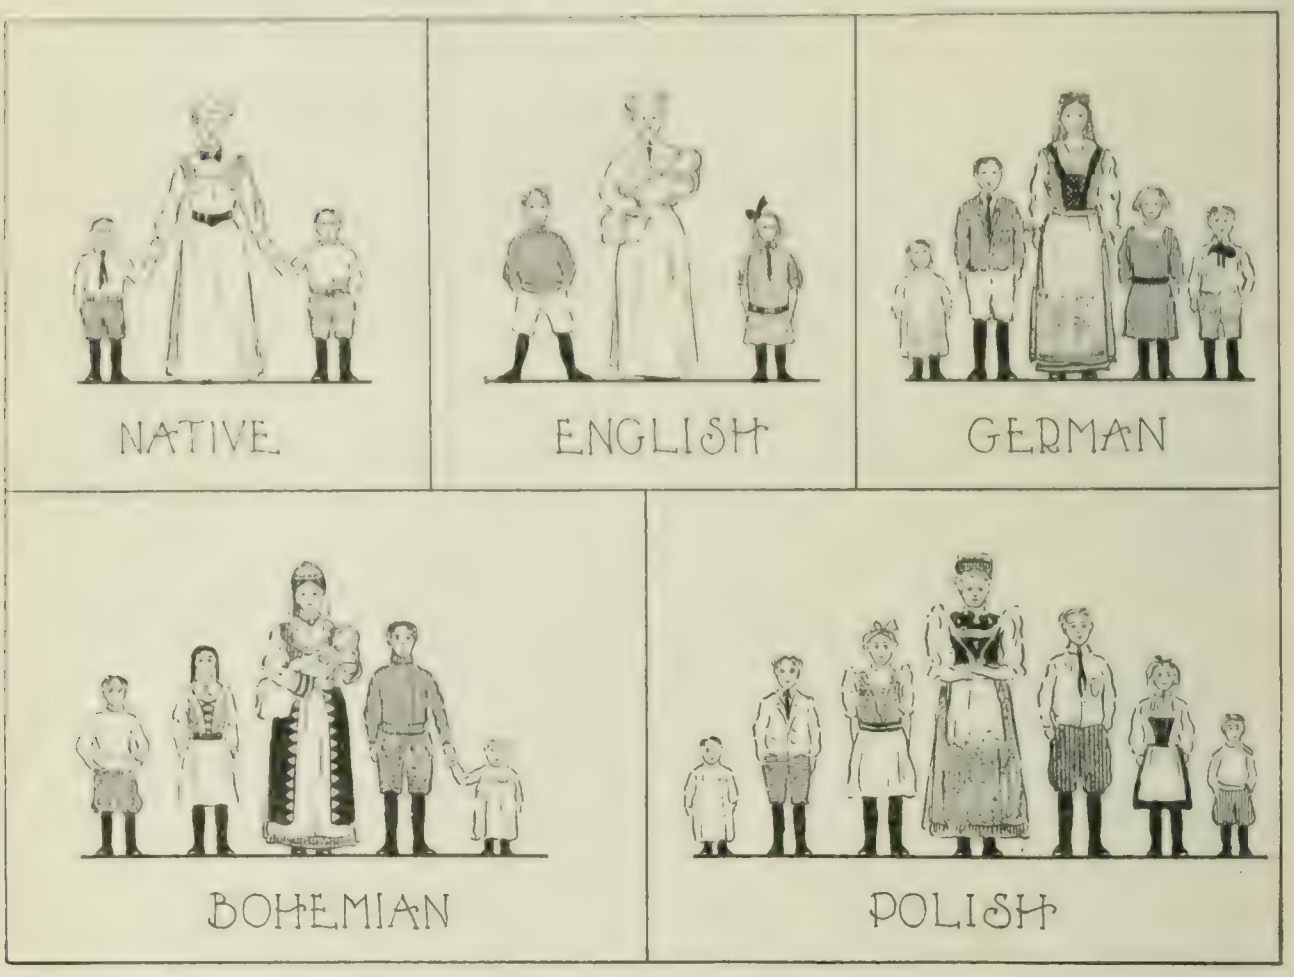
Degeneration is not a new thought but merely a new name for the depravity which every religious leader has tried to combat. It forms no more fragile basis for religion today than it did when Wesley or Luther faced the same tendencies and for a time counteracted them. Religion has been an intermittent force breaking forth at times into vigorous reaction against vice and then sinking into long continued slumbers charmed by the sophisms of ethics and progress. By themselves, ethics and progress have never been able to resist the tendencies that cramp and depress the masses. In the end a religious awakening had to come and the uplift that followed revived the spirits of men enough to start a new epoch of material progress while religion once more slumbered for lack of great leaders and a definite program.

Perhaps degeneration is too strong a term to convey the truth that religion emphasizes. For fear it may seem that the downward tendencies are not important because subsumed under a single name, I shall restate my position from a varied instead of a single standpoint: Some of the evils are merely depressive but if long continued any depression becomes degeneration. Heredity furnishes the basis and gives the direction to growth but no part reaches its normal size without the stimuli of use. An arm or a leg would be a mere dwarf if constant exercise did not stimulate growth. If the stimuli that arouse growth are absent, both mental and bodily powers are reduced. We call isolated country people boors, and find overworked city laborers stupid and listless. This is not because they have a different heredity from ourselves, but because too little has come into their lives to arouse them. This lower level of psychic life is a great obstacle to a religious awakening. The overworked man has not the energy demanded for a new birth. He eats, works and sleeps, repeating each day a round of

weary tasks with no great stimulus coming into his life to transform it. He must be freed from the routine and the depression of overwork before religion has an opportunity to evoke his better self.

A second and severer form of degeneration also has a biologic background. Each child in its development goes through the stages that its ancestors passed through in their development. If the conditions of growth are unfavorable, the child fails to go through some of the latter stages of development. Bodily powers are thus diminished and many mental traits fail to appear. Criminal traits are old traits made dominant through the lack of normal growth. If all men had a normal development we might still have vice but we would have little crime. The law of love is the law of the normal man. The law of hatred and animosity gets a supremacy only when hardships retard growth and give at maturity a dominance of atavistic traits. Such people can be moved neither by ethics nor religion. Misery, misfortune and poverty crush the spiritual. The worst sufferers are the children. Their growth is stunted not only by undernutrition but also by the labor imposed on them by the poverty of parents. To them the evoking power of religion never comes. Retardation like regression kills the spirit, maims the body and cramps the mind.

A third form of degeneration we think of as dissipation. When a man says he can smoke or not smoke, drink or not drink as he wills, we are likely to think that it is merely a resolution that decides what he will do. There is, however, more than a volition involved in his decision. Dissipation results from the misuse of some stimulant or food. The overnutrition that follows clogs the system and creates toxins that poison the blood and reduce the vitality of the user. His mental vigor is thus lowered and his moral freedom is not real because the physical background through which the will acts has lost its efficiency. Thus it is plainly a degeneration. Overnutrition is as dangerous as undernutrition and has as definite marks by which it can be recognized. If men prosper they dissipate. If they lack income their children are retarded in development and deficient in vigor. There is so narrow a margin between overnutrition and undernutrition that few maintain the equilibrium between them. Degeneration from one cause or the other is so prevalent that society would sink if counteracting agencies were not formed by the emotional reaction religion evokes.



It is this degeneration that creates the contrast between social advance and social reconstruction. Progress demands social institutions of a different character from those effective in remedial work. Into which of these groups does the Church fit and in which direction shall its efforts go out? I believe Christ's reply would have been clear and simple if the religious situation of the twentieth century had been before him. His ethics as the law of love has been cared for by the various social institutions that have grown up in connection with modern civilization. They are as much a part of Christianity as is the Church itself. The Church can thus intensify its religious activity and provide the remedies to raise the lowly into the normal life of the communities of which they are a part. The true ideal of religion is salvation, its measure is regeneration and the means to attain it is social service. Regeneration denotes the evoking of dormant powers; social service is the aid that the prosperous and strong give to those crushed beneath the burden of overwork, poverty and vice. It is a movement of human energy not towards an adjustment that would aid themselves, but towards the classes below them who cannot return in kind the aid they receive. Whatever unifies mankind, whatever rids men of vice and misery; whatever frees them from fear and want; whatever takes off the pressure of overwork is religion. These changes will never come thru progress. They come thru service that reaches down and not thru self help that moves upward. Religion offers not a consolation for the ills of this life but a remedy for them. If the Church gives us God thru its worship, social equality thru service and social justice thru resistance to exploitation, it will always have a place among social institutions and be second to none in its power and influence.

# The Size of American Families

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy at Yale University

MUCH has been written during the last few years concerning race suicide in this country, and the observation has been quite general that the size of family among the Americans of native stock was smaller than among the foreigners of the first or second generation in this country. Information upon this subject was gathered for the Federal Census of 1900, but no use was ever made of this material until, in 1910, the Immigration Commission was given access to the Census schedules. The recent abstract of the Immigration Commission upon the fecundity of immigrant women gives us therefore the first information covering a large number of cases which has ever been published. It was impossible for the Commission to cover the whole of the United States, but certain districts were selected in order to compare the fecundity of the married women of different nationalities in urban and rural districts. The investigation covered the entire State of Rhode Island, Cleveland, Minneapolis, rural Ohio, and rural Minnesota. Only those married women were included in the study who were under forty-five years of age and had been married from ten to nineteen years. The result showed that for the total area tabulated there were 2.7 children born to the native white mothers of native parentage, and 4.4 children to the white mothers of foreign parentage.

In Minneapolis the number of children born to native mothers was 2.4, and in rural Minnesota 3.4. The number of children to mothers of specified foreign parentage was as follows: English, 3.4; English-Canadian, 3.5; Scotch, 3.6; German, 4.3; French, 4.3; Irish, 4.4; Norwegian, 4.7; Italian, 4.9; Bohemian, 5.0; Russian, 5.4; French-Canadian, 5.6, and Polish, 6.2. The statistics also seem to show that the native women of foreign parentage have a lower fecundity than the immigrant women of the first generation.

# Mexico's Future

BY CHESTER T. CROWELL

ON the night of last September 15 Porfirio Diaz stood on a balcony of the National Palace and rang a little bell in commemoration of the occasion, one hundred years ago, when Hidalgo, the patriot priest, called his little group about him by ringing the bell of the parish church to set on foot the revolution which resulted in freeing Mexico from the yoke of Spain. On the vast zocalo in front of the National Palace stood probably 100,000 persons. Within the palace was a scene of brilliance which attested the sturdy national life of the Republic of Mexico. Diplomatic representatives of every civilized nation were present. When the bell rang the air was rent with cheers.

Looking from a window I saw a vast sea of heads and suddenly there was a movement among the crowd and a little group of men, moving like a serpent thru the swaying mass of humanity, could be discerned following a crude banner on which appeared a picture of Francisco I. Madero. They yelled, "Viva Madero." In a few minutes they had neared the edge of the crowd and the Mexican Rurales were slapping them with the sides of sabres and driving them in all directions. Many persons laughed at them. I felt very sorry for them, for I have seen other revolutions in Mexico and always some persons with more patriotism than judgment either faced a firing squad or went into dungeons in the prison of San Juan de Ulloa near Vera Cruz. Mexican revolutions have been frequent ever since there has been a Mexico. I have seen revolutions start with much better promise of lasting six months than did the revolution fomented by Madero.

The end has come and we have read in the dispatches how Porfirio Diaz, nation builder, warrior, financier, statesman and tyrant, rode out of the capital of Mexico one rainy morning, seeking the unfrequented highways and nursing an ulcerated tooth. He is not only defeated and an exile but ill. It seems that fate becomes theatric on occasions like this and plays her part to the last detail, forgetting no incident that the dramatist might wish.

Diaz didn't think the revolution could possibly win, nor did his Cabinet, nor did the people who know Mexico. Many who were in sympathy with it didn't dream it could win; those who guessed wrong about the outcome of this revolution are in the majority. The Government made the mistake of thinking the very name of Diaz was invincible, and for the first time the Government was pitted against revolutionists who had money.

There is every reason to believe implicitly that Diaz speaks out of his wisdom and the love of his people to whom he gave a life time of service when he says that he gave up the Presidency to avoid a long and bloody war, for no man knew better than he how imperfect his work had been and how far it is from completion. He knew that only the ever vigilant Rurales kept the highways of Mexico clear of bandits—bandits whom Madero called into the revolutionary army and the men with whom he is now having trouble. Diaz knew his Government was a tyranny, nicely glossed over with a semblance of democracy, and he was struggling with all his strength to put in the foundation stones of education and commerce and prosperity. No man knew better than he how much the foreigners own in Mexico and how great a factor they are in the education and progress of the country. He didn't want to see them frightened away nor to have his country embroiled with foreign nations because of destruction of property.

Think what a peculiar division of the country has resulted from this revolution! In the southern part of Mexico are many revolutionists who do not know Madero. They fought, not for what he preached, but for what they always believed, and they welcomed him thinking he was their sort of a revolutionist. Lower California is struggling

to maintain a Socialist Republic independent of the proposed new Government and maintained principally by Socialists from the United States and other foreign countries. When I saw the heterogeneous mass of combatants arrayed against the Government I predicted they must fail, but their leader is now the dictator of affairs in Mexico, and it remains to be seen whether he can save Mexico from the maelstrom of his creation, or rather the subdued maelstrom he has loosed. Knowing the limitations of the Mexican people, Diaz advised the new leaders that they will eventually have to rule as he ruled. Conscientious and well-informed Mexicans fear he is right and earnestly hope he is wrong, but Madero is absolutely convinced he is wrong and therein lies the ground for calling Madero a dreamer. Moreover, he stops to ponder and shows himself unable to decide questions without delay. His military campaigns were conducted in the same uncertain manner. Dealing with people like the mass of the population of Mexico, one must decide quickly and then "stick to it." Porfirio Diaz never failed to do that even tho it involved ordering soldiers to fire upon the citizens.

The causes of the recent revolution were numerous, but the dominant cause was the desire of many of the people to vote, and that is going to be the phase of public opinion with which the present Government will have to struggle most. During recent years the Associated Press has furnished to the *Mexican Herald* and the Mexican newspapers reports of world events. Now that I think it over, I am impressed with the recollection that there was a startling and phenomenal interest down there in the last American Presidential campaign. Those people read about what Bryan said and what Taft said and about debates in Congress and it impressed them as it never had before that things are different in their own country. They want to vote and they want their public officials to make speeches explaining what they are going to do. But the fact remains that the people of Mexico—that is, the mass of the people, considered collectively—haven't sufficient education to pass upon public issues intelligently. I do not think they can ever exercise sufficient restraint not to shed blood during a heated political campaign. They run off on tangents; even religion will be dragged into politics and strong foreign interests will be endangered during campaigns. It is a most serious situation.

But the Mexican people are now going to have a chance to vote. The world will await with interest the result of their experiment next October. I positively know that it was the ambition of ex-President Diaz to bring his people to the state where it would be possible for them to elect their own officials. He wanted things that way, but he didn't think it was as yet safe to try it. Madero believes as firmly as he believes anything that the people of Mexico are sufficiently intelligent to vote. It is almost astounding how sanguine he is.

When one thinks it over, however, it must be confest it is the optimists who do the greatest things. One should not be pessimistic about Mexico, after taking into consideration what wonders have been wrought during recent years. Perhaps newer and even greater wonders can be wrought. At least one must go into the water to learn to swim.

The people of many of our own Western and Southwestern States have, at various periods of their history, been so ignorant that their attempts to maintain popular government resulted in bloodshed. The history of this country tells very, very plainly of the woful ignorance of many of the voters. There is this difference, however: the American people have an instinct for self-government. Be they ever so ignorant it is almost certain that somewhere in their very recent ancestry will be found scholars. The pioneers merely fell away from the old-established order of things for a brief period. The Mexican people are descended from Indians who had absolute monarchies and Spaniards who lived under an absolute monarchy. The Mexicans bore patiently the yoke of Spain not for a few years but for centuries and they never have had a democracy.

But if ever a people entered with enthusiasm into the effort to obtain true democracy the Mexican people now have. They lack experience and knowl-

edge and education, but they know what they want and modern history does not record an entire nation with greater singleness of purpose or greater enthusiasm.

There will be blood spilled in Mexico for several years; bandits must be suppressed; counter revolutions will crop out and intrigue and plots will be rife.

First among the causes of trouble will be the forthcoming election. It remains to be seen if Madero can keep his present acknowledged leadership as the idol of the masses. Bernardo Reyes will be a very formidable candidate. He was the idol of the Mexican people when he was sent away to Europe last year to study military tactics, and his followers are not yet scarce. Without any effort on his part the people had about started a revolution to make him Vice-President in order to be sure that he would succeed Diaz. He has been popular for years. Madero is more of an accident of history. A practical, hard-hitting sort of man like Reyes suits Mexicans better. Reyes is also strongly anti-American, which is unfortunate. Such is the American strength in Mexico now, however, that his anti-American sentiment would not be likely to be very effective. If these two men enter the race it will be a spirited and turbulent campaign.

One of the coming men of Mexico is Francisco Leon de la Barra, a fine type of the progressive and fair-minded Mexican produced during recent years. His future is bright.

The story of some of our struggles for democracy is written in blood and so will be written the story of Mexico's struggle. But a strong nation united by democracy is stronger than any tyranny. The future of Mexico appears unsettled but in view of what has been done in very recent years it is not dark, nor are leaders of wisdom and patriotism scarce.

Austin, Texas.

# The Difference

BY FRANC MANGUM

Only a few more notes, only a finer tone,
And lo! the world bows down before the singer's throne.

Only the same old thoughts clothed with a sweeter sound,
And lo! a poet's brow with laurel wreaths is crowned.

Only a keener ear, only a swifter skill,
And lo! the artist plays on human hearts at will

Only a tint or line, only a subtler grace,
And lo! the world grows mad over a woman's face

Yet tho so slight the cause for which men call us great,
This shade the more or less may fix an earthly fate.

For few may wield the power whose spell enthrall and thrill
The barrier, fast yet fine, we may not pass at will.

# A Prosperous New Hampshire Farmer

BY W. A. CURTIS

THE town of Coxeter, which isn't its name, is in the middle of New Hampshire. Some French king asked some French admiral what sort of a country Hayti was and the admiral crumpled a piece of paper and threw it on the table saying, "There, sire, is Hayti!" An idea of the relief of Coxeter could be given in that way. Coxeter is tall, precipitous hills, rock-strewn, ledge-bound, and stone-stuffed, and deep, dark vales in which trees grow with tropical luxuriance. "Why, an East Indian forest is not more dense and abounding in vegetable vitality," exclaimed a man who had just returned from Asia. Measured by their actual hight instead of elevation above the sea, the hight from base to summit, the hills rank about with the average Montana mountains and would be respectable, even in Colorado. I think I was one of the first to discern that my ancestral New England mountains are not much inferior in actual hight to my native Rockies. A ten-thousand footer in Colorado whose base is six thousand feet above sea level is no more imposing to the eye than four thousand five hundred feet New England mountains whose bases are five hundred feet above the sea.

One would naturally expect Coxeter to exhibit many abandoned farms. It has but 182 inhabitants this census and had 243 in 1900. Its population before the Civil War is locally said to have exceeded 500 and when you pass six old cellars in unbroken succession and then four unoccupied houses, you believe this. Houses held more children then, too. The present farmers are divided into poor whites; farmers who work hard, but win only a meager living; and farmers who would be accounted prosperous even in the West, who live as well and make as much money as well-to-do farmers in Wisconsin, Illinois, or Missouri. The poor whites, who in appearance and even speech, seem to be of the same Appalachian genus as the Southern poor whites, like their Southern brothers are on land where it is almost impossible for any one to make a decent living. It was one of the discoveries of the bureau of soils that the poor farmers were on the naturally poor land, thus exploding the belief that the Scandinavians and Germans of the Central West are inherently superior to the Anglo-Celts of the Southern mountains—merely men on rich arable soil and men on stony, poor soil, the latter afflicted with hookworm into the bargain. Some of the soil in Coxeter, full of stones tho it is and once covered with boulders, is very rich and heavy crops and splendid grass grow on it. A few farmers are making money and show that New England is not yet played out. We are still Yankees on the farms of Vermont and New Hampshire, and there is still hope for us. I sometimes wonder if foreigners are so numerous in the rural districts of other States, as many seem to think. A writer in the *Review of Reviews* within a few years stated that 84 per cent. of the New England farmers are of native stock. Some of the other 16 per cent. must be of British and Canadian birth.

Upon the rounded top of one of the tallest hills in Coxeter, which is also the broadest, lives Andrew Sanborn, which isn't his name. Here he has fully one hundred acres of gently sloping open land, tho the rest of his domain, some three hundred acres of forest and pasture, lies on the steep slopes of the hill. It is a hard pull to get up there, an almost steady climb of three miles from the river. As Mr. Sanborn could not say it for himself, I will say that he looks like a chief-justice and uses the best English and that his daughters are handsome, refined looking women, while his two sons, when they drive to town, might be taken for college students, noticeably well-dressed, fine-looking fellows. Tho not college men, they are graduates of one of the famous fitting schools of the State. Now let Mr. Sanborn speak:

I was born on this farm sixty-three years ago and save for the one year I

spent in the army during the last year of the war, I have lived right here. The population of Coxeter was thrice what it is today the year I went to war. There was no village in the town, any more than there is today, but we mustered 500 souls, a fair average for an agricultural town of our area in most parts of the country. We were not exactly a new community, for the first settlers had come before the Revolution, but we had the feeling and characteristics of the new towns of the West, characteristics which I hear the older West has lost now. We had social life. It almost seems as if old communities, like old people, lost their enjoyment of society, their social genius, you might say. I have a cousin who is an Illinois farmer and he tells me that now, even the Germans in the country no longer have dances and that German farmer girls no longer expect as a matter of course that they will get married. There were a lot of children in the district school and we visited back and forth. There was a spirit of life in the air that prevails at all times when "things are doing." You feel it in haying time even now, in the woods when we log in winter and in a saw mill. We felt it all the time then. The community was advancing. A few persons left each year, but they were our surplus. New houses, new barns were going up. People were doing well. We had enough to eat, enough to wear, tho even then we didn't have much cash. Barter has always been the curse of New England agriculture and a prime cause of its decline. The storekeepers are too hopelessly short-sighted to see that the farmers would be incited to greater endeavors if they could get money, would spend it in the village and help build it up for the storekeeper's advantage. You see, while we can do business with the grocer, we can't with the furniture man. We can't barter potatoes to him for carpets, for he can't sell potatoes. But if we brought him some of the money the provision man paid us, he would have more money to buy of the provision man. I sometimes wonder why the keepers of the kinds of stores that do not handle our produce, do not in self interest try to get the provision and general store men to pay money instead of barter. It isn't entirely isolation and hard work that makes people leave the farm. It is partly because it seems good to feel some real, hard money in your pocket and be able to buy a book as well as take boots in barter. In building our houses, we didn't feel the lack of money so much as in other respects, for every farmer cut his own lumber in his own woods and did a lot of his own carpenter work.

But we were better off in my boyhood, not merely by comparison, but actually. We actually had more money. For instance, the railroad used to burn wood and paid $5.50 a cord, not best quality wood, either. It cost much less to get out your wood then and a dollar went farther. To-day, if we hire a man, he has to have $1.25 a cord for felling trees and cutting into four-foot lengths and after we have hauled it to the village, we get $4 a cord for first quality wood, sometimes wait for our money and sometimes don't get it at all. Railroad used to buy all we could furnish. We sell only a limited amount now. The only way I can afford to sell wood is to load my ox cart with wood when I am going to town for grain. In that way, I don't go to town empty. The price of stove wood wouldn't justify the work of preparing it and hauling it the distance I have to haul it. We used to raise sheep, hauling wool to the mill in Bampton. I went there the other day around thru the Black Mountain notch. How many families do you suppose lived on the notch road in my boyhood? Sixty. Mose Hall's folks are the only family left. Why, on that thirteen-mile stretch, there were sheep and cattle counting up into the thousands and now only trees there. Wool was mighty profitable right after the war. Father once sold 2,000 pounds for $2,000. I can't tell why we New Hampshire people stopped raising sheep. Dogs, they say, but that's no reason. The country is more thinly settled and it is easier to get a pasture at a long distance from dogs. The Bampton mill is still in operation, using foreign wool, of course, making good cloth, some of it of a distinctive, unusual weave. A few are going back into sheep and it looks as if the State might again do something in this direction. Simpson has one hundred and fifty now and Ray and Dawson

each have fifty new flocks. Sometimes I wonder why men of capital don't buy up a lot of these old farms and turn them into sheep ranches. A lot of the necessary fencing is already here in the shape of stone walls; never have to be replaced. The old barns would shelter the sheep and the houses give homes to the herders. Probably some smart Montana man, driven off his range by incoming farmers, will try it here where the farmers are outgoing. Wool, hogs, and cattle were our cash products in the old days, tho we sold few cattle. New England is a dairy, not a meat country. New Hampshire is behind the other States in cattle. Poor breeds and the farmers let the heifers have calves when they are too young; stunts the whole herd in time. Potatoes were too low to be worth much to us in the old days, tho on the other hand the plant didn't have bugs and blight, as at present. We were great rye eaters, which they say is the sign of a poor country. But we all raised wheat, too. Wheat ran 12 bushels to the acre, which seemed small compared to the yield of the virgin West, but it is three bushels better than the Red River of the North Valley is doing now, out there in North Dakota. We can't raise grains for flour now, for the old flouring mills are all gone. The nearest one is 96 miles and the only one in the State, I think. We raised more of our food and made more of our clothes and tools, than will ever be possible again.

I married at twenty-two. The other house there, the vacant one, was the homestead. I use it for a carriage house and granary, now. Our present house was built for me. Father and I with a little outside help built it. We ran the farm together. Some of the money I got for wood sold the railroad, I put into railroad shares. It was the old Boston, Concord & Montreal, now leased by the Boston & Maine. I bought shares for $10 and for many years now they have paid $7 annually a share. It was a blow to us when the railroads began to burn coal. The potato bug got here then. The population of the town had begun to decrease. California, the Middle West, and our own manufacturing towns were taking away people. The more people went, the more other people wanted to go. In a way, it was a sort of fashion, the thing to do, this going away. A young fellow who was going away, felt important, was important. Take Scott Anson, down on the river. Jim Hen Perley was engaged to Fred Joe Braley's daughter Sue Ann. Scott was going to California. Jim Hen was going to stay in Coxeter. What did Scott do but steal his girl and the first time Jim Hen knew she didn't intend to marry him was the day he heard she had married Scott and left for California. They went and came back. Lots have come back. Stevens lived in Wyoming. Nichols lived in Idaho, Spiller in Minnesota. Hazen tried Kansas and Samuels tried Nebraska. Grasshopper times and both gave it up. Perry went to Louisiana and Linthicum went to Missouri. Queer what a lot of New Hampshire farmers there are who have come back from other States. If the emigrants had all stayed away, it would be quite a chunk out of our population. But a mighty sight of them did not come back. It makes a chap feel lonesome to drive to town these days. Latimer's house is a city man's summer place. Gray's house is empty. So is Le Blanc's, only French family and non-Yankee family that ever lived in the town. The old Dan Sylvester house is in ruins. Fine farm, that, and the Dorman brothers cut a lot of hay on it now. They must have 1,600 acres of old deserted farms and they are getting well off. Came from Chicago, tho their parents were Littleton folks. Work themselves, early and late and are making money. Educated people and they can shoe a horse, throw a steer, set a tire, just the same. Next two houses are empty. Then the bu'sting big old Burton house and its huge barns. Burton's wife inherited $100,000 that her father scraped together on that hill yonder and they live in the village winters. Echols's place is empty except in haying, when Echols comes over from Harwich, five miles, and cuts the hay. The Porter brothers houses are occupied now after being empty ten years. This gets you to the top of the big pitch down to the river valley. It makes you feel bad; sort of takes the spirit out of a man to drive down past all those houses, big old houses and big old barns that used to be

full of children and cattle once. The Yankee did something once. The Yankee storekeeper squeezed the Yankees out of the farms just as the Yankee mill owner by paying too small wages for a man who can read and write to marry on, has driven the Yankee breed out of the mills and out of existence. Sometimes they say the Yankees, the town laborers, have run down. What happened was that the strong, ambitious, and prudent didn't marry and the sick, weak, and careless did and folks point to their children as examples of degenerated stock. The sturdy Yankee didn't degenerate—merely died out. The same thing has been happening to the New England Irish for some time and is beginning to happen to the French-Canadians here. The French are being driven out of the mills by later and in my opinion, inferior immigrants. The French are a manly people. They are brave and fight fair. You never hear of them sticking knives into any one. In the end, the French and Irish are going to get it worse than the Yankee did, for a far larger portion of them are in the towns and in factory work and fewer of them are highly paid artisans. After all, you can't use unskilled foreign labor in everything. Our local mill owners, over in Harwich, are after Yankees again. Say they work enough better to justify higher wages. Yes, the New England village Irish are dying out. When I was a boy, there were nine Irish families in Harwich, lots of children in each family. There are only eight representatives of those families now. Four of them are grandchildren, all over twenty. Only one of the four is married and she is half Yankee and married to a Yankee. Consumption got many of them, others didn't marry—just didn't marry. A Vermont doctor tells me it is more marked there than in New Hampshire.

Sometimes people say that the New Hampshire rural districts will fill up again, either with farmers or city people, or both. City people are buying up old farms and they will be a factor. Some of them keep men on the place the year around and that means a genuine return of the farm to production. But most of them merely live on the farm summers, raise very little and board up the house when fall comes. The capacity of city folks to absorb the farms, seems to me to be overestimated. Many who have money enough to buy places, can't get away long enough. This township has thirty-two square miles. At 160 acres to a farm, which is too large by a good deal, that would give 128 farms in the town and the county would have 5,120. At four persons to the family, that would take care of 20,480, quite a chunk out of the population of Boston. I have no data upon which to base an estimate of how many people in Boston can afford to own a summer home. You must subtract, too, from the possible owners of farms those who choose a seaside cottage instead of a farm and those who want to travel from place to place, who do not want to bother with the question of help in the country and so on. The census of 1910 shows the New Hampshire farm population has decreased by 5,200 since 1900. It is undoubtedly true that much of the land that has been abandoned ought to have been abandoned before it was taken up. There used to be six families on Pickéd Hill. All gone and why anybody ever tried to live on such a place, I can't see. Awful place in winter. Wind hits Moosilauke for the first time on its way from the North Pole and strikes Pickéd Hill for the second. The influence of winter is not given consideration enough in discussing the abandoned farm problem. These hill farms are all right in summer, but the drifts and winds of winter shut them in. More abandoned farms on north slopes than on south ones. I read awhile ago that the trend of emigration was now toward the tropics. I notice that people talk against winter more and more. We used to think it was good for you, like bitter medicine, physical and moral discipline.

As I said, many abandoned farms ought not to be cultivated. We have some very poor people in this town. Garr lives on a regular sand bank. Works hard, plans, saves, and is quite a thinker, but poor. Hillman lives on a rock pile. Place as neat as a pin. His son manages to get enough to wear a collar and necktie even when driving an ox team, but they're poor. Joe Hanley is another collar and cuffs farmer, tho

not poor. Drives a load of boards over to the Coxeter siding and nobody to see him except maybe Henry Vincent, also loading boards in a freight car, and Joe has on a white shirt, collar, black tie, and cuffs with the buttons his grandfather had when he was minister to Greece. Joe remembers that, tho other folks seem to remember better that his other grandfather stole sheep. Garr and Hillman haven't all the rocks, to be sure. Everybody has them to spare. You are never quite sure whether you are farming or quarrying in this town. But I don't see how some of us live. It takes a shrewd plant to find its way up thru the stones on Hillman's place. I suppose city people wonder how I live. I don't mind telling you my schedule.

I raise 600 bushels of potatoes a year, ship them early to an honest grocer in Manchester, getting from 75 cents to $1 a bushel, money. I keep four horses, all too light for heavy work. I sell a colt every two or three years for $150. I have forty cattle, some of them calves and heifers, six of them grown oxen. I average $20 a week from this herd, from the sale of some of the calves and from the butter, part of it sold for cash to private families, but most of it sold at stores for barter. As I buy all the grain these cattle eat, I clear about $12.50 a week. I have about a dozen hogs to sell each year and tho they have netted little in some years, they are going to make me money hereafter. The grain bill is a big set back, but I have the small potatoes and poorer apples for them and I raise some corn, fifty or sixty bushels. Last hog I sold brought $43. I get about $25. On pork, we get the full price. Western price, plus freight, get eight cents a pound when Chicago is paying five and a half. I annually sell twenty cords of stove wood at $4 a cord and another twenty cords of white birch for shoe pegs and bobbins at $7 and $8. I haul a little pine and a little popple every year and get about $200 for it. How much is that? Somewhere around $2,000. Wouldn't attempt to make an exact addition. I sell a few apples, an occasional cow and other things. But I wouldn't reckon them in, as they only offset the deficiency in the calculation caused by lower prices for potatoes some years, as during the last two, when I have sometimes sold for fifty cents a bushel. There is quite a bill for chemical fertilizer and I have to buy appliances. I haven't much machinery. Have to depend upon hoes a good deal in such stony land. Potatoes, you see, are about the only crop for which I stir up the soil. The rest is principally hay. Using oxen, the bill for renewing harnesses is saved. I am using the same ox bows father used. Oxen are slow, but you can harness them in far less time than horses, on account of there being no harness, and that helps make up. Their grain bill is low, they are perfectly reliable and for lumbering, they are the only animals. Anyway, I couldn't take horses down these hillsides in front of loads in winter. My oxen are all trained to step fast. It isn't necessary to let oxen creep. My income is not the only thing to take into consideration, for with a farmer, the principal part of his living comes from his place. The smallness of my outgo is as big a factor as my income. I have no house rent, no fuel bill, no water rate, low taxes. We do not need many clothes. The butcher is a man we have nothing to do with in winter, eating our own beef, pork and chickens. In summer, part of our meat bill is saved by poultry, corned beef, salt pork, ham and beans. We have all the meat that is good for any one and possibly more and raise most of it ourselves. We sell no hens, raising only enough for ourselves. We eat our own apples and berries, preserve some, have our own jelly. We eat a good many potatoes and that reduces the flour bill. No butter bill, no milk bill. Yes, I have invested some money every year and I could retire and go to the village and live comfortably on my income. But I can do a good day's work with any of them still. It's an old man's country, New England is, for men last a long time here. The farming districts are a long time dying, because the people are. There is a big sight of old men running the farms, tho, and sometimes I wonder if the next census won't show a worse decrease than 5,200 here in New Hampshire. A lot of us are right on the edge of having to quit. Grey-haired men are doing a lot of the farming that is done in these grey-walled fields.

ASHLAND, N. H.

# Will There Be a Revolution in China?

BY THE REV. CHARLES BONE

[This view of the political crisis in China is of unusual value since it is based upon the constant reading of the native newspapers and a life-long association with the people. Other articles on the subject by the same author appeared in THE INDEPENDENT, August 15, 1907, and May 13, 1909.—EDITOR.]

THE recent revolution in Portugal has suggested to many of the Europeans and Americans who have resided during many years in the Far East, the pertinent question as to the probability of a revolution in China. The suddenness of the uprising and the swiftness with which it was consummated have furnished an object lesson to the progressive Chinese, who have brooded long over the humiliations to which their country has been subjected at the hands of foreigners, and to the wrongs the people have to submit to at the hands of their own corrupt officials. The immediate acquiescence of the Portuguese in Macao, a colony at the very doors of China, in the sudden transformation of their monarchy into a republic also furnishes an object lesson quickly learned and easily remembered.

We are familiar enough with the parable of the new wine stored in old wine skins, with the inevitable consequences. During the last ten years a good deal of "new wine" has been imported into this ancient country. The untrammeled activities of Christian missionaries have introduced many new ideas, which cannot but rouse the latent energies of restless minds. The sacredness of the individual; the equality of the sexes; the privilege which all have to worship the same God; the concept of the one God, who at the same time is the Creator and the Heavenly Father; ideas such as these, and others alien to the minds of the people and subversive of much current practice, are invading China. Altho there may be a natural shrinking from the possible consequences of the absorption of these fundamental truths, which have become truisms in the West, it is obvious that certain results will follow as that if fire is applied to a pile of lumber it will burn, or if good seed is placed in the ground it will grow.

The new educational system, incomplete as it is, and imperfectly comprehended both by many teachers and more students, will affect the minds of intelligent Chinese to a marked degree. Hitherto the youth of China have fed on husks; now there is an attempt made to give them the kernel. They have fed on historical legends as much as upon true history, and both have been unconscionably dry. They have been taught to ascribe achievements that are puerile and childish to idols; as these things have never been questioned, the people have given them a credence more or less sincere. Knowledge of the aspirations, struggles and victories of other nations they have had none, except the inflated accounts of the prowess of their own ancestors in bringing into submission a few insignificant adjacent peoples, one degree more ignorant than themselves. Now all this is challenged. The new education, imperfect as it is, is bringing into perspective a thousand facts of life, and as many of science, which are overshadowing their own bloodstained history, and upsetting their own cosmogony, as well as the hitherto unchallenged reign of their gods and demons.

Further, the creation of a vigorous native press, which at times is even daring, which ten years ago was in its infancy, and twenty years ago undreamed of by any, except a few men who had lived in Hongkong or Shanghai, or who had traveled in Europe or America, brings into the shops and the homes of tens of thousands of the people a résumé of modern history, as well as a detailed account of what is transpiring thruout the eighteen Provinces of the Middle Kingdom. The native press of Hongkong and Shanghai is as effective as a vehicle of news or a medium of criticism as any paper in America; the press on the mainland of China is still winged by an extremely severe Government censorate.

There are, however, other factors that must be enumerated and considered. It is well known that the rulers of China are as alien to the people as are the British to the people of India, or the Americans to the Philippines. Just as of late

[illegible] there have been incontestable proofs that the Hindoos would gladly throw off the yoke of the British if they could, so for many years there have been societies in China, notably the Triad Society, whose aim it is to throw off the yoke of the Manchus and enthrone a scion of the royal house of the Mings, if one can be discovered, who shall be heir of their hate. There are confessed and pronounced revolutionists, like Sun Yat San, and others who are less vandalistic, like Hang Yau Wei, who are fostering this national spirit, and who are untiring in their efforts to concentrate, direct and give effect to this national aspiration.

The prestige of the Manchus has been irreparably ruined by their stupendous ineptitude and consequent humiliations at the hands of foreign governments. The more intelligent Chinese are now coming to see quite clearly that to the stupidity of their rulers, who assumed a virtue when they had it not, must be traced the humiliation of their flag and the loss of their territory. The rule of the Americans in the Philippines has already done much for the uplifting of the people, and will do yet more. In China the rule of the Manchus has involved the nation in disastrous consequences and exposed them to repeated defeats, with the usual unpalatable results.

The hatred of the Chinese toward their Manchu rulers has lately been perceptibly strengthened by the latter's repeated attempts to increase the burden of taxation. The new regime has involved the Government in increased expenditure, which in turn has compelled them not only to sweep the treasury, that no spare coin be lost, but also to increase the revenue. It is true that increased national expenditure is not confined to China, as any one may discover who will compare the modern budgets of Great Britain and Germany with their modest budgets of ten years ago. Somehow synchronously with this increase of taxation there is a marked increase in the cost of living. These two facts working together are producing their natural effect on the minds of the thoughtful Chinese, who see that they are almost the only nation in our age who are taxed without representation, and who, therefore, have no remedy unless they take up arms against the local official, who is the only embodiment of law and oppression that they are able to reach.

About three years ago a remarkable thing happened in China. The Government, without any previous indication to the public, suddenly promulgated an edict that henceforth Confucius was to be worshipped in all the new schools and colleges with the utmost devotion, and must be accorded honors equal to those hitherto given to the Mars of China. It must not be supposed, however, that in the past the sage of China had never been worshipped. On the other hand, he was worshipped some three hundred years after his death by the first Emperor of the Han dynasty. Moreover, Dr. Wells Williams, the famous American missionary and sinolog, affirms that there are more than fifteen thousand temples dedicated to the sage within the borders of the Middle Kingdom. It may be mentioned that Confucius has been distinguished from most other objects of worship, inasmuch as, with one or two remarkable exceptions, no idols have been carved to him. He has, for some reason not quite clear, been represented by a simple wooden tablet, on which are engraved honorific titles of resounding phrase and comprehensive meaning, or by a simple scroll of paper, with the same characters written thereon. These tablets are placed in the temples, and these scrolls are hung upon the walls of some colleges. The worship of Confucius, however, was mostly paid by officials and the literati, in which the common people have no more interest than have the costermongers of London in the opening of the British Parliament by the sovereign in person. Moreover, during most of the year, these temples are left to the spiders and sparrows, under the eaves of which beggars flee from the heat of the sun in summer, and under whose roof they find shelter from the north winds in winter. In fact, the cult of Confucius has naturally suffered from the natural decay of all spiritual ideas, which, during the last century and a half has numbed all aspiration, and from a freezing materialism, which has dominated the minds of the officials, the literati and the gentry.

This new edict came as a bolt from the blue upon the scholars of the empire.

The reason thereof, apparently, should be traced to the new desire, cherished by Chinese officials, that the new education should rescue China from her decadence, and elevate her politically to the level of Japan. Confucius, who hitherto had been the intellectual sage of China, would render more effective assistance to the students if he were elevated to the dignity of the God of War. The Chinese love etiquet, parade and flattery; if Confucius were treated in the same way he would be more amenable, and would be more willing to assist the minds of the Chinese students in their quest after knowledge, new and old.

Of late, however, the worship has become much more popular. As before remarked, hitherto Confucius has been the sage of the literati. It is true they had, in addition, their own patron saint, Man Cheung, whose image was carved standing upon a dolphin, confronting all students as they entered the once famous, but now demolished, examination halls in the provincial cities. But this year the worship of Confucius has been extensively engaged in by many of the common people. In many houses in Hongkong, on the birthday of the sage, two flags were hung out. One of these was the flag of China; the other was inscribed with Chinese characters which embodied the hope "that Confucius, the Holy, would live ten thousand years." What, then, induced the business Chinese, hitherto indifferent to the cult, to join in the worship? Probably they saw the chance of elevating themselves in the social scale. In the past traders have been regarded as standing at the base of the social ladder. By taking part in this worship they stand side by side with the haughty literati, whose proud boast it has been that none but they were entitled to offer their devotions and present their prayers to the Holy Man.

And now a strange thing happened. The press of South China attacked with fierce hostility both the Government for its edict and the people for recognizing it. It charged the Government with subterfuge, and asseverated that the Manchus, conscious of their waning power, and threatened downfall, canonized Confucius in order to appeal to his teachings in support of their claim to the right to rule China as they please, without any voice of the people or the interference of Parliament. Certain teachings of Confucius, applicable enough when they were uttered, seem to uphold autocratic government, and belittle the importance of the people. If, then, the Government could canonize Confucius, and induce the people to believe that he was essentially divine, then the rulers could appeal to his doctrines, as the final word on all matters, and among them the divine right of kings and emperors to do as they list, without respect to the opinions of others. In other words, the Manchus have attempted, in view of the approaching struggle, to hoodwink the people, and at the same time to buttress their own power by an unwarrantable and unpardonable appeal to the doctrines of Confucius, whom they previously deified, in order to invest him with the necessary authority.

The appeal to the people was just as emphatic, tho the argument was utterly different. It amounted to this: How are the Manchus, a barbarian and uncultured race, able to transform Confucius into a god? He was a clear-headed philosopher, but there were others like him. Lotsz and Mihtsz were his contemporaries. He was a great ethical teacher, who worked hard to amplify and unify the learning of his day, and make it more easy of access to the people. Some of his teachings are out of date; some do not cover the ground that must be covered today, if the Chinese are to hold their own among the nations of the world.

It is interesting to notice that the attitude assumed by the advanced section of the native press is precisely that maintained by all fair-minded and intelligent missionaries in China. They have come to see and frankly admit that he was a great ethical teacher, wonderful, indeed, for the age in which he lived, because he was not consciously endowed with any supernatural gift. On the other hand, he failed in some very important points. He apparently was quite indifferent to the claims of the people; he never seemed to recognize the sacred heritage of individuality; he would have scorned the doctrine of the equality of the sexes; in fact, there are many matters he left untouched.

But the point to be noticed is the fierce

outbreak of the press, because the editors profess to see in all this an attempt to guilt the people by investing Confucius with a quasi-religious divinity, which he himself distinctly disallowed, and for which there is not even a shadow of evidence, simply to support themselves in their autocratic power, in the hope, and with the definite purpose that thereby they will be able to thwart a revolution, or at least make it more difficult, because it will appear to be a contravention of the doctrines of the sage, who is divine, and whose dictum is therefore final.

We have touched upon some of the facts which confront us, which any candid observer must admit are ominous. They cannot for a moment be swept aside as unimportant, and without suggestiveness.

On the other hand, there is a good deal to be said in support of the contention that a successful revolution is impossible, and if one were attempted it would be abortive. One of the most obvious and often referred to characteristics of the Chinese is their apparent inability to trust one another. This lack of trustworthiness undermines all successful attempts at organization, for those whose instincts and personal training are as suspicious of their fellows as a bird is of a cat, will hesitate to place their fortunes and their lives in jeopardy. In a rush and with a shout, in the midst of any outbreak, where no organization has been necessary, the Chinese, like any other crowd, will follow one another and will act together. In mutual trust, which is essential to effective organization, they are markedly lacking, and we ourselves can recall at least one instance, where an attempt at a local revolution in Canton failed from this cause.

China covers a vast area, and its population is an immense conglomeration. Communication, therefore, between the different parts is difficult, and not always reliable. Moreover, the people of the South are foreigners and aliens to the residents of the North. There is, therefore, no possible means of organizing a movement that shall enmesh the whole of China, or which shall even embrace the larger and more important cities. There have been many instances of local uprisings of considerable magnitude, but the excitement, and even interest, have been confined to the disquieted areas, while the other parts of the empire have neither sought to discover the facts of the uprising, nor have they shown much interest in the issues.

The jealous watchfulness of the authorities in regard to the importation of weapons makes it difficult for arms and ammunition in large quantities to find their way into the hands of dissatisfied persons. It is true, arms and ammunition are smuggled into the country, and the bands of robbers which infest the south of China are always well armed, both with rifles and revolvers. But what are these among so many? The days are past, as in the Tai Ping rebellion, when civilians, armed with swords and scythes, could meet and cut down dispirited soldiers, who were armed with weapons as crude as their own.

These difficulties, however, might be met and overcome by resolute men. There yet remains the one obstacle that is colossal. The garrisons are still composed of Manchu soldiers, who get their rice directly from the Emperor, and whose duty it is to swagger over the Chinese and hold themselves in readiness to stamp out any kindling political fire. What the British regiments and batteries are in India the Manchu garrisons are in China.

In summing up the situation, it is obvious that much irritated unrest prevails, and that many aggressive forces, whose tendency is to disintegrate, are at work in the country; that burdens have been saddled upon the people during the last five years which are well nigh unbearable; that millions of the more intelligent and better educated of the people would clap their hands for joy if they saw the Manchus retreating; that the native press is bitterly anti-dynastic, even confessedly revolutionistic. On the other hand, the difficulties in the way of a successful revolution are apparently insurmountable, and we think that China will drag on longer yet, in the old, blundering and lumbering way, until she once more comes into political conflict with Japan about Manchuria, which may furnish the opportunity for which many wait.

HONGKONG, CHINA.

# Literature

## England's Governing Group

POLITICAL parties in England date back to the reign of James I. They were inevitable after the Reformation and the changes wrought by it in English life. Since the Revolution of 1688 Government has been thru political parties; and since about 1736 members of political parties have been seated to the right and left of the Speaker's Chair in the House of Commons much as they are today. Old as political parties are, never until *The Party System** was published, was there a critical examination of the working of the party system—certainly not by a man, who like Mr. Belloc, had been for some years of the House of Commons. Messrs. Belloc and Chesterton have written with much freedom and with no sparing of individuals or of institutions. Their book has aroused more comment in England—adverse and otherwise—than any book on contemporary English politics since the publication in 1885 of the "Radical Programme," a book on which Chamberlain, then the hope of all progressive liberalism, bestowed his sanction and his blessing.

The commotion to which the Belloc and Chesterton book has given rise is due to quite different causes than the commotion which followed the publication of Chamberlain's famous unauthorized program. That book was issued in July, 1885, six months before Gladstone surprised the country and bewildered his following in the House of Commons by his sudden conversion to Home Rule; and it was to the Whigs and moderate Liberals nervous as to what would be the course of the Liberal party after the then recent extension of the Parliamentary franchise, that Chamberlain's new program was disturbing. The Belloc and Chesterton book is an attack on both political parties—disturbing to some extent to the Conservatives, but much more disturbing to the Liberal

*"The Party System." By Hilaire Belloc and Cecil Chesterton. London: Stephen Swift. Pp. 256.

because the burden of it is that there is something in the nature of an agreement between the leaders of both parties that democratic progress shall be measured slow. The contention of the authors is that the struggles between the two parties in the House of Commons and on the platform in the constituencies are really sham battles, and that the leaders of both parties who are socially closely connected and have personal ends in common, work the party system very largely in the interest of what Belloc and Chesterton describe as the "governing group." Cobden and Bright in the era when the Whig governing families dominated all Liberal Cabinets and determined the policies of the Liberal party, long sought in speeches and letters to persuade England that this was the case. There is some confirmation for this theory and its application during the crises with the Lords over the rejection of the Franchise bill of 1884 in Elliot's recently published biography of Goschen. The veto conference of last year also confirms much of what Belloc and Chesterton assert. So do the recent revelations in the Education Department at Whitehall, and the difficulties which Loreburn, the Lord Chancellor, has created in connection with the appointment of magistrates; and it is because there is much truth, as well as some exaggeration, and perhaps a little distortion, that *The Party System* has aroused so much attention in England.

Concerning one part of the book—that which describes the financing of the two great political parties and the sale of baronetcies and peerages—there has been no controversy, and there could be none. All the conditions described have long been notorious, especially those under which men who have made great fortunes in the brewing business, in newspaper publication, in mining, in manufacturing, or in ocean transport, buy their way into the House of Lords

and into the ranks of the governing and socially powerful classes. Liberals quite as much as Conservatives are in these coveted ranks. Each party has always in its following men who by these methods are en route to the House of Lords. These roads are all well trodden. Men who have made money in manufacturing or commerce have been traveling them since the time of the younger Pitt—since the days when big fortunes first became possible in English trade and manufacturing. Newspapers not hampered by their relations with either party have sometimes called attention to these routes; but this is the first time that students of contemporary English politics have called attention in a book to this particular method by which democracy is systematically undermined and weakened by successive Liberal Governments.

## Three Stories of English Life

We have much to say these days about the great American or the great English, or the great some other novel. Every time a little mustard seed author gets a story accepted, he fixes his ambition upon some such performance as his ultimate goal. And it is about as sensible as the mother's expectation that her little puny boy baby will be President of the United States. Compared with the narrowest life the greatest novel is a small, limited, eclect affair. Only life is great, and the strongest, most comprehensive interpretation of it in a book is merely a little duodecimal tale, with a tadpole significance. John Masefield's new novel[1] is an illustration of this false ambition. There is too much in it for a story and not nearly enough in it for the scope of life it pretends to include. It is an effort to interpret various phases of existence at the present time in England. It contains a treatise upon science, politics, woman suffrage, society, love, religion—all considered both from the psychic and pathological point of view and illustrated by certain men and women, chosen by the author for this purpose. Any person, however illiterate in these matters, if he can take it in, will find when he finishes the volume that he has a conversational knowledge of all English life, art, science, literature, politics—every thing from lady-love to the poor cow. And enough epigrams to shine like an intellectual firefly, hind part before, in any conversation. But when it comes down to the author's nubbin moral, the tale teaches this one thing, that the cultivation and refinements of modern civilization have "made something that cannot be used"—namely the exquisite woman, who knows how to dress beautifully, pour tea gracefully, and inspire adoration by the texture of her skin, the clearness of her complexion and the general charm of her person, but who cannot bear to live long with the same man. Incidentally, you may infer from the failure of the hero's efforts to reform certain abuses in English life that it is not designed by God that any mere man shall reform the world. However, any sensible person who stops to think and observe would know this without reading so long a story. But from all this let no one infer that the *Street of Today* is a dull book. It is as bright as a printed constellation of the seven stars on a dark night. The only trouble about it is the "dark night." The author's mind leads somewhat into the futility of darkness rather than toward the dawn of better hopes.

The implication of the title of J. D. Beresford's novel[2] is that there will be a second volume. This is further borne out by the fact that the present volume ends abruptly. Just as the reader concluded that the unfortunate hero, betrayed and abandoned both by his wife and his affinity, is about to commit suicide by casting himself into the sea, the fellow sits down, thinks it over and decides he will begin all over again as a writer! His trials as a child who cannot use his legs, as a young man who fails both as an architect, as a lover, as a husband and as an affinity make up the incidents of this first volume. And if he cannot do any better in the second volume every reader will conclude that the author made a mistake in not permitting him to drown himself as he seemed inclined to do in this last paragraph of the

[1] The Street of Today. *By John Masefield.* New York: E. P. Dutton & Co. $1.20.

[2] The Early History of Jacob Stahl. *By J. D. Beresford.* Boston: Little, Brown & Co. $1.20.

last chapter. Still, there is hope for him in the second volume. We have all observed that persons who have failed ignominiously as writers make the most successful editors, and persons who make a poor tragic, neurasthentic business of living, often succeed wonderfully as authors of heroic and erotic fiction.

There are women in society who correspond to the anise seed bag which in England is sometimes dragged over the country by a horseman, leaving the scent like that of a fox. The diversion consists in riding to hounds following the artificial scent. It is great sport. Only you do not get the brush at the end of the trail. Milady Anise Seed provides the same diversion over and over for any man who is inclined to chase her—only he does not get the lady. Maybe he finds her sitting in a convent window, or in her husband's arms at the end of the trail. Not because she is repentant or good, you understand, but for the time being she is tired of that particular chase. She is a favorite character in fiction and the only distinction about Mrs. Belloc-Lowndes's new novel[3] is that the husband of Athena, the anise seed lady of the story, wrings her neck, figuratively speaking, during the chase, when she happens to stop long enough between performances to give him the opportunity—actually murders her with a kind of smiling cold-bloodedness which is not admirable, but effective. As for Jane Oglander, the real heroine of the story, she merely takes what is left of the exhausted and disappointed man who did the chasing. One cannot help observing that in each of these stories, the good woman gets every time only what is left of the hero after the bad one has eluded, degraded or discarded him. The question arises, of course, whether this denouement is true to actual experience in life. And if it is true, what ought to be done about it? There seems to be no way of getting rid of the lady anise seeds and no known method of keeping men from mistaking them for the genuine and desirable fox-trapping. Shall we recommend good women to cultivate more of the fox fragrance in character?

**Queed—A Novel.** By Henry Sydnor Harrison. With a Frontispiece by R. M. Crosby. Boston: Houghton Mifflin Co. $1.35.

Mr. Henry Sydnor Harrison springs at once, in his first novel, into the front rank of the new generation of realistic fictionists. With a training in journalism which lops off the exuberant foliage of the tree of life until it becomes no longer the tree of a sun-loving dream-life, waiting for blossoms, but one in full and abundant fruit, with the color and tang of October, he offers us a new hero and heroine of admirable stuff, and half a dozen other persons falling short of the heroic quality, but quite worthy the pains he has taken to differentiate the hard-and-fast sort from him of the loose joints and incessant cigaret. The ideals, the surroundings, the coloring, belong wholly to modern conditions. The scene is set in the Middle East, a little south of the line of harsh action in the Civil War period. The atmospheric background belongs to the second or third stage of reconstruction. It is the cue of the writer to mollify the harshness of the first period, to fix from a new point of view a more hopeful definition of loyalty to national ideals, and, in close connection with this, to indicate the turning of a new leaf in the story of the social and moral development of the reconstructed South. Evolutionary sociology, with altruism in the far distance, gives way to the evolutionary principle at work in the individual as he finds himself set down in modern life. The early Queed is typical of the theoretical individualism so rampant in the idle but earnest youth of the day. He needs, in the view of the author, to be turned down and spanked by some equally earnest and more practical type of evolutionist. Queed gets this preliminary impulse and develops rapidly—almost too rapidly, considering that his lines are not the lines of least resistance. He moves on to an ultimate heroism that will commend itself to any reader worth considering. Heredity in this human struggle gets a bad eye; but when did heredity ever get itself so stated that it did not deserve a bad eye? In the chemistry of life there is material for unexpected reactions. In the direction of some of these Mr. Harrison turns the back end of his quill, and lets it go at

that. There is in the story a new democracy which rather surprises one who thinks of the conditions of democracy in the old South. But the author wastes little time in explaining the method of exchange by which the old has become new. A less clever writer would have given many pages to the effort. Some hundreds of years have in Europe been given to the making of the exchange, and the machinery still hitches. It is a good exchange, and it is a hopeful thought for American life that only a few old ladies, like Mrs. Weymouth, unflinchingly oppose it. The book is on a high level in its ideals, in its broad philosophic treatment, in its hopefulness. The writer has perfect command of all the resources of his art. The story is condensed, rapid, full of mental and moral incident. It should engage the reader who runs, excite something more than a languid interest in the lady on the lounge, while it yields to the urgency of the many schools of philanthropic activities that have left the camp meeting methods of the last century and are finding a creed whose articles all relate to a field of earnest operations this side of the Dark River.

**The Coming Religion.** By Charles F. Dole, author of "The Ethics of Progress," etc. Boston: Small, Maynard & Co. $1.

So many varieties of the "religion of the future" have been proposed, and so much criticism has been aroused, that the unsophisticated might well conclude that it were better to practise the religion he already professed than fly to others that he knew not of. We learn with some feeling of reassurance, therefore, from Mr. Dole, who has always a worthy message for his readers, that "the coming religion" is not to be very different from that of the past. No vital element that has been evolved in man's struggle for righteousness and search for the infinite will be lost. Rooted in a great historical background, the coming religion will not despise its humble beginnings, but find even in the crudest superstitions evidences of progress toward the light. Mr. Dole believes the new religion will be more democratic, more rational and ethical. It will demand full allegiance to one's confidence, in it willing sacrifice will be the law of life, and even the "precious kernel" in the old dogma of the atonement will be preserved and appreciated. In a word, we are led to believe that "the coming religion" will be that of the prophets, of Jesus, and of Paul, the religion of righteousness and good will exprest in a purified and stronger Church. Mr. Dole even hints that we may look for the persistence of the leadership of Jesus as the "type of reality, devotion, good will, whom we all love and admire." The whole subject is nobly conceived and worthily set forth. Every intelligent and thoughtful reader will find in the book religious inspiration, and those in intellectual perplexity may here with assurance seek for help.

**Eve's Second Husband.** By Corra Harris. Philadelphia: Henry Altemus Company $1.50.

*Eve's Second Husband* is a study in the psychology of married life. The first Eve in history "managed her husband," and many of her daughters have followed in her primitive footsteps. Probably the Cave Woman had methods of cajoling her surly mate! The Eve of Mrs. Harris's story is, we are told, "placid, like the earth; one of those great, peaceful women who have no brains, and who balance the world in its orbit." Her placidity is proved by the fact that she does not in the least resent being told she has no brains by the brilliant Adam who happens to be proposing to her at the time. Most women would resent it, and it is not true of Eve. She has very good brains of her own, altho with a queer intriguing twist in them when it comes to managing her husband. That is, her second husband; the first managed himself so well, with such austerity, that he has become to his widow "Mr. Bailey's remains" at the end of the first chapter. Mr. Bailey is only a preface to the story of her life. The young politician, Adam West, whom Eve accepts in their first conversation, is the only husband that counts. He not only drinks, but gets drunk; he is not a faithful husband; he is not a great man, but merely a brilliant and fascinating one, extremely clever, in no particular more

than in his adroitness in getting around his wife's puritanical preferences for a sober and virtuous Adam. She loves him too dearly to forgive him.

"A wife never forgives her husband anything. It is neither moral nor decent to do so. Later I discovered that it is not wise to permit one's husband to place one on a pedestal. He does not suspect such a thing, of course, but this is one way he has of confining his wife. She is a lonesome little stool divinity fastened there by her virtues, while he goes his way with fewer and has a better time. . . . One of the things I have learned is that it is best for a woman to stay down in the dust of the road with her husband, no matter how pluperfect she is, and to hike along with him, no matter how imperfect he is. Women were not made for pedestal praise. And men were not made for us to be divorced from them, either by our superior characters or by the courts. It is our duty to keep wedded to them."

Such is Mrs. Harris's theory of married life, set out in the adorned prose we have learned to expect from the author of the "Circuit Rider's Wife." A hundred happy phrases come to mind, like: "The versatile sincerity" of the politician; the "maternal trance" of the good woman; the "doggerel femininity" of the evil woman; there is nothing Mrs. Harris touches that is not illuminated by her gift for epithet.

**French Men, Women and Books.** By M. Betham-Edwards. Chicago: A. C. McClurg Co. $2.50.

Miss Betham-Edwards gives to her latest volume this sub-title: "A Series of Nineteenth-Century Studies." Some of the papers gathered together here are really no more than fairly well-written reviews of recent books; here belong the chapters on the rather dreary love story of Balzac and Madame Hanska; the account of Barbey d'Aurevilly and his publisher Trebutien; "An Anglo-French Romance: Mary Clarke and Claude Fauriel"; the essays on MM. Reynaud, Boyslève, Bordeaux, Marguerite, Desmoulins, Joseph Reinach and others. The chapter on "A Typical Artisan and the People's Universities" affords information of a movement about which little is known outside of France, however; and the opening chapter, "French Domestic Poetry," is valuable enough to make us welcome the whole volume regardless of all the interesting pages which complete it. French classic verse is known to English and American readers either directly or thru criticism; French romanticism is also well known; but the existence of a body of modern verse distinguished by a "uniformly wholesome and bracing attitude toward existence, its joys, sorrows and limitations," has scarcely been suspected. In this department of French poetry, "toil is nobly apostrophized," and the very existence of such poetry "is also a corrective of insular prejudices, revealing the homely, home-loving aspect of French life, and the integrity of the family circle." Miss Betham-Edwards not only discusses this literature, but also offers some highly respectable translations of some of the verse under discussion. And in writing of "The New Fiction" she records an anecdote that is singularly apposite:

"'"Home Life in France"?' asked an unraveled English woman, taking up a work thus entitled [a work by Miss Betham-Edwards herself, we may add]; 'have the French really any home life?'"

That the French have indeed that life—that it is a deep and potent and on the whole very charming life—is one of the facts that the author of *French Men, Women and Books* would make known to us. And her volume would be worth while, if it suggested no more novel point of view. One may call in question some of her enthusiasms—notably her praise of Balzac's "Lettres à l'Étrangère" and her characterization of the same novelist as "a charming table-talker and story-teller"—but one takes pleasure in her writings all the same, in spite of their failings, their occasional barbarism and slips of the pen; as where Balzac's lady is referred to as "Monsieur" de Hanska.

**Cuba.** By Irene A. Wright. 312 pages. Illustrated. New York: The Macmillan Co. $2.50.

Ten years' continuous residence in the island entitles the author of *Cuba* to a respectful hearing, altho she insists on having her statements considered as her personal opinion only. For four years at a time she traveled hither and yon thru the various provinces on work entailed by connection with local papers and later by an appointment as special

agent of the Cuban Department of Agriculture. Finally she edited a monthly publication devoted to the agricultural and industrial aspects of Cuban life. We are thus spared the "careless impressions of travel" type of remarks. But the "impressions," however careful, are too many; insignificant villages of the interior are described with a faithfulness of detail which to the thousands who have never visited and will never visit Cuba appear very superfluous. Several chapters, however, emerge above that ocean of landscapes, seascapes and other pen pictures. "Home Life," "Foreigners in Cuba," "Cuba Libre," "Wanted: A Market," contain very remarkable pages. The author shows herself very sceptical as to the future of the island unless very great changes occur. The land problem must be solved in Cuba before any progress can be made.

"On undeveloped tracts there has never been any taxation: to this day owners can well afford to let square miles of countryside lie idle, refusing to cultivate it themselves or to allow others to do so. But the moment they, or tenants, begin to develop land, it acquires a rental value, and on this there is taxation (4 per cent. in the case of rural and 8 per cent. in the case of urban property, per annum, 30 per cent. of which the municipality which levies it turns over to the province within which the real estate is situated). In effect the Government penalizes the owner, and, thru him, the renter, for the serious misdemeanor of industry."

The next problem to be solved is the fiscal problem. The burden of taxation bears more heavily on the individual in Cuba than anywhere else in the world.

"Eighty-five per cent. of the administration's total income is obtained there by way of duties on goods imported. According to the latest official report of the Cuban treasurer the total of collections during those twelve months was $24,794,966.07. This means that (dividing that amount by 2,048,980, Cuba's population at the time, according to the census of 1907-1908) every man, woman and child in the country contributed $12.10 towards this Government's support in that period under the one single heading of customs receipts. This is the world's record, for, comparing it with those of 'high protection' countries elsewhere, it shows up as follows: Austria, $.51; Germany, $1.22; Italy, $1.72; France, $2.22; United States, $3.55, and Cuba, $12.10."

The creation overnight of a Cuban republic the author thinks was a great mistake, pregnant with unpleasant consequences for the United States.

"At Roosevelt's command (not by the will of a non-existent Cuban people) the Cuban republic arose in a night, on soil owned by others than its electors, swarming with a bureaucracy these foreigners and producing Cubans have had to support ever since. There it stands tottering; when finally it collapses to its inevitable destruction let Americans on hearing the crash recall distinctly that this republic is not a creature of Cubans—it was neither fashioned by them nor by them upheld—but, on the contrary, it is of all-American manufacture. Americans built it. Americans set it up again when once it fell flat. American influence is all that sustains it to this moment. If they discover anything to criticise in it, or its failure, let Americans remember in so criticising that they are dealing with the work of their own hands."

**George Thorne.** By Norval Richardson. Boston: L. C. Page & Co. $1.25.

This story of an impersonation has a dramatic quality, and the pathos of a mother's love and long waiting for the return of her child, kidnapped twenty years before the opening of the story, lifts the novel above melodrama. The young man who impersonates the lost son wins the reader's sympathy against his conscience; we cannot approve of his masquerade, yet we like the man he grows into and the process of his transformation is an interesting study. What had been in its incipience a cold-blooded plan of persistent deceit becomes warm with emotion, entangled with many lives and sympathies. As his soul grows George Thorne finds his role more and more difficult; sin is never straightforward, and not so easy as it looks; even its pleasant rewards grow distasteful and the end of the imposition is surprising and unexpected, unjust perhaps, yet not unethical.

**John Ruskin.** A Study in Personality. By Arthur Christopher Benson. New York: G. P. Putnam's Sons. $1.50.

The second title in this case is a perfect description of the book. It is "a study in personality," for in it the details of Ruskin's life, the characterization of his literary style, the criticism of his views on art and political economy, and the explanation of his successes and failures are all subordinated to a presentation and an interpretation of the man himself. This point of view is in itself Ruskinian, and Mr. Benson is by temperament and training especially fit-

ted to appreciate Ruskin and to trace his influence on English thought. Mr. Benson's essays in the volumes, "From a College Window," "Beside Still Waters" and "The Silent Isle," are all delightful to read aloud, but this study is especially adapted for this purpose, since it is composed of Cambridge lectures.

## Literary Notes

....The third volume of *The Legends of the Jews* (Philadelphia: Jewish Pub. Soc.) translated from the German manuscript of Louis Ginzberg has just been published. The legends and symbolic narratives included relate to the life and work of Moses.

....Subscriptions for the establishment of the "Orchard House" in Concord, Massachusetts, as a permanent memorial to Louisa M. Alcott, should be sent to Henry F. Smith, Jr., Middlesex Institution for Savings, Concord, Massachusetts, instead of thru Little, Brown & Co., as previously stated in THE INDEPEN-

....Those wishing to make the acquaintance of the most extreme European fiction and drama may avail themselves of the "Modern Authors Series" published by Brown Bros., Philadelphia, at 50 cents a volume. The latest issues are three of Frank Wedekind's short stories, *The Grisley Suitor, Rabbi Ezra* and *The Victim*, and Garshin's *Red Flower;* tales of lust and cruelty, characteristic of the Decadent and Post-Decadent schools.

....The second volume of the *Protokoll der Verhandlungen* of the fifth World-Congress of Religious Liberals, held in Berlin last summer, has now been published. The first part of the volume contains the addresses of the *Ausländer* translated into German. Several well known American names appear, such as those of Prof. Bacon, Dr. Slicer, Emil Hirsch and the general secretary, Rev. Charles W. Wendte, of Boston.

Charles Macomb Flandrau's *Prejudices* is a volume of essays in a pleasant key—essays on social topics, about people and books. The essayist is not a reformer; we even suspect him of being that dreadful creature (nowadays), a conservative; but he is an unimpeachably good companion. *Prejudices* is to be placed in the same row of books with some of E. S. Martin's essays; tho it does not measure quite up to these. (Appleton, $1.)

Prof. W. C. Wilkinson has gathered into a volume several of his careful and elaborate essays, of which two on *Daniel Webster and Nullification* give title to the volume. Professor Wilkinson has been for many years the stoutest defender of Webster's political career and private life. He regards his seventh of March speech in defence of the Fugitive Slave Law as a magnificent political triumph which for ten years postponed the Civil War and made its happy conclusion possible (Funk & Wagnalls Co.; $1.25).

....From the Carnegie Institution comes a valuable and extensive *Inventory of Unpublished Material for American Religious History in Protestant Church Archives and Other Repositories,* prepared and edited by Prof. William Henry Allison, of Colgate Theological Seminary. This volume shows the abundant manuscript sources in our country still unused in dealing with the subject concerned, and suggests the value of preserving documentary materials and depositing them in places of safe keeping for future use.

....The Russell Sage Foundation issues *Seven Great Foundations,* by Leonard P. Ayres, a brochure which describes the Peabody Education Fund, the John F. Slater Fund for the Education of Freedmen, the Carnegie Institution of Washington, the General Education Board, the Carnegie Foundation for the Advancement of Teaching, the Russell Sage Foundation, and the Anna T. Jeanes Foundation. It gives convenient information as to the history and purposes of these foundations which are all devoted to education and public improvement.

....Among the protagonists of Reform Judaism in Germany and America none is held in higher esteem than the late David Einhorn, the centennial of whose birth was recently celebrated. Several of his most significant and representative sermons and essays, written in terse, lucid German, together with a biographical sketch by K. Kohler, and a memorial oration by Emil Hirsch, are now published by Bloch, in a limited edition, as a *Digne Libbera Memorial Volume.* The sermons are models of vigorous thought, fine diction and convincing fervor.

....Although Schleiermacher holds a conspicuous place among great leaders in the development of German theological thought, his chief work on "The Christian Faith" seems never to have been translated as a whole into English. This neglect is now partially overcome by Prof. George Cross, of Newton Theological Seminary, who gives a carefully prepared "condensed presentation" of this noted work in his study of *The Theology of Schleiermacher* (University of Chicago Press; $1.65 postpaid). The book opens with a good survey of the life of Schleiermacher and his relation to previous theologians, and closes with a critical estimate of his work and its influence.

Hilaire Belloc is one of the well traveled and real journalists whose ponderings one may now safely ignore as they appear in the London press, being quite sure that those of them in any sense worth while will be whipped into even better shape and published in due time in a presentable volume. His book *On Something* follows the twin volumes "On Anything" and "On Everything," and is of the same general content; which is to say, a content so various as to defy brief definition. The opening paper is a plea for the simpler drama and an example of Mr. Belloc's own idea of dramatic writing is presented in the five-page piece entitled "The Crisis"—a piece in which absolutely nothing happens. We are not sure, but we think Mr. Belloc is satirizing both the conversational dramatists *à la Shaw*, and the producers of spectacular drama. (New York: Dutton.)

....Three new volumes in *The Musicians' Library* extend this valuable series in ways that will be welcome to music lovers. In *Songs from the Operas for Tenor*, Mr. H. E. Krehbiel has arranged some thirty operatic airs in chronological order and with the special purpose of making them convey as nearly as possible the same impressions to the student and singer today as they did to those who first heard and sang them. The selections range from Purcell's "Indian Queen" to Mascagni's "Cavalleria Rusticana," and represent all schools significant from an historical or artistic point of view. The introductory notes are all that could be desired. The other volumes consist of the exquisite *Piano Lyrics and Shorter Compositions* of Edvard Grieg, and some well *Selected Piano Compositions* from the works of J. Brahms, the first edited by Bertha Feiring Tapper, the second by Rafael Joseffy. The introduction to the Grieg volume, written by Mr. Samuel Swift, is discriminating as well as descriptive, but will appear to some not appreciative enough of their favorite. Users of the work, however, would do well now and then to forget their enthusiasm for the charming music while they peruse these notes on its setting and content. Perhaps the opposite course needs to be commended to users of the Brahms volume, if they are not already "initiated." Read carefully *first* Mr. James Huneker's glowing introduction, and it may supply courage and patience while you are following his counsel to 'strip him (Brahms) of his harsh rind [whatever that may be in piano music], and taste the richness of the musical fruit." If any arrangement could dissipate the "dislike at first sight" of which Mr. Huneker speaks, it would certainly be that so skilfully done in this volume by Mr. Joseffy. (Ditson; $2.50 each, postpaid.)

## Pebbles

City Miss—My good man, have you lived here all your life?

Old Farmer—No, not yet.—*Judge*

There was a young man of Quebec
With prickly heat up to his neck;
When asked was he hot,
He replied "No, I'm not,
We don't call this warm in Quebec."

W. R. Holt, the "galloping reporter" from London, described neatly, at the New York Press Club, the essentials of good reporting. "A good reporter," he said, "should be able to handle a man as an astronomer handles a telescope—that is, he should be able to draw him out, see thru him, and shut him up."—*Los Angeles Times.*

The difficulties of translation are enormous. This well-worn fact has been recently discovered again by some South African missionaries who have had favorite English hymns translated into the vernacular for the benefit of their native converts. Months after they found out that their translator had been particularly free. His version of the well-known hymn which opens with the line, "Lord dismiss us with Thy blessing," was, "Lord, kick us out, softly, softly."—*London Times.*

CHEMICO-METRICAL MADRIGAL.

I know a maiden, charming and true,
With beautiful eyes like the cobalt blue
Of the borax bead, and I guess she'll do,
  If she hasn't another reaction.
Her form is no bundle of toilet shams,
Her beauty no boon of arsenical balms,
And she weighs just sixty-two kilograms
  To a duo-decimal fraction.

Her hair is a crown, I can truthfully state,
'Tis a metre long, nor curly, nor straight,
And it is as yellow as plumbic chromate
  In a slightly acid solution.
And when she speaks, from parlor or stump,
The words which gracefully gambol and jump
Sound sweet like the water in Sprengel's
    pump
  In magnesic phosfate ablution.

One day I said, "I will leave you for years,"
To try her love by rousing her fears;
She shed a deciliter of tears,
  Turning brown the turmeric yellow.
To dry her tears, I gave her, you know,
A hectogram of candy; also,
To bathe her red eyes, $H_2O$;
  She said, "You're a naughty fellow."

I have bought me a lot, about a hectare,
And have built me a house ten meters square,
And soon, I think, I shall take her there,
  My tart little acid radicle.
Perhaps little sailors on life's deep sea
Will be the salts of this chemistry,
And the lisp of the infantil A, B, C,
  Be the refrain of this madrigal.

—*H. W. Wiley, U. S. Dept. of Agriculture*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Exports and the Tariff

In the fiscal year which ended with last month, our exports for the first time exceeded $2,000,000,000. Nearly one-third of this sum was the value of cotton sold to manufacturers abroad. Grain, meat, dairy products, flour and cattle accounted for a large part of the total. These are dutiable when imported into this country, but the tariff duties, as a rule, do not affect the prices for which they are sold here. The duties were imposed to satisfy the farmers. Such gain as has come to our agriculturists by reason of tariff protection has come indirectly and not on account of the duties on foreign products like their own.

Another considerable part of the $2,000,000,000 was the value of manufactured goods, highly protected, which were sold abroad in successful competition with similar foreign goods. That is to say, American manufacturers, asserting that they needed the existing protective duties to defend their industries against the invasion of foreign goods, have sold their own products abroad in open competition with those foreign goods, without the aid of protective duties and frequently under the disadvantage imposed by heavy charges for ocean transportation. They have done this by making their prices to foreign buyers much lower than those which they required their own fellow-countrymen, here in the United States, to pay.

A prominent resident of Australia, writing a few weeks ago, gave the following illustration of this practice. He desired to buy some agricultural machinery, and he asked an importer in Australia for prices. Exhibiting a printed price-list which is circulated in the United States, the importer undertook to deliver in Australia any article in the list for one-third less than the price printed for delivery in this country. "That is," said this Australian buyer, "after paying our tariff and the freight charges for 10,000 miles, we pay less than the American farmer." He added that Australia was buying American railway rails and locomotives at prices lower than those of the similar English products, altho England had the advantage of a preferential tariff.

Our Government has published a statement in detail of the exports for eleven months of the year. It is estimated that exports of iron and steel manufactures, for the entire year, were about $235,000,000. Here are some of the figures for eleven months:

Steel rails, $10,500,000; builders' hardware and tools, $15,600,000; structural iron or steel, $7,800,000; locomotives and other engines, $10,700,000; mowers, reapers, plows and cultivators, $23,000,000; sewing machines, cash registers, electrical, mining, and metal-working machinery, $33,300,000; wire, $9,100,000; iron or steel pipe, $9,800,000; railroad cars, $7,600,000; steel sheets and plates, $13,700,000; steel bars and rods, $4,600,000; cotton cloth, $21,800,000; boots and shoes, $12,600,000; timber, $10,600,000; boards, $30,000,000; upper leather, $22,500,000; sole leather, $7,300,000; tin plate, $2,161,472

These exports were widely distributed. Referring to iron and steel products, the Bureau of Statistics said, on June 19:

"This largest item in the list of manufactures entering into our export trade is represented by exports to literally every part of the world. The United Kingdom, Germany, France, Netherlands and other parts of Europe; Argentina, Brazil and practically all the South American countries; South Africa, the British East Indies, China, Japan, Australia and the Islands of Oceania, and our nearer

neighbors, the British West Indies, Central America, Mexico and Canada appear in the list of the countries to which the various articles of iron and steel are sent.

Large sales to foreign buyers have recently been made. The *Iron Trade Review* of two weeks ago said:

"Export business continues to be very active, and the first half bookings of the United States Steel Products Company will approximate 1,000,000 tons, which is an increase at the rate of about one-third over last year. Heavy orders for galvanized sheets are being taken for shipment to Argentina and Chili. The Mexican Northeastern Railroad has ordered several thousand tons of steel wheels and axles, and another Mexican line 3,000 tons of rails from the leading exporting interest."

Protective duties with respect to all the exports reported above by the Government are imposed by law. The duty on steel rails is $3.72 per ton; the rate for sewing machines is 30 per cent.; engines are protected by 30 per cent., tin plate by a specific duty which is exactly 33⅓ per cent. of the average value of last year's exports. The rate for machinery not specifically mentioned is 45 per cent. The manufacture of tin plate was created and built up here by a protective duty, and the domestic output rose from 2,500,000 pounds in 1891, when 1,000,000,000 pounds were imported, to 1,391,000,000 pounds in 1909.

Growth of our exports of manufactured goods is something to be desired, and the American people should regard it with satisfaction and pride, if it has been due to conditions and methods involving no injustice to themselves or others. We should rejoice because the exports of iron and steel manufactures have increased from only $29,000,000 twenty years ago, and $117,000,000 ten years ago, to $235,000,000 in the fiscal year just closed, if there has been fair treatment of those who granted the protection by the aid of which our iron and steel industry was expanded.

It is well known, however, that the sales of a very large part of the exports enumerated by the Bureau of Statistics were made at prices much lower than those which our own people have been required by the manufacturers to pay. Many instances might be cited. A familiar one is furnished by the steel rail trade. For many years the price in the United States, at the mill, as fixt by a combination agreement, has been $28 per ton. But the manufacturers, while exacting this price from their fellow-citizens (thru the agency of the railroad companies), have sold large quantities in foreign countries at much lower figures. The export sales of last year, $10,500,000, were not made on the basis of $28 per ton at the American mill. Some years ago, when John W. Gates was president of the manufacturing company at Chicago which afterward became a part of the United States Steel Corporation, he was asked to explain why he had sold large quantities of rails to foreign buyers at about $18 per ton, the uniform price in this country being $28.

He replied, over his signature, that domestic orders were few and he had made these foreign sales to keep his mills going. His questioners then asked: "Could you not have kept them going by selling rails to American buyers at $18? Would not our own railroads have been glad to buy as many as you sold abroad, and many more, at that price?" To these inquiries he gave no answer. A full explanation would have involved an admission of the existence of an unlawful combination to maintain a high and uniform price in the United States. While testifying recently before a committee of Congress, Judge Gary, the head of the Steel Corporation, attempted to defend in a similar manner the sale of steel products to foreign buyers at prices below those which our own people must pay.

These large export sales of protected products, overcoming the competition of foreign manufacturers in neutral markets, and even overriding local tariffs in some markets which are not neutral, are an admission—if the selling prices are those current in the United States—that the protection given here by tariff duties is not needed. The truth is, however, as we have said, that as a rule (to which there are exceptions) the prices are much lower than those which are exacted here, in many instances because of combination agreements.

This practice of discriminating against the American buyer and consumer in the sale of protected products to foreign purchasers exhibits the manufacturers' in-

gratitude and their disregard for the rules of fair play. Having sought and obtained from their own people protective duties, they exact—by combination or otherwise—high prices from those who gave the protection, at the same time selling the protected goods to foreigners in Europe or elsewhere at prices 10 to 30 per cent. lower. There can be no decent excuse for this discrimination, and there are no more dangerous foes of the protective policy in this country today than the exporting manufacturers who are guilty of it.

## Hot Weather Study

ALL of the leading summer schools this week report unprecedented attendance and temperature. Even a thermometer standing at 100° and a hygrometer registering 85 per cent. of humidity cannot wilt or dampen the enthusiasm of the summer seekers for intellectual gratification. Their eagerness to improve all their opportunities, their thirst for information of every kind, is an astonishment to the college professor who for the first time extends his work beyond commencement. He sees before him a class that, instead of being passively receptive or resistant, is avid and compelling. He feels like a man who has pushed a cart up a hill and suddenly finds it running away from him down the other side. He is disconcerted to find that the summer students, with their astonishing literalness, really believe what they have often been told, that "education" is derived from *e-duco*, for they proceed at once to draw out knowledge from him at a rate that makes him grateful for the shortness of the term.

For the summer student has been saving up money and time for years to get this chance at the fountain head of Pierus, and he is determined to get the full equivalent of both these savings. The New England conscience, nowadays becoming extinct, even in its native habitat, exists in full vigor among teachers—especially of the female sex. They have no time for frivolity, and "academic leisure" seems to them a contradiction in terms. All their pleasures must be teleological. They will not consent to a Saturday afternoon excursion by trolley or steamboat unless it leads to some site of historic or literary interest. They will not go for a walk in the woods without taking along a vasculum or a bottle of cyanide or a geologist's hammer as a justification. To induce them to spend an evening on the campus instead of in the library it is necessary to give them a musical program, with emphasis on the program, or an *al fresco* performance of "As You Like It." The natural result is, of course, that they have a very much better time than those poor creatures who, having plenty of leisure and money, spend the summer in a vain effort to amuse themselves. For if you aim at the Blue Bird you can never hit it.

The summer school is the lineal descendant, thru the chautauqua assembly, of the camp meeting, and it still retains traces of its parentage. There is something of the old emotional excitement about it; something of the tenseness of a crisis. Now is the accepted time for new birth, for the renaissance. It is a revival of learning for those who have backslid and have allowed the cares of this world to choke their pristine enthusiasm for the intellectual life. The contagion of example, the association with kindred minds, the incentive of contact with leaders of thought, the stimulus of new environment, the sense of exceptional opportunity, make the summer school atmosphere electric and favorable to the reception of deep impressions and the formation of high resolves. And withal it keeps much of the holiday spirit of informality and unconventionality that should belong to vacation time. The summer students have their "extra-curricular activities," as the university catalogs phrase it, but they are less fixed and compulsory, more spontaneous and varied, than those of the hibernal students. It is to be hoped that the summer school can keep its elasticity of method and spirit. It has already done wonders for the universities by its innocent iconoclasm; shaking up departments, breaking down barriers, promoting migration, cutting new paths and disregarding traditions. But unfortunately, this sort of renovating is what educational institutions are always in need of.

The summer school idea is spreading to other countries and carrying with it

something of the same sort. We have in hand the announcements of the *Ferienkurse* in Jena, which bring to the quaint old university town every summer teachers of men and women, mostly teachers. There are over fifty instructors of both sexes, many of them with names recognizable at this distance. Some of the courses sound portentous, especially in the original. Would the most ambitious of American schoolma'ams venture to enroll for *Geschichtlicher Ruckblick auf die neuere biologisch-physiologische medicinische Kinderforschung?* And what American university would venture to give a course of lectures on the question *Ist Jesus eine Gestalt des Mythus?*

We mention these merely for the benefit of those confirmed summer students who have been the rounds of all the American universities and now sigh for other worlds to conquer. We are convinced, moreover, that if the Canadian Government would open up a university on the shores of Hudson's Bay next summer, Columbia, Chicago and Harvard would stand no chance of competing with it.

## The Cow and Human Tuberculosis

WITH the increase of interest in tuberculosis and above all with the recognition of the fact that it was not essentially an hereditary disease but on the contrary infectious, and then with the discovery that cows suffered very frequently from an affection so similar as to be practically indistinguishable, the question of the relation of bovine to human tuberculosis came to be one of the most important problems of sanitary science. In the early days after the discovery of the tubercle bacillus it came to be generally admitted that the two diseases were the same and that therefore great care was needed to protect man from infection thru bovine tuberculosis. Most of our sanitary laws embodied this principle and milk and meat inspection were founded on it. The government in many countries took up the question of sacrificing cattle known to be affected with it not only in order to prevent the spread of the disease among cattle, but above all among human beings. The scientific principles behind this legislative development were supposed to be quite indispatable.

Into the midst of this situation Professor Koch, acknowledged as the greatest expert in tuberculosis in the world of the time, threw a bomb in the shape of a practical denial of the possibility of the transmission of tuberculosis from cattle to man to any extent. He did this in a paper read before the British Congress held in 1901. He had been investigating the subject for many years, a large number of observations had been made by his assistants, he spoke almost officially for his German colleagues, and no wonder the world was startled. Cattle and milk inspection were extremely expensive, regulations were often very annoying and here was a declaration that no good was being accomplished or so little that it was scarcely worth while talking about. Professor Koch concluded his observation on the subject of the possible relation of bovine to human tuberculosis with these words: "What has hitherto resulted from this investigation does not speak for the assumption, that bovine tuberculosis occurs in man." He admitted that the question was not absolutely decided but he said that it was well known that "the milk and butter consumed in large cities often contained large quantities of living bacilli of bovine tuberculosis. If such bacilli were capable of infecting human beings there would be many cases of tuberculosis caused by them particularly among children." Most physicians, he said, think that a great many cases occur. If they did occur, however, they would begin with intestinal tuberculosis and such cases are extremely rare.

Everywhere this declaration created a sensation. The admission that his conclusions were not absolute seemed to justify the continuance of precautions such as had been enforced by law before this time. Besides, there had come to be a little feeling of uneasy suspicion with regard to Professor Koch's announcements as regards tuberculosis at this time. In 1891 he had startled the world with his tuberculin as a cure for tuberculosis. It proved not only not to

be a curative agent, but in the quantities in which it was used to be a very dangerous agent, which probably hastened the deaths of many consumptives. Some six years later had come his announcements with regard to a modification of this tuberculin, which was supposed to eliminate the dangers and leave all the curative effects that had first been promised. This new tuberculin very soon proved in the hands of observers all over the world to be almost inert. Certainly there was nothing in it that would justify the hopes that had been raised by Professor Koch's announcement. In spite of this, however, his declaration at the London Congress in 1901 caused great uneasiness. It gave an opportunity for many people who like to have the chance to discredit science to say a number of derogatory things.

One thing was clear. The whole subject would have to be gone over again and thoroly and completely, so that only an investigation undertaken by Government and carried out to an absolute conclusion, no matter the time or expense or labor required, was necessary. The British Government took up the duty and a commission was appointed to decide the three important questions: First, whether human and bovine tuberculosis are the same; second, whether animals and man can be reciprocally infected with it; and third, under what conditions, if at all, the transmission of the disease from animals to man takes place and what are the circumstances favorable or unfavorable to such transmissions. The answers to these questions were reached at intervals. The first report, in 1904, showed that the bacilli of certain cases of human tuberculosis produced a form of tuberculosis in cattle indistinguishable from bovine tuberculosis. A second and third report in 1909 showed that bovine tuberculosis was under certain circumstances infective for human beings thru milk and discussed the conditions of infectivity. Now comes the final report, which shows that at least one-half of the cases of intestinal tuberculosis in human beings are probably of bovine origin, and some at least of the cases of pulmonary tuberculosis. In men, in the studies of the commission, two out of twenty-eight cases were of bovine origin.

The report of the commission concludes then:

"In view of the evidence adduced by us we regard ourselves as called upon to pronounce administrative measures required for obtaining security against the transmission of bovine tubercle bacilli by means of food. In the interest therefore of infants and children, the members of the population whom we have proved to be specially endangered, and for the reasonable safeguarding of the public health generally, we would urge that existing regulations and the supervision of milk production and meat preparation be not relaxed, that on the contrary the government should cause to be enforced thruout the kingdom food regulations planned to afford better security against the infection of human beings thru the medium of articles of diet derived from tuberculous animals.

"More particularly we would urge action in this sense in order to avert or minimize the present danger arising from the consumption of infected milk."

The commission further adds, that while tubercle bacilli are known to be abundantly present in cases where the cow is suffering from tuberculosis of the udder and it has sometimes been supposed that these are the only cases in which milk is dangerous, their observations show that tubercle bacilli may be present in the milk of tuberculous cows presenting no evidence whatever of disease of the udder. The commission is a unit in declaring care with regard to tuberculous milk will particularly prevent the cases of intestinal tuberculosis and also of cervical gland tuberculosis. It is well to know that these two forms are the source of a great deal not only of annoyance but even of fatal complications and developments. Bone tuberculosis is also probably related to bovine tuberculosis and to the ingestion of this form of tubercle bacilli with food and drink.

An important question has therefore been settled. Fortunately Professor Koch's revolutionary declaration was not permitted to influence the legal regulations already in vogue, so that very little now needs to be done in the matter to carry out the suggestions of this English commission. Their conclusions, however, will make everyone who is inter-

ested in the health of children particularly ready to exercise more care with regard to the important question of possible infection by cattle products.

*

## Tripped by Red Tape

That the Department of Agriculture should be in danger of losing three of its leading experts on food adulteration, Wiley, Bigelow and Rusby, on account of a technical violation of the salary regulations, shows how a government is hampered by its bureaucratic methods. It is not claimed that Professor Rusby, of Columbia University, was avaricious in refusing to work for $0 a day or that the departmental authorities who arranged for him to be paid at the rate of $20 for part of the year were wasting public funds. Any one of these three men, if he had been willing to put his knowledge of chemistry at the service of an adulterator of food or an evader of customs, could have made a great deal more money and had a much easier time of it.

It is not merely a pecuniary sacrifice which must be made by men of exceptional ability and proficiency when they enter any branch of government employ. A greater deterrent is the fact that they find that they are not free to work in their own way but have to submit to the detailed dictation of a lot of clerks and lawyers. This is particularly the case with the scientific departments. The scientific temperament is in eternal conflict with the legal temperament. The one cares only for results; the other insists upon methods. The former is striving for something new; the latter sticks to precedents. Consequently the scientific men in Government employ are apt to be in a chronic state of irritation unless they are of the conventional routine type of mind, that is to say the unscientific type of mind. In the case of a high spirited and original genius this irritation sometimes rises finally to the pitch of exasperation and he goes off on a tangent, sending in a farewell letter to "the Department" telling them just what he thinks of them for refusing to pay for that tin cup which he bought without the proper requisition or for sending back his last report because only one color of ink was used on it. Men of calmer temper will get along somehow rather than give up work they are interested in, paying for the things that are necessary but not allowed, out of their own pockets, or collecting money on the side from some patron of science, and resorting to various evasions and misclassifications to get within the letter of the law. Probably the strict and literal enforcement of all the regulations in any department would stop its work. We have experimental evidence in support of this supposition, for in France and Italy it has been tried in the government railroad and postal service, where the employees instead of striking decided to obey the rules, all of the rules, all of the time. The result proved that obedience was better than sacrifice of wages because it was more effective in tying up the traffic.

The United States Government has been remarkably liberal in its appropriations for scientific purposes, both theoretical and practical, but the results have not always been commensurate with the expenditure, partly because of the conditions under which the work had to be performed. By a process of natural selection the men of greatest initiative and originality tend to be eliminated out of the system. This is why the phrase "Washington science" is so commonly used in a derogatory sense.

Now the Bureau of Chemistry, under Harvey W. Wiley, for the past twenty-eight years has succeeded in keeping out of the ruts. It has set a fast pace for the State agricultural experiment stations. It has made many original contributions to science. It has initiated many valuable reforms in legislation and in agricultural practice. Dr. Wiley has a good temper. He laughs and grows fat on worries and opposition that would drive some men mad. He has been able to live in a bureaucratic atmosphere without losing his scientific spirit, or, what is more remarkable, his zeal for reform.

It is true that his zeal for reform has at times overruled his scientific spirit. As THE INDEPENDENT pointed out in an editorial published September 3, 1908, his experiments on the effect of sodium benzoate and other preservatives did not bear out his sweeping condemnation of

their use. Later our opinion was confirmed by the experiments of the board of referees. Accordingly, benzoate is now permitted to be used in small amounts for food preservation. But, altho Dr. Wiley's judgment was on this point overruled, it must be remembered that it was he who first put this much debated question to the test of experiment by his "poison squad," so that it could be settled instead of being merely discussed. It was fortunate for the country, therefore, that Dr. Wiley was Chief Chemist. It was fortunate also that Dr. Wilson was Secretary of Agriculture. Let us keep both of them.

## The New "Good Fellow"

ANOTHER sermon must be revised. It has been preached often and always with the same conclusion—beware of the 'good fellow." The phrase has been accepted as a synonym for roystering recklessness and irresponsibility. Pointed to as a dangerous influence upon the young, with no responsibility for the community's welfare, he has stood as an example of everything that should be avoided.

Now he comes to us in different guise. In hundreds of towns and cities, particularly in the West, there have been lately organized impromptu organizations of "good fellows." It required no initiation to join this company; the dues were voluntary, but the object was commendable. Instigated generally by some newspaper with a sense of helpfulness, the plea was sent out to join in an effort of good will for the children.

Somehow the appeal touched men as no preaching had done, and from the ranks of business men, of clerks, of farmers and of professional men was the response. Out of it have come picnics and outings for children of the side streets, automobile rides for inmates of poorhouses, flowers for sufferers in hospitals and definite relief for those crowded in tenements. On a holiday the "good fellows" remember the needy with gifts and messages of good cheer, all being without ostentation and having about it a fellowship and cheer that reveal the kindliness in the busy man's nature, waiting only to be awakened.

The average man, as this movement has shown, is unselfish. He may not care to parade before his fellows as a philanthropist, and very likely he has little desire to have his modest gift compared with those possible to the wealthy, but if he can do something to bring happiness to the world he may be "counted in." So does the average man like to be considered a good fellow. The weakness of the good fellowship has been that its energies were misdirected, that advantage was taken of the kind-hearted to lead them into paths where danger abounded. The philosopher who was shrewd enough to change the course and make impulse helpful, instead of harmful, did more good than he knew.

Not alone in this direction of direct giving may this sentiment be utilized. The good fellow may be led to do things for his community that go farther, if he can be brought to a sense of responsibility. To be sure, it is not always that the uplifting of the town or city appeals so concretely as does the home without bread. That is something that touches every heart. Yet there are other ways and places in which the good fellow is as much needed.

Suppose he were interested in making the boys of the town better men. Unfortunately, the small town usually lacks in opportunity for the boy who has no helpful home influence. In the city there are organizations, clubhouses, Y. M. C. A. buildings and other arrangements that bring him in touch with the larger life. In the village or the small town the boy who goes on the streets in the evening finds two places open to him, the pool hall and the saloon. What he learns there is well known. If remonstrated with for his choice of companions, the reply is, "Where else is there for me to go?" Where, indeed? The churches are closed except for religious service, the school rooms are dark. The business men have their clubs and their lodges; the boy is left to his own resources, or to those that are provided for him by evil influences.

Suppose the "good fellows" gave some of their effort and their money to taking care of the boys, to fitting up for them home-like clubhouses where they

could spend their spare evenings would they not be doing something worth while? The fact that the "good fellows" are exactly the men to whom the boys look with admiration would make it easier. They are the ones who would have the most influence in bringing about a change in viewpoint. It would take some time, of course, it would require some money and a little organization. Always are there men who would do the work if they could have back of them the hearty support of those who are the acknowledged leaders in the community's activities.

It is sometimes said that twenty men run every town, politically. So twenty men can give a new tone to the moral life of the town if they work together. Creditable as it is to be a "good fellow" on a single day, how much more would it mean if the good fellowship could be coined into everyday effort thru the whole year! The essence of the movement is in its freedom from cant and in its far removal from any appearance of open charity. It implies the utilization of the common goodness that lies deepest in men's hearts. The secret of accomplishing things for the betterment of society lies in awaking this substratum of humanity, as has been done by the plea for the neglected.

What cannot be accomplished with some by preaching, or by demands for charity, may be accomplished thru the very human touch of good fellowship. In it may be the germ for a vast helpfulness in which those unaffected by other means would join forces to bring permanent cheer and higher ideals of living. If the good fellows can be brought to realize their power and can be roused to exert it, they have in their hands a marvelously helpful instrument. The new "good fellow" should not confine his service to one day, but be a good fellow in the best sense of the phrase all the year.

## The Farmer and the Folk

According to the National Grange, the farmer receives about 35 cents of each dollar that his produce earns, while the 65 cents are absorbed by the numerous handlers of his product. The farmer is certainly entitled to get at the market in such a way as to have the 65 cents himself, and leave the 35 for those who only transfer his goods. The great American problem of today is how to bring the producer into closer contact with the consumer. Legislation should aim to remove everything that hinders the grower of a barrel of apples or a bushel of potatoes from placing them directly in the homes of those who can not produce them. The Constitution of New York State forbids any legislation that separates the producer and the citizen, but little has been done as yet to bring them into easy contact.

Middlemen, while constituting a necessary class, are often scattered over the country, intent on buying stock at the lowest possible figures, to be stored as long as necessary for their private advantage, and placed on the market at extortionate prices. The last Congress found in storage fourteen million beeves, six million calves, twenty-five million sheep and fifty million hogs. The annual value of stored meats in the United States is nearly two billions of dollars; that of dairy products one hundred millions, while stored fruits sum up fifty millions. Taking this with poultry, eggs, nuts and vegetables, and we find about two and a half billions of dollars stored to the disadvantage of both the grower and the consumer.

During the fall of 1910 apples were largely purchased from the farmer in the orchard, at $1.50 a barrel; but these very apples were sold in our city markets at $6.50 per barrel, and were retailed for over $9 per barrel. During this same fall the orange crop of Florida was bought up for 85 cents per box, but in the market was scarce at $2.50 to $3 for the common grades. The egg case is just as one sided, when the producer gets but 20 cents, while the consumer pays 40. Of course, the farmer who has cold storage of his own can command the higher prices, provided he also be prepared to directly reach the consumer.

Most of our farmers live a long way from market. The present market circle around our cities, within which there may be personal relations established between the grower and the buyer, does not exceed 15 miles in diameter. The

automobile will probably widen this circle two or three times over, making it possible for the producer to live 40 miles from market and yet deliver his goods before breakfast. The lesson to the farmer is a simple one; as far as possible have your private customers, especially for your perishable goods, your butter and your dairy goods, the truck from your garden and the fruit from your orchard. Then by rigid honesty create a demand for your brand, and make sure of your own market after you get it. The lesson for the American legislator is, Do what you can to clear the track of all hindrances that separate the man who makes a thing and the man who wants it. Let the Government do what it can to keep the grower well posted as to prices, and see to it that he gets the 65 cents for what he has the skill to create.

**Steel Railway Cars**

The terrible accident at Bridgeport, Conn., where six passenger cars of the chief express train from Washington to Boston jumped the track and fell to the street, calls for some serious comment. The engineer, who was responsible for the catastrophe, is dead, and it is of little use to say that he should not have forgotten to slow down when passing over the temporary roadway. Such blunders the human brain is liable to, and he has paid the penalty of his forgetfulness, if such it was, and not a reckless disregard of orders to make up lost time. When six long passenger coaches going at the rate of 60 miles an hour followed the engine down to the street below, one of them was a wooden car and was smashed into kindling wood. Of course, nearly every one in it was killed. The five sleeping cars were wholly of steel, frame, sides, floor, roof and all. That all the passengers in them were not killed was due to their construction. The passengers were flung about and many bones were broken, but one is glad to get off with broken bones if life can be saved. One of the chief horrors of railroad wrecks is that the cars will catch fire while the passengers are penned in and may burn to death. Steel will not burn as wood is liable to burn in such a case. So long as human nature cannot escape errors, and, with the utmost care, the perversity of inanimate things is a proverb, all railway passenger cars ought to be of steel, and the time is near at hand when a national law should require it for all interstate traffic, and State legislation should follow. Unfortunately, the States' rights doctrine in our Constitution requires forty-five legislatures to enact such a law for intrastate traffic.

**Made in America**

It is hard enough on us to be held responsible for all the exportations, commercial and human, going to Europe. But if we are also to get the blame for any unpleasant variations in the weather, the United States will become still more unpopular. Consequently the following item in the London *Times* is disquieting. If we could really get rid of a hot wave by sending it across the Atlantic we would not mind so much the damage to our reputation:

"Today the people of London, even those who most enjoy it, are grumbling at the 'heat wave,' which is popularly supposed to be a present from New York. Of late years the man in the street, having taken his fill of journalistic meteorology, has come to the conclusion (which he supposes to be a fragment of scientific truth) that all abnormal weather is produced in America and exported by the Americans. The remark heard yesterday morning on the top of an omnibus, 'Well, they are sending us a scorcher this time!' illustrates this popular belief excellently well; the speaker's physique resembled that of John Bull in the cartoons, and when he said 'they' he was referring to the people of the United States, or such of them as are responsible for the operations of the great Weather Trust which may or may not have been organized under the confiding laws of the State of New Jersey. His was a representative saying; he merely said what myriads like him, non-commissioned officers in London's vast industrial army, were thinking at the moment."

**Moving Pictures**

We have heard the kinetoscope held responsible for the disappearance of the melodrama and the decline of the lyceum, but it now seems that its encroachments extend still further. It is blamed for the failure of the coronation as a drawing show. The speculators in window privileges and grand stands along the route of the royal progress were hard hit. Seats that they offered in advance at guineas they were

glad to sell for shillings, throwing off the pound on the last day. More people went to London to see Edward buried than George crowned. On many streets "the thin red line of heroes" drawn up along the curb had no difficulty keeping back the loyal populace because the sidewalks behind them were not more crowded than every day. And the reason of it? What is the use, the people said, of standing half the night on the sidewalk when you can see the whole thing any time for tuppence? This week every American has substantially the same chance to see British royalty and nobility in motion as had those of his countrymen who crossed the ocean so as to be on the spot. The Kaiser, who realizes the importance of playing to the widest possible audience takes his personal kinetoscopist along with him wherever he goes. But in certain cases the presence of the motion-picture machine is embarrassing. The mob of French vine-dressers which raided the champagne depots a few months ago on account of the new labeling law marched thru the country with bands and banners at their head. This might not have mattered, but they went so far in their pride over their revolt as to enlist the services of a moving-picture man and this was their undoing. For when the agitation died down and the court proceedings began, there was none of the difficulty in getting witnesses usual in such popular demonstrations. The jurymen themselves were eyewitnesses of the smashing of champagne bottles and the stoning of the troops. On the wall of the courtroom the scenes of the riot were reproduced, fast or slow, or repeated as many times as desired, and the part played by each of the prisoners was made visible.

**Albanian Courage**

Those readers who have been surprised that the tribesmen of Northern Albania should dare to take up arms against the Ottoman Empire need to be reminded of their Byron. Two stanzas from "Childe Harold's Pilgrimage" will recall something of the history of unconquerable people:

Land of Albania! where Iskander rose!
Theme of the young, and beacon of the wise,
And he his namesake, whose oft baffled foes
Shrunk from his deeds of chivalrous emprise:
Land of Albania! let me bend mine eyes
On thee, thou rugged nurse of savage men!
The cross descends, thy minarets arise,
And the pale crescent sparkles in the glen,
Thru many a cypress grove within each city's ken.

Fierce are Albania's children, yet they lack
Not virtues, were those virtues more mature.
Where is the foe that ever saw their back?
Who can so well the toil of war endure?
Their native fastnesses not more secure
Than they in doubtful times of troublous need;
Their wrath how deadly! but their friendship sure,
When Gratitude or Valor bids them bleed,
Unshaken rushing on where'er their chief may lead.

**Rural Recreation**

L. H. Bailey, of Cornell University, foretells the time when every community will have a permanent place set aside for recreational enterprises. He thinks that where possible it should be a grove, and that it will be wise for every rural community to plant such a grove where one cannot be adopted. He insists that a regular playground is as legitimate a town affair as a town hall for public business. In some cases the local fair ground could be used for this purpose. He considers a town director of sports as important as an expert in teaching or in preaching—to teach the people how to live well and be happy. It might bring the doctors into efficient action, and ultimately the ministers will find capital work among the people on their playgrounds. This is evidently a long stride ahead for the first conception of the play movement. It begins to grapple with the whole social problem. But when all else is said, it remains to be found out that, as Froebel was right in saying, as play is incipient work, so work must in some way always retain the element or spirit, in order to make it acceptable and healthful. We may talk about playgrounds as a relief for work, or as a palliative for labor; it may be that so long as we have a false conception of work. There will be no permanent cure, however, until we have learned to dignify labor. The serious difficulty at present is that it is not honorable or noble to use the body in the way of achieving industrial ends. Our labor

organizations have got to be called into line, and they must lead us in the way of ennobling and honoring achievement. The chief end of man is not nine hours of work, or eight hours, or seven hours, but every hour filled with the glory of power to use the muscles and the brain for masterly purposes. We have strong faith that the playground movement and the drift toward a better conception of toil will go together.

**Pirate Gold**

Another expedition has gone to Cocos Island, off the Bay of Panama, in search of buried treasure; this time from no selfish motive, for the lady philanthropist who is in charge of the expedition proposes to devote the gold to the promotion of welfare work in London. We hope that she finds it, because it would add a fitting close to the romantic story if the treasure from the pillaged churches of Mexico and Peru should be disinterred for the relief of the submerged tenth in the London slums. An English pirate named Thompson started the fund by depositing twelve million dollars gold in the banks of Cocos, and later a Spanish pirate named Benito Bonito increased it by ten millions. Neither of them drew any out, but after the manner of pirates, each of them left a sketch map of the locality to a man who befriended him. We cannot place much confidence in any pirate named Thompson, but Benito Bonito sounds good to us. Besides, do we not hear of a man in 1875 who, in hunting over the island, fell into a grotto full of bars of bullion, pieces of eight and statues of gold and silver? If we lived in Panama we should spend all our holidays hunting buried treasure instead of alligators. It would be more romantic and quite as profitable. For instance, what became of those ingots that were stuck into the crab holes when Sir Francis Drake ambushed the treasure train going from old Panama to Nombre de Dios? There were 190 mules in the train, each bearing 300 pounds of silver. There was more gold than the pirates could carry away with them, so they hid the silver. It ought to be easy to find. We feel sure we could go right to the spot. It was on the old trail from Venta Cruz, near Cruces, on the Chagres, and so near to the town of Nombre de Dios, just east of Porto Bello, that the buccaneers, as they lay in the jungle to the southward, could hear the church bells and the hammers of the men driving the rivets on the ships which were to bear the tribute money to Spain. And then, again, what became of all the treasure of the old city of Panama, when it was destroyed by Sir Henry Morgan? The Spanish estimated their loss at more than $6,000,000, and it is no wonder that the pirates felt themselves cheated when they found they were to get only fifty dollars apiece for their hard work in crossing the isthmus, capturing the city and torturing the people to force them to tell where they had buried their wealth. And some of them would not tell, not even when their heads were squeezed and their feet roasted. Consequently a lot of it must be buried yet in and about old Panama; except the galleon, richer than all the rest, which got over to Toboga and there hid its treasure. To discover this cache would be a pleasant distraction to some convalescent on the island of Toboga.

**Government Clerks and Labor Unions**

Very frankly President Taft declares that Government clerks should not be allowed to belong to a labor union. He was talking not long ago to the railroad men at Harrisburg, and he told them there could be no objection to Government employees forming their own organizations for mutual betterment, but to join the Federation of Labor, and then use that organization as a power by its system of boycotts and strikes to force Government to come to their terms as to wages and other conditions, opens a very serious question, and he cannot approve it. He calls attention to the condition in France, where the Government employees struck and utter confusion followed. The President shows that to allow the employees of Government to strike is to recognize revolution as a lawful means of securing an increase in compensation for one class, and that a privileged class, at the expense of all the public. Inasmuch as the Government employees are a privileged class whose work is necessary to carry on the Government,

upon their entry into the Government service it is, as the President says, entirely reasonable to impose conditions that should not be and ought not be imposed upon those who serve private employers. We ought to have no such difficulties here as have made chaos for a time in France and Italy.

The condition of the depressed sections of our people, of whatever race, is likely to find improvement if it attracts such careful attention as Professor Brooks, of the University of Georgia, has been giving to the condition of the negroes in a number of counties. He finds that in sections inhabited chiefly by negroes their condition is much lower materially, morally, and educationally than in sections where the whites predominate. His conclusion is, that white immigration is needed in the black belt so as to raise the negro. But it is also to be considered whether the big plantations and the renting system is not one chief factor, and the inferior schools allowed the negroes another.

It is past all question that the vast annual production of gold from the mines is a principal cause of the rise in prices. Last year there was taken out of the earth the vast amount of $466,000,000 in gold, of which $177,000,000 came from Africa, $96,000,000 from the United States, and $67,000,000 from Australia and New Zealand. While a portion of this immense sum goes into the arts, the most of it is added to the basis of monetary expansion, which means increase of prices, in so far as increase of business does not keep pace with the increase of production.

The Bishop of Hereford kept his promise, and invited dissenting Christians to unite with him in a union celebration of Holy Communion in connection with the Coronation season. Several hundred attended, representing other Protestant bodies, and the bishop in an address strongly defended his invitation as in the true line of the practice of his Church. Now, why should not some of the leading Baptist, Congregational or Wesleyan ministers give such an invitation to the bishop and his clergy, and let us see the act of courtesy completed.

We are heartily in sympathy with the proposal of the Postmaster General of Australia to establish a penny postage with the United States. We have the penny postage with England, and Australia must soon follow. The next step will be a one cent postage for domestic letters in the United States and finally a one cent postage for the world. In stimulating better mail facilities, the nations of the world are brought more intimately together.

The number of Cardinals is now reduced by death to forty-nine out of a possible seventy, and yet the Pope calls no consistory. The serious sickness of Cardinal Gotti, Prefect of the Propaganda, puts additional work on those who are not too old and feeble to attend to their duties. The Pope's own health is by no means strong, and he is seventy-six years old. Three or four American Cardinals would properly help fill the vacancies.

Sir Wilfrid Laurier, on his return from the Imperial Conference in London, received a more enthusiastic welcome at Quebec and Montreal than has ever been given to any other man. It does not look as tho the septuagenarian Premier had lost any of his popularity thru his frank advocacy in England of reciprocity and Canada's right to manage her own affairs.

We quote this amazing statement from the Boston *Pilot*. Can it be that any one will swallow it?

> "As an organized protest, Protestantism has accomplished nothing, and must in the natural course of events break up."

It has accomplished a good deal; and so far from breaking up it is uniting and consolidating.

If Congressman Victor Berger succeeds in his efforts to get the Post Office Department to permit the letter carriers to leave off their coats this hot weather, the Socialist party in Congress will have set a good example to the older parties in the way of actually accomplishing reforms.

# Insurance

## The Public Health Movement

In a recent interview published in the New York *Times*, some very interesting statements are made by E. E. Rittenhouse, formerly president of the Provident Savings Life Assurance Society, and recently appointed by President W. A. Day, as head of the conservation department of the Equitable Life Assurance Society. Mr. Rittenhouse called attention to the fact that American life insurance companies are paying out $150,000,000 a year for death claims. This is a rate of about $12 per thousand of insurance in force. If this rate could be reduced to $11 per thousand it would mean a saving to the insurance companies of $12,500,000 a year. Despite the importance of public health, Congress appropriated only $15,000,000 out of $1,122,000,000 in 1909 for this purpose. Prof. Irving Fisher, of Yale, estimated that 600,000 human lives are needlessly sacrificed in the United States every year, and that over 40 per cent. of the annual death roll is chargeable to diseases that could be avoided or postponed by the application of reasonable and timely preventive measures. He also estimated that there are constantly about 3,000,000 persons seriously ill in the United States, more than one-half from preventable diseases.

The loss of adult American life thru the more important non-communicable diseases has increased with remarkable rapidity. Allowing for the increase in population, about two persons die now where one died thirty years ago from preventable or postponable diseases of the heart, kidneys and brain. The most important protective measure is found in periodical medical examinations, whereby the first symptoms may be discovered and cured in an early stage.

Our Government spends hundreds of millions of dollars annually in maintaining military and civil forces on land and sea to protect life and liberty. It also disburses public funds to save arid lands, to save the forests, to save wild animals from useless slaughter, and to save hogs, cattle and other domestic animals from disease. It has required transportation companies and other employers to spend millions in safety devices to prevent the accidental loss of human life. It prohibits food adulteration and maintains a national health organization to guard the public against the entrance of epidemic disease from other countries.

It is the true function of the state to do all these things, to assist our people in the general pursuit of happiness. It should also be a very important function of the Government to assist and prolong the lives of people who are threatened with preventable maladies.

The life insurance companies have a great advantage in giving advice, for the people know that the only way the companies can save money is by saving lives. The policyholder is willing to benefit the company, because he must first benefit himself.

A bill has been passed in Wisconsin allowing the city of Milwaukee to establish an insurance fund for its public school buildings. It is planned to raise $25,000 a year by taxes, until $100,000 is accumulated, and then reduce the tax to $12,500 until $200,000 is reached. Thereafter the tax can be regulated to meet losses beyond the interest from the fund.

The Ætna Life Insurance Company and the Ætna Acident and Liability Company, of Hartford, have opened a new branch office in Philadelphia, for the transaction of liability and miscellaneous casualty business. Mr. John E. Elley, formerly of Chicago, has been appointed manager.

During the last five years $21,677,921 has been paid in to the capital and $11,743,415 to the surplus of stock life insurance companies organized in the United States. The total dividends paid amounted to $220,337.

## Our Railroads

THE forty-fourth annual number of *Poor's Manual of Railroads* was issued last week. Its statistics relate to the calendar year 1910 and preceding years. The number of miles of main track constructed last year was 3,751, against 6,340 in 1909, and the total is now 242,107. With second track, third track and sidings added, it is 349,870. Some of the figures are shown in the following table:

| | 1909 | 1910 |
|---|---|---|
| Capital stock | $8,030,080,903 | $8,380,819,190 |
| Bonded debt | 9,118,103,813 | 9,600,634,906 |
| Cost of road and equipment | 14,514,822,308 | 15,580,829,836 |
| Stocks and bonds owned | 3,084,387,008 | 3,518,744,500 |
| Gross earnings | 2,513,212,763 | 2,804,580,939 |
| Operating expenses | 1,661,059,483 | 1,885,520,627 |
| Net earnings | 852,153,280 | 919,060,312 |
| Dividends | 265,162,298 | 275,289,173 |
| Passengers carried | 924,421,638 | 998,735,432 |
| Freight, tons | 1,635,215,800 | 1,817,766,030 |
| Passenger receipts | $578,243,601 | $640,949,990 |
| Freight receipts | 1,720,863,413 | 1,940,335,111 |
| Miles of road | 238,356 | 242,107 |

The average receipts, in cents, for freight per ton per mile were .753, against .757 in 1909, .765 in 1908, and .782 in 1907. Revenue per passenger per mile, in cents, fell from 1.978 to 1,934. Increase of net earnings was 7.85 per cent., against 18.72 per cent. in 1909.

## The Crops

A HIGHLY favorable report concerning the cotton crop has been followed by a somewhat disappointing one about grain, vegetables, tobacco and hay. This later report (for July 1, but issued ten days later) shows the effect of June's hot and dry weather. Condition rapidly declined, winter wheat from 80.4 to 76.8; spring wheat from 94.6 to 73.8; barley showed only 72.1 instead of 92.2; hay was 64.9, tobacco 72.6, and the figures for potatoes (with a decreased acreage) were 76.6, or far below the ten years' average. These changes reduce the estimated yield of wheat by 62,000,000 bushels, that of oats by 159,000,000, and point to a loss of 28,000,000 for barley. Corn's condition was 80.1, against 85.4 a year ago, and a ten years' average of 84.7, but allowance must be made for an increase of nearly 2,000,000 acres. Oats fell to 68.8 from 85.7 on June 1. The average for ten years had been 80.3. The yields indicated by these changes and the quantities harvested last year, are shown below:

| | Indicated for 1911 | Harvest, 1910. |
|---|---|---|
| Corn | 2,956,445,000 | 3,125,713,000 |
| Winter wheat | 457,958,000 | 464,044,000 |
| Spring wheat | 244,933,000 | 231,399,000 |
| Total wheat | 702,891,000 | 695,443,000 |
| Oats | 817,800,000 | 1,126,765,000 |
| Rye | 31,062,000 | 33,039,000 |
| Barley | 147,094,000 | 162,227,000 |
| Potatoes | 285,541,000 | 338,811,000 |
| Tobacco, lbs. | 624,542,000 | 984,349,000 |

Tobacco acreage has been reduced by 28 per cent., and there will be only about two-thirds of a normal crop of hay. In some parts of the country, however, condition has been improved by rains since July 1. The Department of Agriculture publishes the following comparisons:

"Taking into account both acreage and condition, indications are that the wheat crop will be 1.4 per cent. larger than the average production of the past five years, corn 4.9 per cent. larger, oats 12.3 per cent. less, barley 11.6 per cent. less, potatoes 10.8 per cent. less, tobacco 22.7 per cent. less, flax 10.5 per cent. more and rice 5.8 per cent. more.

Reports from Canada are very favorable. Quebec Province will make a new high record in grain and hay. The new Northwest promises 95 per cent., against 82 last year, and the number of acres given to flax has been increased by 300,000.

....British Consols, still declining, touched 78¼ on the 11th, the lowest price for eighty years.

....In the fiscal year which ended with June, our exports were $2,048,691,392, and our imports $1,527,985,088, against $1,744,984,720 and $1,556,947,430, respectively, in 1910.

....Philadelphia offered $9,750,000 of 4 per cent. thirty year bonds last week, but awarded only $3,534,000, at a shade over 101. A syndicate bid from Drexel & Co. and Brown Bros. & Co., for the entire amount at 100.1528, was rejected.

VOL. LXXI NEW YORK, THURSDAY, JULY 27, 1911 No. 3269

## Survey of the World

**Final Passage of the Reciprocity Bill**

In the Senate, on the afternoon of the 22d, the bill approving and confirming the agreement with Canada for tariff reciprocity was passed by a vote of 53 to 27. Voting upon proposed amendments and the bill consumed two hours and a half. The bill as passed is the House bill, without change. On Wednesday of this week, after the signatures of the Speaker and the Clerk of the House have been obtained, it will be signed by the President and will become a statute. Only that part of it, however, that provides for the free entry into this country of print paper and of wood pulp not affected by export charges will go into effect at once; the remainder must wait for the approval of Canada's Parliament. Action at Ottawa has been prevented by the obstruction of the Conservative minority. It is now expected that Parliament will be dissolved, possibly within two weeks; that the Government will appeal to the people at a new election, probably in October, and that at this election the desire of a large majority of Canada's voters for approval of the agreement will be clearly exprest. In the Senate, on the 22d, sixteen amendments were offered and rejected. Nearly all of these were proposed by Republican insurgents or by Mr. Bailey, of Texas, and Mr. Simmons, of North Carolina, two of the three Democrats who opposed the bill. Most of them called for additions to the agreement's free list. Several of them were rejected by a vote of 16 to 64, and all the votes were in the neighborhood of these figures. Mr. La Follette's wool revision bill, which he will ask the Senate to substitute for the Underwood bill, sent over from the House, was offered as an amendment and rejected, 15 to 64. His cotton goods bill shared the same fate. Mr. Bailey offered the Farmers' Free List bill (passed by the House) with some modifications, and saw it laid aside by a vote of 15 to 63. Those counted for the Reciprocity bill on the final vote were three insurgents (Messrs. Brown, of Nebraska; Poindexter, of Washington, and Works, of California), eighteen regular Republicans, and thirty-two Democrats. Those against it were three Democrats (Messrs. Bailey, of Texas; Simmons, of North Carolina, and Clarke, of Arkansas), twelve insurgents and twelve regular Republicans. As some have asserted that the press favored the bill because of its provisions concerning print paper, it is pointed out that four of the five owners or publishers of newspapers, Messrs. Oliver, La Follette, Bristow and Dixon, voted in the negative. Mr. Hitchcock, the fifth, was counted in the affirmative. After the vote, Mr. Penrose exprest the opinion that Congress would adjourn not later than August 10.——The agreement was sent to Congress by the President on January 26; the confirming bill was passed for the first time in the House (221 to 93) on February 14, and the second time (267 to 89) on April 21; it was referred to the Senate committee on April 24, and the debate in the Senate began on June 14.——There were several speeches on the bill last week. Mr. Brown, of Nebraska, quoted from speeches made by several of his insurgent associates in the tariff debate of 1909, reading passages directly in opposition to their recent assertions and arguments. Mr. La Follette attacked the press because it had supported proposed legislation in which it had a direct pe-

contest in court. He also continued his attack upon President Taft.——By agreement, final votes upon the Wool and the Farmers' Free List bills are to be taken this week. Predictions as to the fate of the first differ; some think that Mr. La Follette's substitute will be accepted, and that a conference bill will be passed and sent to the President. The failure of the second bill is expected. There seems to be good authority for the assertion that if a bill revising the wool and woolen schedule should be laid before the President he would veto it.

**Federal Regulation of Trusts**

Addressing a convention of the Minnesota Bar Association at Duluth, on the 19th, Attorney-General Wickersham said that a Government commission to regulate great industrial corporations engaged in interstate trade, as the railways are regulated by the Interstate Commerce Commission, was much to be desired and might be absolutely necessary; also, that it would be a question for serious consideration whether such a commission should have power to regulate prices. At the beginning he referred to the recent advocacy of such official regulation by "the representatives of some of the largest combinations of capital, probably as a means of salvation." The Department of Justice, he continued, dealt only with violations of the law; a commission's activities would be exerted to prevent violations. Congress might declare a rule like that prescribed by statute with respect to railroads, that prices should be reasonable and that there should be no unjust discrimination. This would be only a new application of the principle in accordance with which transportation rates are subject to official regulation. The Sherman act and similar State laws were based on the theory that the natural price of an article is that which is fixed by the operation of the natural law of supply and demand, working without artificial restraint. "But the fact is," said Mr. Wickersham, "that the law of supply and demand does not work and has not for many years worked in this country in a natural, unrestrained and unfettered manner." Artificial restraint was imposed by the tariff:

> "And of this all it is probably safe to say that in almost every one of the great staple industries prices have been for years fixed by agreement between the principal producers and not by the normal play of free competition, even among the domestic producers, nor by the unfettered operation of the law of supply and demand. The fact seems to be that the prices of standard articles of consumption sold in the United States for a number of years past have not been fixed at all by the operation of the laws of supply and demand or of unrestrained competition, but by associations of the producers, without the participation of the consumer or the general public—that is, without those who have had to pay the bill having any voice in fixing the price. In this view it is certainly not unreasonable that the purchasing public should desire to have some part in determining the price it is to pay—in like manner as has been recognized to the just with respect to the cost of transportation."

The supervision of a Federal commission was certainly desirable, if not absolutely necessary, for the effectual regulation of those who are willing to violate the law by taking advantage of conflict between State laws and Federal statutes, and of those who desire to obey the law, but are in doubt by reason of this conflict and of the complexity of State laws. The practical difficulties in the way of so exercising power over prices as not to cause a greater evil than the one for which a cure was sought were so great that perhaps they were insurmountable. Restraint of trade and the growth of monopoly had been greatly facilitated by "departure from the early rule of law that one corporation cannot own stock in another." The ax would be laid at the root of the Trust evil if Congress should forbid any corporation engaged in interstate commerce to acquire stock of any other corporation so engaged, and should require corporations now owning the stock of others to dispose of it within a specified period.——Speaking at Hancock, Mich., two days later, he said he was confident that the great Trusts condemned by the Supreme Court's recent decisions would "be split up into a number of separate and distinct parts, no one of which shall have any connection with or control over any other, and no one of which shall have so large a percentage of the business as to be anything like a monopoly." Nothing less would meet his interpretation of the Supreme Court's decisions.

**New Arbitration Treaties**

In the course of a brief address, on the 21st, at the Bull Run battlefield, to veterans of both armies, President Taft announced that a general arbitration treaty with France, like the one with Great Britain, would soon be signed, and that three other nations were about to enter into similar agreements. Having said that men who had fought in war knew what it was and wanted no more of it, he continued:

"Therefore I look to you veterans of the Civil War to aid in the movement for peace. I am glad to announce here today that as England has agreed to enter into an arbitration treaty with the United States, France has signified her willingness to enter into the same treaty. Both treaties will be signed within ten days, and I expect to be able to announce within a few days that three other nations have entered into the agreement. This news I bring to the veterans of a real war, because I know they will most appreciate permanent peace."

He did not name the three additional nations, but it is thought at Washington that they are Germany, Holland and Sweden. Japan may eventually join them, but negotiations with that nation are said to have been thus far only tentative. The signing of the treaties with Great Britain and France will not be delayed by the absence of Ambassadors Bryce and Jusserand from Washington. The first will sign at his summer home in Maine, and the second in Paris. If the signatures can be attached and the official copies exchanged in time, the treaties will be submitted to the Senate for ratification before the end of the present session of Congress.

**No Intervention in Cuba**

Owing to reports in Cuba that the approaching visit of the Secretary of War had been suggested in connection with plans for intervention, President Taft, on the 18th, directed Secretary Knox to send to the American Minister at Havana, for publication, a statement in which, after reference to these reports and the expression of a desire "to put an end, once for all, to unwarranted political innuendo," he said:

"The work of raising the 'Maine,' which has been carried on by army engineers, was something which the Secretary of War naturally desired to inspect, and it was deemed more convenient that the Secretary of War and his party should in returning from Panama take advantage of the occasion to pay a friendly visit to the republic of Cuba, the best interests of which the United States has so deeply at heart, and to exchange courtesies with the Cuban Government. The Government of the United States has thought it not worth while to deny the false stories of possible intervention which have been circulated in certain sections of the press, the fact being that no such question has been the subject of consideration by that Government, whose sole concern in relation to Cuban affairs in recent years has been that in the rapid development of the splendid resources of Cuba, which will be viewed in the United States with so much pleasure, the process of exploitation should be ever safeguarded by that wise and deliberate economic policy so essential to financial and political stability."

Giuseppe Garibaldi, who was a commander under Madero in Mexico, says he has been invited to do similar work in Cuba.——Andre, owner of the anti-Government paper, *El Dia,* in Havana, has been sued for criminal libel by President Gomez's secretary and General Monteagudo, head of the Rural Guard, the paper having asserted that both were being enriched by corruption.

**Unhappy Condition of Mexico**

There is fear in Mexico of another revolution or of civil war. In many places there have been bloody controversies between Federal soldiers and the Maderist troops, who refuse to lay down their arms, being dissatisfied with their pay. Some of these Maderists have joined the Magonist brigands, one party of whom was raiding ranches west of El Paso last week, while another was threatening the city of Parral. Labor conditions cause unrest. Many industries in the north are paralyzed. By August 1 all the coal mines in Coahuila will be closed, it may be for several months. Thus 30,000 men will be thrown out of work. Salvador Madero, the leader's uncle, who employed 6,000, closed his mines last week. The bakers' strike in Vera Cruz, followed by a large increase of wages, has nearly doubled the price of bread there. Maderist leaders complain that De la Barra is weak and negligent. The leader's brother Gustavo holds him responsible for the killing of so many persons at Puebla, week before last. General Rascon, Minister of War, and his assistant, have resigned. Madero, thrilled

Henry H. Rogers, Chairman of the Standard Oil Company, has been elected a director of the Union Pacific Railroad Company, to succeed the late Edward H. Harriman.

Mr. Rogers is a director in the Standard Oil Company of New Jersey, the Standard Oil Company of New York, the Anaconda Copper Mining Company, the Amalgamated Copper Company, the Rogers Locomotive Works, the Virginia Iron, Coal and Coke Company, the Tennessee Coal, Iron and Railroad Company, the Consolidated Gas Company of New York, the Equitable Life Assurance Society, the Chase National Bank, the Hanover National Bank, the National City Bank, the Bankers Trust Company, the Guaranty Trust Company, the Mercantile Trust Company, the Metropolitan Trust Company, the Standard Trust Company, the United States Trust Company, the Western Union Telegraph Company, the Mutual Union Telegraph Company, the Postal Telegraph-Cable Company, the Commercial Cable Company, the Commercial Cable Company of Canada, the Commercial Pacific Cable Company, the Mackay Companies, the Atlantic Mutual Insurance Company, the Home Insurance Company, the Standard Fire Insurance Company, the Trinity Church Corporation, the Metropolitan Museum of Art, the Museum of Natural History, the Lenox Library, the Astor Library, the Rockefeller Institute for Medical Research, the Rockefeller Foundation, the General Education Board, the Union Theological Seminary, the Barnard College, the Vassar College, the Wellesley College, the Spelman Seminary, the Atlanta University, the Hampton Institute, the Tuskegee Institute, the Yale University, the Yale Corporation, the Yale Alumni Board, the Yale Alumni Weekly, the Yale Daily News, the Yale Graduates' Magazine, the Yale Graduates' Quarterly, the Yale Graduates' Weekly, the Yale Graduates' Monthly, the Yale Graduates' Annual, the Yale Graduates' Directory, the Yale Graduates' Catalogue, the Yale Graduates' Register, the Yale Graduates' Handbook, the Yale Graduates' Guide, the Yale Graduates' Manual, the Yale Graduates' Encyclopedia, the Yale Graduates' Dictionary, the Yale Graduates' Thesaurus, the Yale Graduates' Concordance, the Yale Graduates' Index, the Yale Graduates' Table of Contents, the Yale Graduates' Bibliography, the Yale Graduates' Appendix, the Yale Graduates' Supplement, the Yale Graduates' Addenda, the Yale Graduates' Errata, the Yale Graduates' Corrigenda, the Yale Graduates' Emendations, the Yale Graduates' Revisions, the Yale Graduates' Amendments, the Yale Graduates' Alterations, the Yale Graduates' Modifications, the Yale Graduates' Changes, the Yale Graduates' Variations, the Yale Graduates' Differences, the Yale Graduates' Distinctions, the Yale Graduates' Peculiarities, the Yale Graduates' Characteristics, the Yale Graduates' Features, the Yale Graduates' Qualities, the Yale Graduates' Properties, the Yale Graduates' Attributes, the Yale Graduates' Accidents, the Yale Graduates' Modes, the Yale Graduates' Forms, the Yale Graduates' Species, the Yale Graduates' Genera, the Yale Graduates' Orders, the Yale Graduates' Classes, the Yale Graduates' Phyla, the Yale Graduates' Kingdoms, the Yale Graduates' Domains, the Yale Graduates' Universe, the Yale Graduates' Cosmos, the Yale Graduates' Infinity, the Yale Graduates' Eternity, the Yale Graduates' Absolute, the Yale Graduates' God

DEAR MR. BALFOUR—I think it is courteous and right, before any public decisions are announced, to let you know how we regard the political situation. When the Parliament bill, in the form which it has now assumed, returns to the House of Commons, we shall be compelled to ask that house to disagree with the Lords' amendments.

In the circumstances, should the necessity arise, the Government will advise the King to exercise his prerogative to insure the passing into law of the bill in substantially the same form in which it left the House of Commons, and His Majesty has been pleased to signify that he will consider it his duty to accept and act on that advice.

Yours sincerely,
H. H. ASQUITH.

The object of this disclosure was doubtless to prevent the recalcitrant members of the House of Lords from going to extremes in their opposition to the bill. Some, however, are still determined to put up a fight. Prominent among these is Lord Halsbury, who, in spite of his eighty-six years, made a passionate speech in defense of the privileges of the Lords on the third reading of the bill, in the course of which he said:

It has been suggested that the King has been applied to to make as many Peers as are necessary to force the bill thru this House. To put it plainly, I regard the suggestion as a gross violation of Parliamentary decency. When I was a young man the King's name was seldom mentioned. After the bill is passed this will be a mere apparition of the House of Lords. It would be long before I would consent to sit in such an assembly.

"The people outside do not know what is going on. They do not know that the Constitution and the country are in peril, as well as the lives and liberties of his Majesty's subjects. It is the most momentous legislation I have come across in sixty years' experience in politics. It is an attempt of one house to abolish the other. It is not a question of party; it is a question of the life or death of the Constitution."

**French Labor Troubles**

The workmen's pension law, which came into force this month, is meeting with stubborn resistance from the class it was intended to benefit. The "Syndicate" or Central Federation of Labor is conducting a vigorous campaign against it, and organized riots have broken out in many places. At Troyes a mob of 10,000 union men attempted to storm the prefecture, and the soldiers had great difficulty in driving them back. According to the law the employer, when he pays the wages, is obliged to put upon the card of the employee stamps representing the contribution of both parties to the pension fund. In many places the workmen failed to register for pensions and refused to take out cards. Embarrassment was also caused by the failure of the Government to provide the cards and stamps in sufficient numbers at the time needed. On account of these impediments the employers in some cases paid over the wages in full and in others kept back an amount equivalent to the pension contributions. The farm laborers commonly resent the contributions required as a new kind of Government tax, and altho the new law applies to domestic servants, housekeepers generally are reluctant to put it into operation. On the 1st of July, when the law went into effect, the Minister of Labor reported that the number of workmen and peasants registered was 5,417,978. Of this number over a million and a half had themselves made application for registration. The total number of persons to whom the law is applicable was estimated in advance at about 12,000,000. The national council of the Unified Socialist party has declared against the pension law, objecting particularly to the requirement of contributions from the workingmen, the small amount of the pension, the advanced age at which the pensions become receivable, and the use of the identification book, stating the employment and wages of the individual during his whole life. In the discussion of the subject in the Socialist council, M. Jaurès protested vigorously against this repudiation by the Socialist party, declaring that it had been carried by the aid of the Socialist members of the Chamber of Deputies, who were definitely instructed by the Socialist congress of Nimes to vote for it, and that it would be dishonorable for the party now to repudiate it and interfere with its application. He was opposed and defeated, however, by his old antagonist, M. Guesde, who declared that it was contrary to the Socialist principles to require contributions from the workingmen, and that the Socialist party would assume no responsibility for a bourgeois government.——The building trades of Paris declared a general strike on July 9, which is still on. About 5,000 men are out and numerous cases of assault on those who continue work

are reported. The sabotage on the state railroads continues to impede traffic and make travel dangerous. Between October and July, 2,930 cases of malicious mischief on the railroads have been reported, and only two men have been brought to trial. Wires are cut, telegraph posts sawed thru and signals displaced with alarming frequency. Many attempts have been made to wreck trains by placing stones, ironware or boards across the track. At Chartres the railway superintendent saw three men place a large wooden beam on the track outside the station in the afternoon. One of the men was a soldier belonging to the 102d Regiment. This indicates the extent to which the anti-militarist propaganda has found favor in the army.

**The Morocco Question**

The series of conversations intended to settle the status and future of Morocco was begun in Berlin on July 9 between the French Ambassador, M. Jules Cambon, and the German Secretary of State for Foreign Affairs, Herr von Kiderlen-Waechter. Nothing concerning their tenor is officially given out to the public, so the accounts of the progress of the negotiations published in the newspapers are largely speculative. It is said that Germany has made a demand for compensation on an astonishingly liberal scale for relinquishing its claim upon Agadir and other Moroccan territory; nothing less than the cession of the coast of French Kongo as far back as the Sanga River, with the contingent reversion of France over the Kongo state. This would cut off the French possessions from the sea and open the way for an extension of German Kamerun over a large part of central Africa. This demand is regarded as preposterous in England as well as in France, and has revived English sympathy for France, which hitherto has been noticeably less cordial than it was in 1906, when the two countries were prepared to stand together against Germany even in the event of war. This feeling found expression quite unexpectedly in a speech made at a Mansion dinner to Lombard street financiers by the Chancellor of the Exchequer. Since Lloyd-George is a decided peace man and not directly concerned with foreign affairs, his carefully prepared remarks on this point, quoted below, are regarded as a significant declaration of the intention of the British Government to support France in this crisis:

"I believe it essential in the highest interests, not merely of this country, but of the world, that Great Britain should at all hazards maintain her place and prestige among the great Powers. Her potent influence has been many times in the past, and may yet be in the future, invaluable for the cause of human liberty. It has more than once in the past redeemed Continental nations, who are sometimes too apt to forget that service, from overwhelming disaster and even from national extinction.

"I would make great sacrifices to preserve peace. I conceive nothing that would justify the disturbance of international good-will except questions of the gravest national moment; but if a situation were to be enforced upon us in which peace could only be preserved by the surrender of the great and beneficent position that Great Britain has won by centuries of heroism and achievement—by allowing Great Britain to be treated where her interests were vitally affected as if she were of no account in the cabinet of nations—then I say emphatically that peace at that price would be a humiliation intolerable for a great country like ours to endure."

——The German gunboat "Panther" has not been withdrawn from the harbor of Agadir, as was announced, but remains there, together with the gunboat "Eber" and the cruiser "Berlin." The German officers are said to be making hunting trips into the mountains.—— Since the occupation of Alkazar by the Spanish troops there have been many complaints of friction with the French there. The French consular agent was arrested by the Spanish patrol for carrying a rifle and conducted to the police station. The Spanish Government has exprest its regrets for the mistake. Later a French lieutenant who was trying to stop some deserters from his native force was seized and maltreated by Spanish soldiers. For this also the Spanish Government has apologized.

**Revolt in Persia**

The Persian Government has an insurrection on its hands which is likely to prove serious, since it is headed by Mohammed Ali Mirza, the deposed Sultan, and apparently backed by Russia. In 1909, when the Constitution

alists captured Teheran, he took refuge in the Russian legation and was allowed to leave the country under Russian protection. The new Government having made his little son Shah, granted him a liberal pension on condition that he refrain from intrigue, and the Russian Government formally pledged itself to "take effective measures to prevent political agitation against Persia." The exiled Sultan, who is only thirty-nine years old, has been living in Odessa, but left there some weeks ago, by permission of the Russian Government, for Baden, near Vienna, on account of his health. A week ago his brother, Salar Ed Dowleh, instigated a rising at Hamadan and proclaimed him Shah. Shiraz, Kermanshah and other cities of Western Persia are also said to be in revolt. Suddenly Mohammed Ali appeared at Astrabad, having been conveyed across the Caspian Sea by a Russian vessel and landed at the obscure port of Gumesh Tepe. According to St. Petersburg despatches the ex-Shah was received with wild enthusiasm by the people of Astrabad, and will soon march to the capital. The Government had already sent 2,000 Bakhtiari troops against Salar Ed Dowleh and his Kurdish insurgents in the West, so it is not in a condition to withstand an attack from the east by Mohammed Ali and his Turcomans. But the Government, with the approval of Parliament, has proclaimed martial law and is raising a volunteer force to march against the dethroned Shah. A Russian force is being mobilized at Tiflis to occupy the Province of Azerbaijan. Tabriz is still occupied by a Russian garrison, and Kasvin and Ardebil have never been evacuated since their occupation by the Russians over two years ago. The Russian papers declare that constitutional government has proved a failure in Persia, and that the time has come for Russia to assume full control of northern Persia. In the south the British are increasingly active. A British field force is operating in Baluchistan and Southern Persia in order to prevent the telegraph line from being destroyed by predatory bands and guns from being imported into Afghanistan. Within the past month Afghans have been sending caravans across Persian territory to the Gulf of Oman and the Persian Gulf to receive importations of arms from Europe, and now they are well supplied with modern guns and ammunition, so the next time the Indian army has to invade Afghanistan it will be a more serious affair than ever before. The arms, some of which are made in England, are first shipped to Omân, port of Muscat, and from there smuggled by native boats to points on the other side of the gulf. France is unwilling to give the British control over the trade of Muscat, so the best they can do is to try to catch the gun runners as they leave or land. The coast is now patrolled by a British squadron consisting of five cruisers, besides smaller vessels, and very few *dhows* escape being overhauled and searched. This watch has now been kept up for over a year, and in that time 14,000 rifles and 2,000,000 rounds of ammunition have been seized, and more has been thrown overboard to avoid capture.

**Foreign Notes**

Rumors are renewed of an impending invasion of Portugal by the monarchists. Captain Couciere is said to have collected a well armed and well drilled force on the northern border without serious opposition from the Spanish Government. When they cross the border a rising of monarchists in the various cities of Portugal is expected. The Government is sending troops in large numbers to Braga and has asked the Cortes for a credit of $1,500,000 for the national defense. In retaliation for the encouragement given by the exiled King to these counter revolutionary movements, the Government proposes to sell the royal estate, expecting to realize $5,000,000 from the property. Amnesty and freedom of residence has been offered by the Government to all exiles who within forty days present themselves before the Portuguese consuls in the countries where they reside and declare their allegiance to the republic. At Coimbra disorders have occurred on account of a strike of the residents in the university there, due to political causes.——A fire which broke out in the Stamboul quarter of Constantinople during the celebration of the anniversary of the constitution destroyed a large part of that section of the city.

# Recognition

BY MRS. FRANK A. BRECK

To have a soul so sensitive it sees a breaking heart
Where others see a flippant smile, suspecting not the smart;
To have the sympathy to know when secret cares oppress,
The burdened ones fling out no sign proclaiming their distress;
To recognize the inward shame that shows not in the face—
The hint of bitterest remorse that others would not trace;
To see the disappointment keen where no complaint is heard,
But hides itself in shadow like a wounded, bleeding bird;
To see the galling of the chains that hold a soul in thrall,
To know the desperation of the baffled ere they fall;
To see the degradation of the soul that good defies,
To feel the sinfulness of men as smoke will pain the eyes;
To know all this—to reach and teach—to cheer and love and soothe,
To touch to life—to lead the weak along a pathway smooth;
To show the heart uncomforted where grief and burdens cease,
To lead the sinning and the sad to purity and peace;
To make earth's darkened, narrowed ways all radiant and broad—
Oh, this is love and righteousness—the life that lives for God.

Hoboken, N. J.

# The Morocco Question

BY SYDNEY BROOKS

[The ultimate responsibility for deciding what shall be done about Morocco has by the exigencies of the situation been thrown upon Great Britain and this article by a well-known writer on international politics shows how the situation now looks from the standpoint of London.—EDITOR.]

IN its modern form the Morocco question is seven years old and may be said to date from the Anglo-French agreement of 1904. But in all its essentials it ranks among the most venerable of European problems. Over a hundred years ago it fixt the attention of Nelson. Bismarck, soon after the Franco-Prussian war, singled out Morocco as "a certain bone of contention" between the Powers; and twenty years ago Lord Salisbury prophesied that it would be "as great a trouble to Europe and as great a menace to the peace of Europe as the other Mohammedan countries farther to the east used to be twenty or thirty years ago." Both forecasts have come true. Within the last four years the problem of Morocco has brought Germany and France to the very verge of war. It has now been reopened again by the French expedition to Fez, by the Spanish occupation of Alcazar, and especially by the dispatch of a German cruiser to Agadir. A new situation has been created, and one that will not be closed, even temporarily, without some difficulty and many anxious moments of apprehension, while the most hardened political speculator would hesitate to prophesy the lines along which the permanent solution of the Morocco question, if there ever is any permanent solution, will resolve itself.

What is Morocco? It is the last ref-

uge of Mohammedan barbarism within sight of Europe. Somewhat smaller than Texas, with a population of about 5,000,000 souls, a foreign trade of some $30,000,000 a year, and a public debt of $50,000,000, its importance is out of all keeping with its size or wealth. There was a time when it was little less than the pioneer of Western civilization. Five hundred years ago the youth of Europe flocked to its shores to learn its sciences and marvel at its arts. Today it is in the grip of what is probably the most hideous medley of despotism and anarchy to be found anywhere on earth. Tax collecting is the one State industry. Nowhere perhaps is the art of extracting blood from a stone so near an exact science as in Morocco. With every fresh exaction there is a fresh crop of revolts. Perhaps not more than one-fifth of the territory is under real subjection to the Sultan. Over the distant tribes he has no more authority than had the English Government in the early years of the eighteenth century over the Highland clans. Harassed by rebellion and revolt, detested by his nominal subjects for a cruelty and rapacity that exceed even the generous license accorded to a Moorish Sultan, distrusted by the foreign residents for his inability to protect them against outrage, and met at every turn with demands from Europe for guarantees that he cannot furnish, punishments he dare not inflict, and safeguards it is out of his power to furnish, Mulai Abd-el-Hafid is on the whole the most helpless potentate in the world of today.

And five years ago there were actually people who thought and said that the Morocco problem had been settled by the Algeciras Conference. That Conference, as a matter of fact, left untouched all its essentials. It was summoned to reconcile the pretensions and interests of France and Germany. It was not summoned to lay down a firm and rational scheme for Moorish development. The Powers that took part in it overlooked the fact that, while the views and policies of Paris and Berlin were interesting and had a European importance, it was the Moors themselves who would ultimately insist on the largest voice in shaping the future of Morocco. But the Conference paid little heed to the opinions and representations of the Moorish delegates.

EL MEHADI LEADING HIS COMPANY TO FEZ

The distinguished diplomats who wrangled at Algeciras all assumed that the main function of Morocco was to provide the corpse for an international inquest. It was an assumption that other distinguished diplomats have more than once made in regard to Turkey; and there is the history of I know not how many European concerts to prove its fallaciousness. That Morocco would speedily avenge herself upon those who had forgotten or derided her hardly occurred to any one. Yet to pretend that the Moors would readily submit to the reforms agreed upon by the Powers was to pretend that they prefer peace and the dominion of the infidel to their native, traditional and self-contained anarchy. There never was any warrant in Moorish history for such a delusion. The Moor will trade with Christians, and allow them for commercial reasons to reside in his country, but he will resist to the last everything that tends to establish the abomination of a Christian overlordship. He needs the money and the money-making enterprises of Europe, but nothing else, and all Christian Powers are equally obnoxious to him when they urge him to depart from his ancient mode of life or thought, or are in league to fasten upon him the rule of the stranger and the unbeliever. The only European government that can win his favor is the government that will protect him from the rest; and he will exploit the diplomacy of such a government just so long as, and no longer than, it serves his purposes. Morocco is neither pro-German nor anti-French, except as the one attitude or the other may help her to preserve the fundamentals of Moorish civilization. Her settled policy, her instinctive passion, is to be anti-European, to maintain an unremitting independence, to fight with all the fury of Islamic pride and contempt against subjection to Christian control. This determination has been, if anything, rather hightened than modified by all that has happened since the Algeciras Conference—by the attacks upon the foreign settlement at Casablanca, by the overthrow of Abdul Aziz and the atrocities committed by his

SPANISH TROOPS ASLEEP AT ALKAZAR AFTER MARCHING FROM LARACHE

brother and successor, by the introduction of the international police at the forts, and by the total collapse of the governmental machinery and the armed intervention of France, Spain and Germany. In any discussion of projects of reform in Morocco, in any review of the Moorish question as a whole, the first thing to bear in mind is that the Moors hate nothing so much as the dominion of the Christian, that they are a turbulent people, confused by many rumors, deeply infected with lawlessness, and prone to frenzied outbursts of religious and racial fanaticism. Under civilized government Morocco might be made a prosperous and contented country. The potential wealth of grain, cotton, gold, copper, iron and lead is affirmed by every competent observer. Yet it remains in a drowsy, anarchical state of decrepitude, its soil untilled, its mines unworked, its people ground down, its means of internal communication still restricted to the horse and camel, a nation not so much dying as committing daily suicide, a perpetual Armenia blasted for the jealousies of the Powers.

One could fill a volume with details of the plots hatched in the chancellories of Europe to gain control of Morocco. It would not be a creditable tale, unless, perhaps, to the Moors, who have rebuffed every approach with a fierceness which the centuries have shown themselves powerless to move. On its international side the Moorish problem, like many other political problems, is mainly a matter of geography. Were Morocco anywhere but just where it is, there would be very little heard of any Morocco question. "Kick it out," as Nelson said, "into the Atlantic a hundred miles, and the sooner it is colonized by a civilized Power the better." Ten years ago practically its whole bearing on European politics lay in the few hundred miles of coast line between Tangier and the western frontier of Algeria. Even today, tho Morocco since then has acquired many other and more contentious points of contact with international rivalries, that part of its territory which faces Gibraltar and is nearest to Spain is of special importance. Gibraltar is only half the key to the entrance of the Mediterranean. The other half lies on the Moorish coast; and it was the struggle to gain possession of this other half that made up two-thirds of the Morocco question as recently as a decade ago. A first-class naval Power owning a harbor and fortress on the Moorish coast, nearly opposite Gibraltar and almost within gunshot of it, would be able to offset the British stronghold, would dispute channel on equal terms with the British navy, and would, in consequence, seriously jeopardize the security of Great Britain's hold over Egypt and the shortest route to India. Nelson declared the possession of a fort on the Moorish coast to be "a necessity" for England in any European war. That perhaps is putting it a little too strongly, but most people would agree that it is "a necessity" for England, and a vital one, to see that no first-class naval Power effects a lodgment in Morocco. This, then, is Great Britain's great strategic interest in Morocco—to keep the Straits clear and to prevent the possibility of another, even of a weaker, Gibraltar on the Moorish coast. Clear expression was given to this interest in the Anglo-French agreement of 1904—fortifications between Melilla and the hights dominating the right bank of the Sebu being specifically forbidden. But, besides this, Great Britain has a further stake in the question of Morocco, a commercial one. About half the external trade of the Shereefian Empire is in British hands, and it is therefore to Great Britain's interest to see that, whatever may be the political future of the country, her commerce is not discriminated against. In the Anglo-French agreement the "open door" and an equality of trading opportunities were guaranteed for thirty years, and provision was made for prolonging the arrangement for further periods of five years each. In addition to this strategic and commercial interest in Morocco, Great Britain has also a political interest. The essence of the Anglo-French agreement was to give France a free hand in Morocco and Great Britain a free hand in Egypt. The French Government stated that it had no intention of changing the political status of the Shereefian Empire. On the other hand, the British Government recognized the special interests of France in Morocco owing to the fact that French and Mo-

vacant territory marched together. France agreed to give the Moorish Government every help necessary for administrative, economic, financial and military reform, and Great Britain pledged her assistance to France in securing these objects. As Germany for the past six years has set herself to obstruct the purposes of the Anglo-French agreement, Great Britain and France have naturally been thrown closer together both in sentiment and in policy, and there are today few clearer examples of international good faith than the steadfastness with which the British Government and the British people have supported, and intend to keep on supporting, France thru all the difficulties of the Moroccan imbroglio.

As for France, the proximity of Algeria and the fact that for 800 miles the western frontier of Algeria is the eastern frontier of Morocco, give her a deep and tangible interest in the tranquillity of Morocco. It is an interest which in some ways transcends the combined political and commercial stake of all the other Powers in the future of the country. A disturbed Morocco means a restless and agitated Algeria, and the possibility of France finding herself at any moment with a holy war on her hands. Moreover, the French are naturally desirous of cementing Northwest Africa into a solid empire, stretching from Algeria to Senegal. Their easiest line of connection, the line that the railway of the future will follow, lies through territory that is claimed by the Moors; and it is safe to say that no solution of the Morocco problem would be satisfactory to France that did not bring this tract of land within her sphere of influence. Then, again, at Algeciras France claimed and received, by virtue of her special position, a mandate from the Powers for the protection of the persons and property of Europeans in the neighborhood of the eight open ports; and in the same way the joint Franco-German declaration of February 9, 1909, recognized that "The special political interests of France are closely bound up in that country with the consolidation of order and of internal peace." It is undoubtedly the hope and ambition, if not the actual policy, of the Third Republic to bring Morocco, peacefully if possible, under French control; and that hope and ambition have grown all the stronger and the more firmly fixt since Germany has apparently committed herself to defeating them.

Next to France the country most directly concerned in Morocco is unquestionably Spain. In the first place, she already owns four or five stations, among them Ceuta and Melilla, on the Moorish coast, opposite Gibraltar. Secondly, she claims as her own the territory along the Atlantic seaboard that interposes between Morocco and Senegal. Thirdly, the Spanish colony in Morocco is far more numerous than either the English or the French. Lastly, Spain is Morocco's nearest neighbor in Europe, regards the land of the Moors as a reversionary estate, and is deeply concerned in its fate for reasons of history and sentiment. Morocco touches the national emotions of Spain as Cuba and the Philippines never did; and no Spanish government could live a day which could be accused of apathy or negligence in maintaining Spanish interests in Morocco.

Germany's concern in the Shereefian Empire is mainly political and derivative rather than commercial and tangible. The Anglo-French and the Franco-Spanish Agreements of 1904 disposed of the future of Morocco as tho Germany had no interest in it. The Wilhelmstrasse was not consulted as to the terms of those conventions and was not officially informed of their nature and import. It was not because of any palpable damage to her commercial interests either present or prospective, but because England and France and Spain had taken it upon themselves to settle the Morocco question without consulting her, that Germany in 1905 was moved to a strong, sudden and effective protest. Every one remembers how the Kaiser visited Tangier to block the progress of French penetration; how an acute Franco-German crisis supervened; how an international conference was summoned at Algeciras to compose it, and how persistently the German press has followed every move of France in Morocco ever since with vigilant suspicion. The legitimacy of Germany's position in the Morocco entanglement cannot, I think, be successfully impugned even if her methods of enforcing it may justly be criti-

cised. No doubt the Wilhelmstrasse would like to possess a port and naval base on the Atlantic Coast, but as both England and the United States would find any such development highly inimical to their interests, it cannot and will not be realized. None the less it is useful for Germany to assert herself from time to time in Morocco affairs. It gives her a chance of testing the strength of the Anglo-French *entente* for one thing. For another it enables her to put a very severe pressure upon France without risk to herself. Morocco is the point where the French shoe pinches and the German calculation is that if only she treads heavily and persistently enough on that point, France will agree to "compensate" her in other directions—in the Near East for instance and in connection with the Bagdad railway. At all events a vigorous display of German interests in Morocco demonstrates once more the impossibility of leaving the Wilhelmstrasse out of the reckoning in any matter in which it declares itself to be interested, assures to Germany her "place in the sun," and enables her to remind France that friendship with England is but a poor protection against the effects of enmity with Germany. All this makes Morocco a center of exciting and tortuous diplomacy and as the Act of Algeciras, which was designed to buttress and improve the *status quo* in Morocco, has clearly broken down mainly because the *status quo* itself has collapsed. Europe is left face to face with a situation not indeed perilous but full of unpleasant possibilities. With France, Spain and Germany in armed occupation of portions of Moorish territory, the problem of Morocco may fairly be said to be entering on a new phase. If there were any chance of its proving a final phase, it would be some consolation. But finality and Morocco are now regarded by the statesmanship of Europe as mutual contradictions; and while nobody is seriously alarmed by the turn events have taken nobody professes to see its ultimate outcome.

LONDON, ENGLAND.

# The Live Conscience

BY HARRY KEMP

The Dead Man lay beneath the mold,
  But still his spirit knew
The soft stir of each blade of grass
  As toward the sun it grew;

He heard the far-flung church bells ring,
  He heard the lessons sound
Of children's voices, as they played
  Merry on April ground—
And he felt the little, red-tipped worm
  Go tossing round and round.

He felt the Winter rain drip down,
  It ached against his bones—
And his was not a plight where one
  Might ease oneself with groans.

For he had to be forever dumb
  There in the dreadful tomb
Till all the graves gaped open wide
  At the crashing Trump of Doom

Till interminable Time had flown
  And the universe grew gray
Ere the finger of Eternity
  Would touch his eyes with day.

He could not move, he could not weep,
  Nor might one finger strive
To lift itself,—he could not sleep
  For his Conscience kept alive.

His dreadful Conscience kept alive
  (Oblivion held no term)
And it preyed upon his pent voice
  Than Midnight or the Worm

Oh, if this be what men call "Death"
  I do not wish to die
Till the sun goes out like an unfilled lamp,
  And God folds up the sky!

LONGMAN, LEE.

A WATERFALL IN HARRIMAN PARK

A turn in the road brings one upon a waterfall, splashing its spray in the sun

# The Opening of Harriman Park

BY E. STAGG WHITIN, Ph.D.

[The park here described by the chairman of the Parks and Playgrounds Committee of the Municipal Art Society of New York preserves for the people forever a beautiful stretch of country along the Hudson River. It is a benefaction that will greatly increase in value and usefulness as the years go on.—EDITOR.]

THE sun setting over the Ramapos shone full upon two figures—one a youth, the other a man of mature years—standing out on a platform raised upon the Bear Mountain plateau for the occasion. The long swing of the winding Hudson, a mile below, with Anthony's Nose abutting gave background to the drama. "In the name of my mother . . ." the young man was saying amid the shriek of the boats on the river; "In the name of the State . . ." the elder was responding, as a small packet passed from one to the other. . . . "by this act you have conveyed a fortune and a domain." The cannon boomed and the flags of two States floated in the breeze, symbolic of the fact that the States of New York and New Jersey were the richer for this simple act of a modest, retiring boy, who at the behest of his mother had presented the new state park and thus consummated the long cherished plan of his late father, E. H. Harriman. When Mr. Harriman was asked some years before his death what he intended to do with his wealth, he laughingly asked the question, "Which do you think the public would like best, libraries or parks?" Last September Averell Harriman made answer by this deed and George W. Perkins in receiving the gift, as chairman of the Palisade Park Commission, answered for the public that they liked it well—so well, in fact, that from public donation and legislative grant $3,000,000 more was freely to be added for extension and maintenance.

The plateau of Bear Mountain, where this "christening" was held, gives a fitting introduction to any appreciation of the beauties of the Harriman Park. The view from this height, surpassing as it does the far-famed one from old West Point, extends from the Storm King to Haverstraw and over to the Connecticut hills. Up the steep incline from the river winds a fine carriage road, and when plans mature a formal entrance for pedestrians, with fountains, rustic seats and cosy resting places, will join the plateau with the boat landing on the river. Here the day boats will stop in that not far distant day when the plateau will be covered with its tent city, a breathing spot for the many from the great city. Close by the mountain and the plateau nestles Lake Surprise, splashing its clear waters far above the river and recalling to the historically wise the Hessian troop who in Revolutionary days tinged the waters with their blood. It took a Byron to picture the Rhine so that the imagination of the people was touched—no prose will do justice to the natural grandeur of this Hudson panorama, which surpasses far the castled Rhine.

Not alone from this Bear Mountain plateau, but also from many points on the roads that lead back thru the park do you catch those superb views of the winding river, across the low marshes with the hills beyond. These same roads turn in land and wend their way toward Arden—eight miles across the wooded hills and grassy valleys. In the spring these valleys are white with blossoms and the hills a mass of shaded foliage. Numerous brooks and streams gurgle among the bushes. A turn in the road brings one upon a waterfall, splashing its spray in the sun. The woods are still wild—squirrels, song birds and some game are common, and a proper system of protection and preservation of the native wild life, once introduced in the park, would fill it again with larger birds and game, such as deer, woodcock and partridge.

Some forestry work has already been done in the neighborhood of the roads. Mr. Harriman was the first to undertake

A VIEW FROM THE UPLANDS
The lover of nature finds the same large variety of silva, fauna and flora as is common to the Appalachian Range in general

the proper care of forest lands under Mr. Pinchot's system, and the continuation of this work seems assured. Plans are being arranged to allow the Yale School of Forestry to make experiments this summer in this direction, which will be of mutual benefit to the school and the park forest. Road building is much needed in the park today, tho some stretches are the finest in Orange County; this is true of the road from Southfield to Arden, which is level, well drained, and ditched and has stood the test of all seasons, necessitating little repair, and is a sample of what the roads thru the park should be made and how they should be kept.

Besides the streams picture lakes are numerous, and more can be formed artificially with little expense to the State. About these a very wonderland may be developed, both for the simple camper and for the luxurious motorist. Walking parties are even today common among these Ramapo hills, and the lover of nature, be he naturalist or not, finds as in a tangled garden the same large variety of silva, fauna and flora as is common to the Appalachian Range in general. The frequency of hemlock and pines keeps the park green even in winter, when the rugged hills shake off the snow and frown down upon the wayfarer on the roads.

The pilgrim to the park from New York City must either take the Erie to Southfield or Arden and then go east, or try it by the West Shore Railroad to Haverstraw or Fort Montgomery. By motor from the city the well-beaten track to Haverstraw or Tuxedo will make possible a thirty-mile turn about the park.

Visitors to the park this summer will probably be confused as to where the park really is, especially if inquiry of the farmer who happens to reside in the central portion of the park area brings the response, "This ain't no park; I own it." It is therefore essential to bear in mind that the Palisade Park

Commission today possesses the power to condemn and the money to pay for most of the land lying between Arden and the river and from Haverstraw to Newburgh. The commission so far has only come into the possession of the land given outright by Mrs. Harriman or ceded by the Prison Commission. The rest is to be secured by purchase or legal process. Such processes are slow indeed, still thankful must we be that a beginning has been made, and that, under the successful developments planned by the Palisade Park Commission, its natural beauties will become more and more accessible to all the denizens of the great city. Those new custodians of the park have a large and arduous task and little suggestive precedent to follow, unless it be that they will guide their work by the spirit which animated the gift which made this park possible. The motive, phrased by one who knew Mr. Harriman maybe better than he knew himself, was the desire "to live and to let live—to develop and make better, to share and to improve and to add to the pleasure of others."

It may seem that little more than these gifts have been consummated; still, even in this consummation there is a very profound significance. The movement for the conservation of national resources was conceived as the retention by the people of their few remaining possessions. By this gift has been returned to the public domain lands where even by the Indian deeds it is proved that private possession was recognized before the white man discovered this country; still, the significance is broader yet should we stop but a minute to consider it. In England great estates have been left to the Crown; in this case the heir is the Sovereign People. The burden of wealth may bear but lightly where there is so worthy an heir and so deserving an issue.

PICTURE LAND IN HARRIMAN PARK

# Some Phases of the Modern Japanese Literature

BY YONE NOGUCHI

[illegible]

THE China Japan war came too early to inspire our Japanese literature to make any decided turn; the latter was yet in its teens. (You must know that Dr. Tsubouchi's "Types of Students" of Meiji 18th, 1885, was the first new novel in the modern meaning, the dawning light of the present Japanese literature.) As the China-Japan war was an inevitable or necessary thing politically for Japan, it did some service for our literature, however, upon which I reflect with a sense of gratitude. The tiresome repetition of Rohan Koda's idealism, and of the late Koyo Ozaki's vaguely called idealism, which benefited and at the same time troubled themselves under the reminiscence of the literature of the Tokugawa feudal age, came then to a sudden stop, to be replaced by the temporary war literature. The war, however, a small affair in comparison with the next war that we fought with Russia, none the less vivified the nation; there is nothing like war to clear the national consciousness and to develop the sense of responsibility. The writers and novelists, whom the country had treated hitherto as if they were a sort of black sheep, in a measure vindicated themselves, most suddenly becoming the important factors or moving spirits of the nation. The circulation of papers and books doubled and trebled; it was the time for those who made their livelihood by writing. Large magazines like the Taiyo, Sinshosetsu, Bungeikurabu and others, which prosperously exist today, were then started, and the field of action for writers was enlarged. It is from the time of the China-Japan war that the reading habit or interest became rooted and the real approach of literature and the people was thought not impossible; and that is not a small thing at all.

The war was over, peace returned; and the literature, too, came back to its former place in spite of itself, disappointing the critics who prophesied the dawn of a new literature. Literature must create its own salvation with a creative impulse and inner force, and it is clear that material help alone cannot make it start toward a new advance. However, Koyo Ozaki's superficial realism had already reached a point where it must make some turn. As I said, it was superficial because its observation did not enter into Life's meaning, and fancy and imagination were exprest only thru the seeming realism. When the Conception Novels, or Kwannen Shosetsu, as we called them, began to be talked about, it seemed that our realism had taken one forward step. The Kwannen Shosetsu aimed at presenting some sort of conception of life, as the name indicates; however, it is not the same with Rohan Koda's idealism, which was abstract and visionary, and evolved from his ancient view of morality and belief. The former was more individual, founded on matter of fact. If our realism had been the real realism in the modern meaning, it might not have found a meeting point with such a school; but it grew somewhat deeper with its help. The late Bizan Kawakami; Kyoka Izumi, who, however, soon gave it up for a school of his own establishment, that of a fantastic ghostliness; Ryuro Hirotsu, who used his own psychology objectively and told more of the darker side of human life, especially in his "Imado Shinju"; Chikusho Bara and others, are the well-known names that were active under a rough classification of Conception Novelists. Koyo Ozaki, who appeared at once to be exhausted in his belief and unable to make any new attempt, came out with his memorial works, "Tajo Takon," or "Much Passion and Much Enmity," in

1886; "Konjiki Yasha," or "The Gold Demon," in 1887, which were no small ornaments to the literature of the period of Japan's youth, which actually came to a close some ten or a dozen years ago. In those works Mr. Ozaki fully proved that his realism could acquit itself very well of the charge of superficiality; and he died after reaping a great fame, which he had won already in his early age, but which afterward reached the highest mark. "Konjiki Yasha" is the story of a struggle between love and money; it was dramatic enough to become popular. And the psychological delineation escaped nakedness thru the most beautiful writing. We can say we saw that the real office of a novelist was to present the real picture of life, and the day of estheticism was doomed. The new literature which was promised at the time of the China-Japan war could not get into shape; but our literature of novels advanced from the realistic to the psychological. It was five or six years after the war that we began to make the real approach to life and nature, or their true understanding, most important.

It might be not far wrong to say that new Japan and also the Russia-Japan war were the creation of the Western countries. And again I say that our new literature and "naturalism" that swept and are still sweeping over Japan are nothing but the Western creation; what an influence and mystery the Western literature worked! We began to fight with Russia when we had reached manhood not only as a nation, but also in our literature. Our loss of dream and ideal was hastened by the big war we engaged in; we spilled a tremendous amount of blood, countless numbers of human lives disappeared as morning dews, and we soon went under the almost unbearable national debts, the saddest side of which became visible immediately. The cost of living almost doubled after the war; and our morality and old belief were sadly disturbed under the most untrustworthy prosperity, a mirage that was bound to disappear, which temporarily existed from the so-called great war success. The financial crisis produced many suicides, and the sad destiny of being a poor country was printed on each mind. What gain had we from the war? we asked. The glorious side which shone at the beginning of the war was now replaced by the reverse; the country and life appeared at once to be a tragedy itself. We became pessimists; at least we felt a deeper interest in the seamy side of humanity.

The war was not only a war of the Far East; there was no time before in fact when we could approach the Western minds as in the war time. Tokyo appeared in spirit not to be in the Orient but somewhere in Europe; London, St. Petersburg, Berlin and others were her neighboring cities within arm's reach. It was a strange phenomenon that the Japanese writers and literary men burned incense and knelt in devotion right before Turgenieff, Tolstoi, Gorky and others, while on the other hand the country was cursing Russia and calling her the most barbarous of countries. I think there was no other writer like Gorky whose work made such a strong impression; and so many of them have been translated since the war. Turgenieff and Tolstoi were already known in Japan in early 1887; but the study of their books started anew with the war. The novelist, Roka Tokutomi, made a special pilgrimage to see the author of "The Cossacks" and "The Resurrection" in his Russian home. It is true that the war brought nearly all the works of modern European writers which were worth reading. Translations of Ibsen began to appear; in poetry, the works of Verlaine and Mallarmé were discussed. In the drama, Maeterlinck's "Monna Vanna" was put before the Japanese audience. What did they teach us? We heard the gospel of individualism in the wider meaning, of course; and the pictures they spread before us were nothing but the tragic side of humanity. And we saw in real Japanese life during the war or after the war what we read in their works.

The Government authorities had been trying for some years now to suppress the circulation of many of their works under the rough category of unclean literature; in fact, there is no Japanese writer among the so-called naturalist school whose work did not stir their anger sometimes. We have no precedent in our literary annals that the writers

and the Government presented such an opposite front. When the former called the latter an incurable ignoramus who attempted to judge their work with the old measure, which completely failed to meet the spirit of the age, and declared that the old morality was a superstition bred under a feudal time, and apt to do more harm than good, the latter was ready to cry that the former were hopeless degenerates, who voluntarily descended to the place of animals, and that their lack of aspiration was really sad. I have many reasons for saying that both parties have somehow gone astray from the right path; they must find a point where they can compromise. I wonder why naturalism should oppose morality; and I think that the true idealism has no cause to fight with the reality which is beautiful. It is sad to see lately one thing or another suppressed by the authorities; if we take the Government side, this is truly the darkest age of literature, when the writers think it glorious to break with morality. And taking the other side, we can say that it is almost tragic to have authorities so uneducated in literary matters that it is hopeless for them to attempt to understand the modern current of literature, which is ten thousand miles ahead of the official recognition of it. I do not go into detail. Suffice it to say that we are not in a healthy literary condition. I dare say, however, the Government is often fantastic, as she suppressed the translation of some of Zola's and Molière's works, while the books in the original are sold in broad daylight.

I am suspicious of the Japanese writer's morality, as I have many proofs that they were frequently imprisoned already under the Tokugawa feudal régime on account of obscenity. It is now more than forty years since the English language was first introduced in Japan; I admit that the English books had a great influence politically as well as socially. Evidently some Japanese journalism and journalists show their influence; but what a slight influence we received from them in pure literature! Nearly all the higher schools have a course in English literature; and it is not too much to say that every school in Japan teaches English. Thackeray, Tennyson, Meredith and others are on any educated Japanese tongue; but how much do they know of them? As the other European languages are less known than English, the latter served for them to be the interpreter of the Continental literature; thrû the English medium they approached it. And when the service is done, the English is usually forgotten. Is it because our temperament and social conditions are more akin with those of the Continental countries? However, I think that nothing but the English saves our literature from corruption.

It was soon after the China-Japan war that the writers showed much interest in the darker side of life, and tried to expose the real humanity at the sacrifice of idealism and beauty; Roan Uchida, an interpreter of the Russian literature, almost started a school of social novels, which, however, was not powerful enough to overthrow Koyo Ozaki and his followers' art for art's sake. Tengai Kosugi, who professed to be a disciple of Zola, only gained some popularity, which even in Japan does not mean anything at all. With Koyo's death, his school came to a close; his followers, Fuyo Oguri, Shusei Tokuda, Shunyo Yanagawa and others, were obliged to change their attitude and color their tone with the sudden rise of naturalism. The late Doppo Kunikida was the forerunner of this new school in Japan, and Katai Tayama the leader in fact. Toson Shimazaki, originally a successful poet, came to the front with his memorable novels, "Hakai" and "Spring." Hakucho Masamune, Seika Mayama and Kaoru Osanai are the three most promising young writers who have done already some strong work. It is said Mr. Tayama realized his theory and thought in his story of "Life," and more in his later work called "Wife." Indeed, I admit that the dignity of genius has fallen flat, and may be a piece of superstition, as some one says. It may be also one way to reach a true salvation to expose real life and human darkness; but the question is, Can we really reach it by that road? I am told that the naturalism of the Continent was a failure; and I am assured, however, by the Japanese writers, that it is the only literature. Let time show.

KAMAKURA, JAPAN.

ST. MARY'S HOSPITAL
In this building the operations that have made Rochester famous are performed

# A Medical Pilgrimage Westward

BY JAMES J. WALSH, M.D., Ph.D., Litt.D.

[The following article is about the Mayo Brothers, perhaps the two greatest American surgeons. Dr. Walsh especially undertook a trip to Rochester, Minn., to get this article for THE CHAUTAUQUAN which we are sure will interest all our readers.—EDITOR.]

FROM the earliest times medical pilgrimages have been the rule. Those who wanted to learn more about medicine than was possible at home traveled, usually with some definite place as their objective point. Always this point has been eastward. In modern times our first great medical pilgrim was Constantine Africanus, who traveled in the Near East and then taught and wrote at Salerno. After his time Salerno and many other cities in Italy became the sites of medical pilgrimages. Gradually the course of empire and of culture and of scientific training took its way westward. Always however, the westerly peoples went eastward for a touch with what was most advanced and progressive in science. Our American physicians have gone to Europe. It is an anomaly, then, to talk of a medical pilgrimage westward. At the present time, however, there is a pilgrimage place well to the west that is probably attracting more attention from at least English-speaking physicians and surgeons than any other. Usually medical pilgrimages have been made to large towns. This, however, is a small Western town, yet it has been the attraction for a great many prominent members of the medical profession in this country during the last few years.

The story of how it came to occupy this unusual position is rather interesting. Just twenty years ago a cyclone struck the little town of Rochester, Minn., at that time containing probably less than 5,000 inhabitants. More than two score people were killed and a large number were injured. There was no hospital in the town, so that the injured, of whom there were a great many, had to be housed in various public buildings, to be cared for by the devotion of the charitably inclined. Many of the injured children were taken into the Mead

[Illegible] of the Franciscan Sisters, founded only a few years before. The Sisters volunteered as nurses in certain of the public buildings where the injured were being cared for. When Rochester recovered from the cyclone it was realized that a hospital was needed, and St. Mary's Hospital, in charge of the Franciscan Sisters, was founded the following year, and its twentieth annual report is the last published.

Founded under these circumstances, it might be expected that this little hospital of a little Northwestern town, away out in Minnesota, would be just doing the work of an ordinary country hospital. We have thousands of such institutions in this country, that while doing their work very acceptably, are of absolutely no interest to any except townspeople and to some medical statisticians. St. Mary's is different, however. At the end of a scant twenty years of existence there is scarcely a physician in this country who does not know of it. Certainly no physician who pays any serious attention to medical literature can fail to know a good deal about it. All those who are watching the progress of surgery closely in this country and who are interested in pathology, are sure to know much about it. Not to know it is literally to argue one's self unknowing in important details of present day medicine and surgery, if not also absolutely unknown in the medical profession.

The story that I have to tell, then, is how this little hospital in a little Western town has grown to be a very center of attraction, has enlarged and again enlarged its facilities until now it can accommodate 200 patients, and these patients come from all over the country. Besides patients, it has a constant attendance of a score or more of visiting physicians, representing during a single year probably all the States of the Union and some foreign countries, who have come to see for themselves the work that is being done and study how such good results are being obtained.

If there is anything in the world that would make it very clear that it is as true now as ever it was, that men and not institutions help us to real progress and accomplishment, this little hospital at Rochester is the proof. In recent years we have come to think that we have changed all that, and that the organization of great institutions must be looked to as the source of scientific progress. One has a chance to think a second time about that proposition, however, with Rochester, Minn., before one.

The history of this little hospital at Rochester is worth while tracing. At first it was placed in charge of a country practitioner who did all sorts of medical work and did it very well, considering the circumstances. He was past seventy when he took up this work, and old Dr. Mayo is still alive at the age of ninety-two. His two boys, raised on the farm —there are some great things raised on farms besides the ordinary farm products—got an introduction to medicine in their father's office and then went off to medical schools. Dr. Will, the older, graduated at the University of Michigan, and Dr. Charlie (none of the townspeople call them by any but these names yet, and patients and their friends are not in town more than three days before they take up the habit) went to the Medical School of Northwestern University, Illinois. They came back to Rochester, settled down apparently to the demanding medical practice of a town of about 5,000 inhabitants, with the prospect of long night riding into the surrounding country, and work of all kinds for just the struggling existence and respectable but not luxurious rewards that a busy, faithful practitioner of medicine in a small town is likely to secure. Within that same decade of the eighties there were probably some 25,000 young physicians settling down under just the same conditions and their future has not belied that prospect. The Mayo boys were different, however, and very soon that difference made itself felt. It was not that they were so brilliant, but they were ambitious in the right way, eager to learn and able to take and make chances to learn, solid, faithful workers, and one of them at least possessed a genius for organization.

In many parts of the country, in New York at both the post-graduate schools, in Philadelphia, in Chicago—wherever,

indeed, there was a good opportunity to secure special training and see good work—one or other of the Mayos would turn up occasionally. They were not forward and usually attracted little attention. Professors of surgery in many parts of the country soon began to recognize that a quiet man on a rear bench who was paying so much attention was a physician from Minnesota named Mayo. After a while they knew him as one of the Mayo brothers. Often he asked a telling question, tho they were few in number. Always he got at the heart of a subject and evidently took it away with him. The other brother was at home doing the work of both while this one was away getting points. They took turns at it. Then these young men began to turn up at medical society meetings, reading papers which showed that while they were doing ordinary surgical work, they were doing it with extraordinarily good judgment, with fine technique, with perfect aseptic precautions and with striking success. They were studying their cases carefully beforehand, they were planning their operations thoroly, they knew the last thing that was being done in any line in this country or in Europe, for after a while their excursions in search of what was best in surgery and diagnosis, it was noted, took them over there, and they were applying the lessons they had learned with what was little short of marvelous skill.

By the time they had been at work for ten years their names had become familiar to every one doing serious surgical work in America, and it gradually became the custom for a certain number of younger ambitious surgeons at least to take their vacations in Rochester and see the Mayos do their work. Those vacations were schools in both the Latin and Greek sense of these terms. In Greek school means leisure for mental work, and in Latin *vacare rei* means to be free to apply one's self to something so that one really gets everything there is in a thing out of it. Before long the older surgeons were making occasional pilgrimages to Rochester, Minn., because, even if as they probably would have said, principles might not be learned there, a magnificent hospital organization could be studied and a faultless surgical technique followed with pleasure. Then, when foreign visitors came to America they wanted to get to Rochester. Even Germans went; the English went, of course; the Japanese wanted to see the simple, efficient, thoro organization which had rendered such good work possible in a little hospital in a small town. There is the story of the Mayos in a few words. It is no wonder that patients have come to them not only from all the surrounding country of the Northwest, but from probably all the States of the Union.

The 200 beds in the hospital are kept constantly full, and as patients are moved out to convalescent hotels just as soon as their condition will allow it, an average of about fifteen serious operations a day are done. It is no wonder, then, that one of the trains that comes in from the West to Rochester is called "the hospital train," because so many seriously ailing patients travel by it. The Chicago & Northwestern has put on a special Pullman car that runs nightly to and fro from Chicago to Rochester to accommodate the patients who want to get to the hospital. It is not often in this country that a railroad finds it worth while to run a nightly Pullman to and from a town of 8,000 inhabitants. The moment you board this car at Chicago, however, you are likely to know that there is a hospital at the end of the route. One or two patients will probably be sufferers from goitre, one or two will have a jaundiced look, for operations upon the gallbladder and the thyreoid gland are specialties at Rochester. Some of the other patients will be, even to the unpractised eye, manifest sufferers from nutritional disturbances consequent upon digestive diseases, for operations upon the stomach and intestines are the other favorites at the Rochester hospital.

After one has had a good look around at Rochester, has seen the hospital crowded in spite of its 200 patients, with its daily average of at least fifteen serious operations a day, has had a view close up of the crowded offices downtown, where some 25,000 patients apply for treatment every year, has realized the cosmopolitan character of this crowd

of patients from the farmer from the surrounding country and the Northwest who is in the majority because he lives so near by, to the better dressed classes, who have evidently come from long distances, appreciating besides that there are many physicians from all over the country and wealthy patients who are seen in private, it is easy to understand the appropriateness of the quotation from Emerson in illuminated print which some grateful patient has sent and which hangs just above the desk in many ways ideal. While there is not a hint of what is ordinarily called charity about the work, and patients are charged good fees, the wealthier among them indeed what might be called even large fees, there is a feeling of the most intimate dependence on physicians exhibited by patients. Poor or rich, they are all examined thoroly, their cases carefully studied, their conditions elucidated just as far as possible, and the suggestions as to the treatment necessary made. While handsome fees are

THE OPERATING ROOM
Visiting physicians stand behind the railing at the left of the picture

of one of the Doctors Mayo: "Have something that the world wants—and tho you dwell in the midst of a forest it will make a pathway to your door." Literally the world of America and even the wider world of Europe and of those parts of Asia that have been most influenced by European culture has made a pathway to the door of the hospital of this little town of the Northwest, where an organized body of medical men has shown them something that the world wants.

The relations between patients and their medical and surgical attendants are collected from the rich, no one is turned away because of poverty, and there is the feeling all over the place that the one dominant idea of the benefit of ailing humanity, much more than any selfish or personal reasons, has brought about the organization of helps for the ailing so efficiently here.

Probably the most interesting feature of the hospital and the work done there is the quiet peacefulness with which it is all accomplished. I have seen as many as twenty patients anæsthetized for serious operations in a single morning. It is very rare that so many patients can

be brought deeply under the influence of an anæsthetic without some of them at least making considerable fuss. Tho patients were never anæsthetized until just the proper moment, so as to have them ready for the surgeon, yet not allow them to be under the influence of the anæsthetic any longer than necessary, there was never a sound. It is easy to understand this happening sometimes, but to have that peacefulness the ordinary course of events is a very striking tribute to the thoro method and excellent organization of the details. Of course, it means that a skilled anæsthetist does the work, or, rather, a group of them—they are all young women—and too much cannot be said for this feature. But even with the most skilled anæsthetist, only that patients are thoroly confident, without an afterthought of fear and with the most positive assurance that the best possible is to be done for them, there would surely be some disturbing outcries occasionally.

This spirit of peacefulness invades the whole institution. The hospital in the evening, with probably 100 patients in it who have been operated on within the last week, who are therefore all of them in more or less acute stages of wound healing, so that sleep is difficult, wounds are fresh or have been recently dressed, seems more like a convent than a crowded, busy hospital for acute surgical cases. Everything is quiet and orderly, there is no noise, moans of patients are not heard. It becomes a matter of surprise how everything can be so peaceful under the difficult conditions. It is the confidence of the patients and then the routine of the place affecting them. The complaints of other patients do not get on their nerves to make their own difficulties harder to bear. It seems as tho one were violating a stern rule of the place to give way to manifestations of suffering. As a consequence patients control themselves. They learn to think of others as well as themselves. From this standpoint the conditions that have been developed by the organization of detail at St. Mary's is one of the most interesting contributions to the place that psychotherapy has even in serious surgical disorders that could possibly be thought of. In patients who are thus peaceful, all the processes of healing and of nutrition go on better than they would under more disturbing circumstances, and the consequence is not only a less eventful convalescence, but a much shorter process of recovery than is possible as a rule elsewhere.

This feeling of peace and confidence is not only in the patients, but in their friends. Most people who have a serious operation done—and remember that most of the operations done at Rochester are what are known in medical terms as capital operations—have two or three friends with them. Any one who knows how anxious and solicitous intimate friends are when those nearest and dearest are submitted to capital operations is surprised to find how happy and almost unconcerned are these friends when met in the hotels or other circumstances in Rochester, even just before and after their friends are being operated on. It is not that they are indifferent, and the town itself presents very few distractions for them, but the atmosphere of the place conduces to this calm way of looking at things, and in spite of the serious operations performed the mortality is so low that almost nothing happens to disturb the serenity even of those who are most interested. Rochester for this reason presents a most interesting field for observation in the psychology of that restfulness which is so much needed in many phases of American life.

It is rather interesting in the light of how much has been said about Rochester to realize exactly what is being done there. It is not something different from the surgery of today generally that is being accomplished at St. Mary's Hospital. It is only our present day surgery, done with such care and attention to detail, with such nicety of precision as regards the observance of aseptic precautions, and such skillful technique that the best possible results are being obtained. It is not what is being done that is different, but it is the method of the doing that has been refined to the last degree. There is no pretense of doing work on different principles or by different means from those which every surgeon has in hand and applies in good

work. It is only that the technique of doing it has been carefully worked out, no loophole for failure left as far as that is humanly possible, and as a consequence excellent results better, very probably, than those which are obtained anywhere else in the country—form the basis of the statistics of this little hospital, which has attracted so much attention from professional men.

The Mayos themselves are extremely modest about their work and make no exaggerated claims for originality. It would be quite impossible for them to have done as good work as they have, especially with the training and experience that they possess, with points gathered from all over the world, not to have devised certain ways of doing things that are original. They mention these, but pass over them lightly enough, and a visiting physician is likely to hear many more claims to originality made at almost any surgical clinic than at Rochester. During the course of an operation Dr. William Mayo said, when applying a suture in a particular way, "This is the Hippocrates-Mayo suture." It was his laughing way of making a claim for priority in the use of a particular kind of suture, but suggesting that probably somebody would find that it had been originally employed by Hippocrates or even earlier. Squabbles over priority of medical inventions are so common, and usually so trifling, and often with regard to things that were discovered long before and forgotten, that this attitude is refreshing.

While they are doing such excellent practical work with a surgical technique that is the admiration of every one who comes to see them, they are accomplishing some fine scientific medical work and contributing valuable additions to our knowledge in many complex problems. Perhaps in nothing has their work meant more in this regard than in all that concerns the affections that used to be grouped promiscuously under the title indigestion or dyspepsia. How many people there are who have suffered torture of all kinds from indigestion. Sometimes for special reasons it was called biliousness. Many a patient otherwise in good health has been known to suffer almost continuously from stomach symptoms, or to have repeated attacks that made life miserable. As a consequence most people who developed any symptoms of stomach disturbance were likely to set before themselves some of these worst cases that masqueraded under the term indigestion, and conclude that it was only a question of time until they too would suffer severely and perhaps hopelessly with chronic indigestion. Many a nervous person whose digestive symptoms were comparatively mild has borrowed serious trouble in this way, and by a limitation of diet further added to his digestive disturbances.

The work at Rochester is making the medical profession understand better all the varied forms of ailments that are, or at least have been, rather heedlessly grouped under the so-called dyspepsias and indigestions. A certain number of cases are due to old stomach ulcers. A certain number more are due to disease of the gall bladder and gall ducts, and represent the real biliousness, tho this term has been sadly abused to cover many and various forms of digestive disturbance. Then, as they have made very clear at Rochester, a number of cases of serious digestive disturbance in recurring attacks, apparently gastric in origin, are due to chronic appendicitis. Their study of these different forms, the contributions they have made to the differentiation of one from the other, and their recognition of the forms of indigestion consequent upon pulmonary tuberculosis, tuberculous ulcers of the ilium and cecum, and of the digestive symptoms so often seen in connection with pernicious anemia, have all been of very great value. Above all, they have enabled us to get away from that pretense of knowledge included under such a word as indigestion or dyspepsia, which covered real ignorance, and unfortunately, by supplying a ready name for an ailment, discouraged further study.

There are other phases of the scientific work at Rochester that would appeal to the general public as less practical and apparently less valuable, but that attract professional attention because they mean much for advance along scientific lines. Take, for exam-

ple, the problem of hypernephromata. These tumors are comparatively rare, but are thus far inevitably fatal. The symptoms are due to the development of a tumor often affecting the kidney and at first supposed to be due to aberrant kidney developments. Further study seemed to show that they were due to the inclusion within the kidney of particles of embryonic tissue originally meant to form portions of the suprarenal or hypernephron bodies. The excellent work of Dr. Wilson, the pathologist and director of laboratories at St. after a thoro review of the embryology of the kidneys. For this purpose Dr. Wilson has restudied the formation of the kidney in several animals and has reviewed the whole subject of the comparative anatomy and embryology of the kidney. Besides, he has taken the opportunity to restudy all the stored sections of small human embryos that are so preciously preserved in many laboratories thruout the country, and thus has been able to recall attention to an important subject. So far as we can see at the present moment, all this study

THE KAHLER HOTEL

Mary's Hospital in connection with the cases operated upon by the Mayos seems suggestive of a third explanation. These tumors originate neither in kidney nor in suprarenal substance, but in embryonic portions of the original kidney substance, the mesonephron, which never developed to the full extent of nephric tissue, but which retained in them wonderful embryonic powers of growth that may prove harmful under special stimuli later in life.

This explanation has only been reached after a careful study of many specimens of hypernephromata, but also

will mean nothing in the immediate future for the saving of life or even the sparing of human suffering. Probably it will mean nothing more for humanity until further developments of medicine, than would the discovery of a new planet. This work represents science of a high order, however, and it is from work of this kind, pursued with an eye single to truth and to scientific progress for its own sake, that we owe the great developments in medical science. That the Mayos should provide the opportunity and give the incentive, as well as support financially such work, is of it

ed the best tribute to their thoro scientific aims.

There are other phases of more or less abstruse science that have been discussed in papers published by the Mayos themselves and their colleagues of St. Mary's Hospital. The question of the parathyreoid glands, for instance, and their place in human physiology, has been touched upon in connection with the surgery of these organs, the various anomalies of the kidney, and the relation of certain kidney symptoms to anomalous blood vessels and to exceptional conditions in the neighborhood of the kidney, have been particularly studied.

While so much is made of the surgery at St. Mary's, Rochester, it must not be thought that medicine lags behind. The value of diagnosis accurate, thoro, complete, as the cornerstone of any development of surgery, is the first principle of the work here. As a consequence of this, some of the papers on diagnosis from the physicians of St. Mary's have proved very valuable contributions to our American medical literature. Any one who has seen Dr. Graham at work will recognize a master of careful, accurate diagnosis. Of course, he has the advantage of every modern aid. Careful blood counts are made, x ray photographs are taken, test meals are examined, detailed urinary examinations are submitted. To none of these laboratory aids of diagnosis is an exaggerated value given, tho the place of the laboratory has been only too often overvalued in recent years. It is the whole picture that serves as the basis for diagnosis. Dr. Graham's review of the value of the test meal in a recent paper is perhaps the best possible testimony to his failure to run after fads. To the medical men on the staff of St. Mary's we owe some of the best contributions to our knowledge of the real significance of indigestion in its many phases that have been made in America.

Most people would be quite sure that this work being done at Rochester is a striking exception to the general rule of accomplishment in science, and that good scientific work of a progressive character is almost never done in small towns. Over and over again, however, in Europe, men have done fine scientific work in smaller cities. Indeed, it is almost a rule, and it is certainly a custom, that the universities in the larger cities do not draw their professors directly from their own staff, but from the staffs of universities in provincial cities and towns. A young man cannot expect, merely because he is an assistant at Berlin, or Vienna, or Munich, that he will have any chance to occupy his chief's position a little bit later by waiting and working for it from the large city. He may if he is a rare genius, but the exception proves the rule. From his assistancy at Berlin, Munich or Vienna his next step is to a professorship in a smaller town. Then often to a professorship in a larger town, and ultimately, if he succeeds in doing good work, to the professorship in one of the large cities. Many a man in Europe, quite apart from any institution, has laid the foundation of a great career. Even Koch was only a general practitioner of medicine in a small town in Germany when he made his first important discoveries, which revealed the man that he was.

In this country the rule in the past has been that our best medical and surgical talent came from the smaller cities and was gradually drafted into the larger cities because of the rewards offered for their work. Apparently institutions cannot make great teachers. They may find them. The teacher and the investigator is born, not made. Any routine by which he is supposed to be inevitably obtained as the result of a definite course of training is sure to fail. Above all, there is no inheritance of these nor of the teaching faculty nor of the investigating spirit. If we were to consult recent history, a good reason for not placing a man in a teaching position would be because his father had been a successful teacher, for nine out of every ten of teachers' sons prove not to be teachers themselves. Apparently one might as well expect a poet's son to be a poet, or a musician's son to be a musician.

The work of the Mayos, then, has taught us a number of special lessons that we needed just at the present moment in America. It taught the young

man that he need not go to the large city to get the opportunity for large work if he has it in him to make it. Complaint of lack of opportunity usually means lack of initiative and energy. It has emphasized at a time when we needed it very much the fact that it is men, and not institutions, that do things. It recalled attention to an important phase of medical history, that our best university medical teachers have been in the past recruited from the country and from small towns, and we are making a serious error in thinking that we had changed all this in recent years. It has also shown that in spite of many declarations to the contrary, real merit still succeeds in finding recognition, and with that recognition comes appropriate reward.

NEW YORK CITY.

# Biblical Ignorance of College Students

BY THOMAS ERNEST RANKIN

ASSISTANT PROFESSOR OF RHETORIC IN THE UNIVERSITY OF MICHIGAN.

THE need for elementary instruction in the contents of the Bible is nowhere more clearly seen, nor, I believe, more keenly felt, than in classes in English in the State universities. The list of seventeen questions, with some subdivisions, given in the answered questionnaire below, were presented to a class of seventy-eight students in rhetoric in the University of Michigan. Of these students, one was a member of the graduate school, four were seniors, eight were juniors, fourteen were sophomores, and the remaining fifty-one were freshmen. The students were given fifty-five minutes to answer the questions, and were requested to be as brief in replies as adequacy would allow. All the students were well known to me, and there was a thoroly frank understanding that the purpose in the test was an honest attempt to ascertain as nearly as possible the exact condition of student knowledge of the Bible. I believe the answers are all honest, tho doubtless some of them are colored with a sense of conscious humor at the students' own predicament.

Only one of this quite representative group of students ventured to answer all the questions. That one was the son of an Episcopal rector. None answered all the questions accurately.

In the list of answers given below there are included only those which in some way depart from a straightforward correct answer to the queries, but all that do in any way vary from an accurate categorical reply are included in the list.

It will readily be seen that the answers fall into three classes. First, a few that by a fine emotional instinct suggest what by interpretation might be the correct reply: second, a much larger number that show that the students are totally ignorant of the true material which would suggest the correct answer, altho I do not believe, because of the thoro and sympathetic understanding at the outset, that there was any significant amount of real guessing—the student thought he knew; and third, a still larger number which indicate that the students have considerable knowledge of the Bible, but are confused thru inaccuracy of memory. No one of the answers reveals the lamentable ignorance of a law student who at one time in one of my classes undertook, during the course of writing a theme, to refute the adage that "the good die young," and as one of the items of refutation wrote the astounding statement that "Jesus Christ died at a good old age."

Similar attempts to this have been made to arrive at student information of the contents of the Bible in other institutions with a very different constituency from that of the University of Michigan, and some interesting theories have been propounded concerning causes and remedies. But here are simply the facts regarding our very cosmopolitan group. It would seem to be chiefly up to those who have pre-university train-

ing is hard to make what they will of them, the it is worth while noting that the papers in my possession show that these students farthest advanced in the university possess less accurate knowledge than the freshmen.

1. In what languages was the Bible originally written?

"Hebrew." "Greek." "Hebrew and Greek." "Hebrew Greek." "Hebrew and Latin." "Hebrew and Hellenistic Greek." "Hebrew and Arabic." "Hebrew, Greek and Arabic." "Arabic." "Sanscrit." "Sanscript." "Originally in Hebrew, and then in Latin." "Latin, German, Greek, French and Early English; there were also originals in Hebrew."

2. What names are given to its two main divisions?

"Old Testament and New Testament."

3. What do you think is the chief difference between its first and its second main divisions?

"The chief difference is that the first contains nothing of Christ, while the second does wholly." "The first is the prophecy and Jewish history, and the second is history and the essays of Christ and his apostles." "The Old Testament was written B. C., the new was not." "To me the Old Testament is largely figurative, representing Hebrew fable, while the New Testament deals with historical characters." "The Old Testament was written by we do not know whom; the events related there are just tradition, and the laws set forth show primitive ideas of religion which in some cases would be pretty hard to live up to." "The first part is historical and tells of the wanderings of the lost tribes of Israel." "In the New Testament the story is more connected than in the Old; in the New Testament every chapter is by a different man, and I don't know about the Old, but I don't think all the chapters were written by one man." "Perhaps the language of the New is more modern than that of the Old." "The Old Testament is mainly an exponent of the law, the New of a Father's love." "I think the chief difference between the first and the second main divisions is that the first division is historical and the second division is what might be called evangelical." "The Old Testament is composed very largely of stories and proverbs which are not any longer believed to have actually happened; it also contains a great deal of ancient history which is reliable, for the most part. The New Testament is composed largely of the life and works of Jesus." "The Old Testament is a history, and the New Testament is the memoirs of the apostles and was written after Christ's death."

4. Why is one of the smaller divisions of the Bible called "The Book of Exodus?"

"Because it was written by a different author from that of any of the others." "It deals with the leaving of the Jews from the Holy Land." "It is the one in which there is given a story of the flood and from this it receives its name." "So-called because it tells of the fall of Adam and his expulsion from the Garden of Eden." "Because it is the Book of Laws." "The Book of Exodus is so called because the word is *ex-odus*, or from *ruin*, meaning I think the work of bringing order out of ruin or devastation." "I suppose it is called Exodus because it is the first and tells about the people in the beginning." "The Exodus is the Book which tells of the Hebrew's trip from Egypt to the 'promised land.'"

5. What is meant by "The Law" and what by "The Gospel" as applied to the Bible?

"The Law means moral truth, or God's way of doing things; The Gospel means God's will." "The Gospel is the doctrines of theology." "The Gospel is the writings of the inspired Saints." "By The Law is meant the laws given by Christ to the disciples and the people, while The Gospel simply means the Scriptures as taught to the people." "The Law means the writings in the Old Testament; one generally says 'The Law of the Prophets.'" "By The Law is meant the old Rabbinical law which the Rabbis taught in the Synagogue; The Gospels were the letters which St. Paul wrote to the churches." "In the Old Testament definite laws were given to aid the morals of the people, such as the ten commandments and laws regarding circumcision; but the New Testament taught freedom, individual responsibility for one's acts."

6. In which of the two main divisions of the Bible would you look for "The General Epistle of Jude"?

"In the Old Testament." "The Epistle of Jude would probably be found in the Old Testament." "In the epistles of the Old Testament."

7. In what city was Solomon's Temple located?

"The Temple of Solomon was in Babylon." "In Tyre." "In Asia Minor."

8. To what things were the following names given? a. Nebo. b. Jordan. c. Sinai. d. Galilee. e. Nazareth. f. Nazarene. g. Nazarite.

a. "To a river." "To a river in Egypt." "To a city." "A mountain where Christ preached." "To a plain." "To a region." "The name of a man." "To a town." "The father of Joseph." "To the grave of Moses."

b. "It refers either to the river Jordan or to the man who took Moses's place as head of the Israelites."

c. "Sinai was a kingdom." "It was the place of the landing of the Ark." "The mount from which Christ spoke."

d. "Galilee was the land in which Christ loved to be." "A country in Asia."

e. "A city in Palestine on the Mediterranean." "A sea." "A province." "A town

in Egypt." "A city in Asia." "The Father of Christ."

f. "A race of People." "A woman of Nazareth." "The Mother of Christ."

g. "The birthplace of Jesus." "A name for one of the race of Nazarenes." "A tribe." "The followers of Christ were called Nazarites." "A man of Nazareth." "One who was born in Nazareth." "The speech of the Nazarite was marked in Peter during Christ's trial just before his death. The people knew that Peter was a follower of Christ by his speech." "I presume it is the name applied to an ordinary inhabitant of Nazareth as compared with the Nazarene, Christ."

9. Distinguish between Levi and Leviathan.

"Do not know what Levi means; Leviathan means large." "Levi was a High Priest; Leviathan was a whale." "Levi was a great priest; do not know what Leviathan was." "Levi was a man; Leviathan was the follower of this man." "Levi was a name applied to the priests; Leviathan to the rules laid down by the priests." "Levi was a term applied to Jews, a race small in stature compared with Leviathan, which meant large." "Levi was the name of a tribe, Leviathan of a city." "Levi was a tribe, and Leviathan the name of a country or highland." "Levi was a Son of Jacob, founder of one of the tribes of Israel, and Leviathan was the sea." "Levi was one of the tribes; Leviathan was a man." "Levi was the name of a man. Leviathan might be applied to his doings." "Levi was a Jewish male; Leviathan a woman." "Levi was a tax-gatherer."

10. What event is associated with each, respectively, of the following? a. The Garden of Eden. b. The Garden of Gethsemane. c. The Isle of Patmos. d. The Star of Bethlehem. e. The armor of Saul.

a. "In the Garden of Eden were Adam and Eve. It was here that Eve fell." "A place where Adam and Eve lived or roamed." "Where Adam and Eve lived and were created." "Eve tempted Adam, and sin then originated."

b. "With a noted sermon." "This Garden is connected with the intense suffering of Christ at the time of his temptation."

c. "Paul was shipwrecked there." "It is a place where the children of Israel were led in the Wilderness." "With the birth of one of the Apostles." "The solitary place of prayer of a great prophet." "Paul's epistle were written there." "Where some leper lived." "With John the Revelator."

d. "All answers correct and the unusual form of statement."

e. "Saul's feast with David." "A struggle between Saul and David." "When Saul with his armor was with Solomon." "Saul in armor leading the army when a boy." "Saul's fight with the Philistines." "Associated with him at great strength became him as a mighty ruler." "The armor of Paul." "The armor of truthfulness and righteousness." "Saul's righteousness, the armor which we should all wear." "The strength given to Saul after his conversion to the Lord."

11. a. Who wrote the celebrated eulogy on charity? b. Where is it to be found? c. What two other virtues at the close of the eulogy are compared with charity? d. Quote the words of the comparison.

a. "Luke." "St. Mark." "Christ." "St. John." "Solomon." "Matthew." "They may have been spoken by Jesus, but I think it was later written by Paul in his letter to the Corinthians." "Paul wrote the words on Charity, or, I believe, he preached them."

b. "In The Acts." "Book of Luke." "New Testament." "In both Luke and Mark." "Gospel of St. John." "Proverbs." "In the Psalms." "Epistle of St. Paul to the Romans." "In the New Testament—the first of the Gospels." "Cor. Book II."

c. "Hope and Peace." "Faith and Love." "Generosity and self-sacrifice."

d. "There be three things, Faith, Hope, and Charity, and the greatest of these is Charity." "There be these three things, Faith, Hope, and Charity, and the greatest of these is Charity." "Silver and gold I have none." "These three Love, Faith, and Charity, but the greatest of these is Charity." (Not one of the seventy-eight quoted this correctly, according to any version I am familiar with.)

12. At what age was Jesus crucified?

"21." "30." "31." "Between 30 and 33." "About 32 or 35." "33 as near as any one can [illegible] "34" "35" "45."

13. In connection with what event was each, respectively, of the following statements made? a. "Thou art the man!" b. "Almost thou persuadest me to be a Christian." c. "Before the cock crow twice, thou shalt deny me thrice."

a. "Judas said these words when he betrayed Christ." "The trial of Christ." "Our Lord spoke this to Judas." "The men who arrested Christ said it." "Either the betrayal or the trial of Christ: *Ecce Homo* is the name of a famous painting." "These words were spoken when the prophet in the chariot taught Christianity to the man at his side."

b. "Either Felix or Festus, the Roman officer in Jerusalem, to Peter." "St. Paul before he was converted." "Pontius Pilate when Christ was before him." "Nicodemus to Christ." "Probably in connection with the conversion of Paul." "The trial of Christ." "Festus, when Paul was making his defense." "It was said when Paul was defending himself before Agrippa (or Felix)." "Some King after listening to a Christian talking."

c. "At their last feast together, Jesus said it to his disciples." "What Christ said to one of the thieves who was hanged beside him in the Crucifixion." "The trial of Christ." "Christ to Judas."

14. From what event do we get the word "Shibboleth"?

"From a battlefield of that name in Judea. A tribe was so called by the Israelites because they could not pronounce the word Sabboleth." "From the battle between the Israelites led by Jephthah, and the Philistines." "The crossing of the Jordan by the Philistines." "The word means 'watchword.'" "Joshua had this word 'Shibboleth' to distinguish friend and foe, because the enemy were hill-men and could only say 'Sibboleth' when asked to say the word." "Samson made the enemy pronounce the word that he might distinguish whether or not they were Israelites." "I think that 'Shibboleth' originated with Gideon, and was used as a password to prevent those who were particular enemies, and who could not pronounce it correctly, from entering the Jewish camp."

15. a. Who said the following? "Behold the lilies of the field, how they grow; they toil not, neither do they spin; and yet I say unto you that even Solomon in all his glory was not arrayed like one of these." b. Who said the following? "O my son Absalom, my son, my son Absalom! Would God I had died for thee, O Absalom, my son, my son!"

a. "John." "John the Baptist." "Solomon."

b. "Absalom's Father after he found Absalom hung by his hair." "Abraham." "Abraham quoted these words." "King Saul." "Saul." "St. Matthew." "Elijah." "Mary, on beholding her crucified son."

16. What is referred to by each, respectively, of the following? a. The Call of Abraham. b. Jacob's Ladder. c. A Mess of Pottage. d. Aaron's rod that budded. e. The Sword of the Lord and of Gideon. f. The thirty pieces of silver. g. And suddenly there was with the angel a multitude of the heavenly host.

a. "Abraham was called by God to preach the Gospel." "Refers to a call Abraham received from an invisible voice to preach the Gospel of God." "Abraham was called by a message of God to sacrifice one of his sons." "Abraham's call to the leadership of his people." "To the time when Jesus appeared to him by the burning bush." "An angel came to Abraham and promised him a son if he would do a certain thing." "The call of Abraham was to lead the lost tribes of Israel into the promised land." "The call to sacrifice his son, but a goat was sent in place, when he had proved his faith." "When God called Abraham into the ministry."

b. "To a way of getting into heaven." "To a dream had by the youngest brother of a jailor's family, which showed his way to Heaven." "Jacob's dream about the ladder leading up to heaven with the *angles* climbing up and down." "A vision that Jacob had one night when he slept out of doors near a mountain which looked like a pair of stairs." "Jacob dreamed that he saw a ladder lead to Heaven and that the Lord was at the top."

c. "The Prodigal Son." "To the feeding of the children of Israel by God in the Wilderness." "To the Lord's Supper."

d. "Aaron was a leader of the Israelites—'Extol the stem of Jesse's rod, etc.'" "Was the symbol that brought the doves and manna to ground when the tribes of Israel were without food." "Aaron was the successor of Moses, and it was by his rod he could perform miracles."

e. "The sword of the Lord is spoken of in the Old Testament when the first-born sons of Egyptians were killed by the avenging angel." "When Adam and Eve were driven out of the Garden of Eden." "When the angel came and freed Paul from prison." "Gideon defeated the Philistines one night with the help of the Lord." "The avenging host in the Battle of the Red Sea."

f. "One of the Parables."

g. "The Revival of Christ." "This occurred at the time of the Crucifixion." "The Resurrection of Christ." "The time when Peter saw the 'Holy City'."

17. Where or from whom did you acquire most of your information as you have given it in the preceding answers?

"Mother." "Sunday School." "Sunday School Teacher." "My Mother, Sunday School, and a little study of the Bible in school." "Sunday School, Parents, etc." "Sunday School, Parents, the bible, and Epworth League." "The Sunday School, and Church, and by reading." "My Mother, Sunday School, and in general reading." "Sunday School, Church, and Bible reading." "Partly through Sunday School, and partly through 'picked up' reading." "Sunday School, parents, study of the Bible as source of literary allusion in the University." "With no reflection upon the Sunday School, I supposedly acquired my information there." "Much in translation from the original Greek Testament and in the Sunday School." "In reading the Bible alone." "Picked up from reading and from listening to conversation and sermons." "A German Lutheran Sunday School; this perhaps explains my ignorance of the subject-matter." "My Father is an Episcopal minister." "Took a course in 'Bible' before I entered this school." "Learned during instructions for confirmation." "From detailed reading of my own." "Parents, and Professors in the course in English Bible in the University." "Literary References." "I ought to know more, but what I learned I learned in German, and therefore I do not recognize all the terms used in the questions." "I hardly think 17 needs answering by me. 'An honest confession is good for the soul,' but it takes strong faith in self to maintain a balance after an exposition of this kind." "I have never looked between the covers of the New Testament; what I have learned of the Old Testament was in Bible class." "A Presbyterian minister and the Sunday School."

ANN ARBOR, MICH.

# Hunting for the Wild

BY JAMES HERBERT MORSE

TRAVELING in Europe last autumn and winter, with an eye glued to the car windows, the writer spent some months in looking for the Wild. Having an early date scored against his run of birthdays, he was possessed, almost obsessed, in fact, by a yearning for large, deep, shadowy forests of the sort dear to Bryant and Cooper. His ear had been attuned to

"the soft winds
That run along the summits of those trees
In music,"

and the music, rich in variety, was not always soft. There had been in it the piping of gales, the clang of tempests, the prolonged ocean roar of the northeaster. He could not altogether extrude the feeling that in grand oaks, spreading elms, beeches, maples, and the snow-loving conifers, while there was material for kindling wood, shingles and wood pulp, there was also an appeal to the higher imagination. The grand brotherhood of trees spoke to him a larger language. There was a kind of family life in the forest, a living together of the members of the family, the young with the old. There were venerable trees, looking down, perhaps pathetically, on two or three or four or five generations of their offshoots, or upsprings, and rejoicing in this community of generations. Groves were in his recollection that were paternally inclined, had in them the sense of home, where the strong arms of sires thrust back the north wind from a growing company of sons, yet not so strenuously back as to deny the youngsters a wrestler's chance of winning distinction. Besides their rooted love for earth, there was, especially among the stouter trunks, —the elders, and deacons, and choir leaders of the forest—an uplook, a sort of rolling of the eyes at odd times towards the stars. They seemed to feel a community of interest with the heavens, and, on Sundays at any rate, rolled out grand anthems to the centuries. There was in the writer's heart real echo of the poet's assumption that the groves were God's first temples, and yet not wholly built for the Sunday edition of the Gospel of Gain.

With such an obsession, the writer's eyes were glued to the car windows of seven separate nations. From England where he still heard the north winds in the splendid oaks and elms of his early home in the back centuries, he crossed to the Continent and struck the long bare lands of France. Little, lonesome tufts of wood of a meadowy mixed variety occurred, but so far apart that one tuft would disappear below the horizon before another came in sight. They were probably contributory to the little wood pile in the backyard, but would hardly furnish a sill for a thatched cottage. Then there were along the brook courses files of single trees, pollarded—that is, shaved to the smallest of tufts at the top. They followed the streams in their windings, yet there could be no song in their tops. A lark alighting there after a morning carol, expecting to hear in the brook song far below an echo of his rhapsody would have been disappointed. These ghostly files struck the mind more as a forlorn remnant of the wasted youth of France, survivors from Napoleon's marching grenadiers, and the writer was glad to see the conifers of the Jurassic range hurrying up the steep foothills to get out of France and escape conscription.

It was no better in Italy. Hardly a tree was admitted free of duty. Everything was taxed to fill the fig market, to round out the even millions of olive jars and marmalade pots. There were beautiful woods in the grotesque benches round the choirs of cathedrals where sinners sat early and late, but the land was as bare of religious inspiration as was the head of the tonsured priest. There were glorious stone pines in the Borghese home at Rome and thick-foliaged ilex on the Pincian Hill. But the Roman barber had been called in. The ilex was tonsured; the stone pine had been denatured and shaved so that the scars were visible quite up to the umbrella top. A fine grove it was still, counting for an over pampered relic of the age of the barons. In middle Italy, and especially north of the Apennines, the silk worm browsed in summer time on the mulberry leaf. The grape hung in clusters mile after mile on the mutilated boughs of a nameless tree, and made a checker-board

of the beautiful valley of the Po. If there was ever music there, it was the drone of the bee. Everything was monotonous to the eye educated to the joys of the primeval forest. To the ear every tree seemed to clink of the tax gatherer's box of pennies. Virgil might have written his Georgics there, but those delightful idyls which he stole from Theocritus could have had no sylvan echo in any part of the fertile valley of the Po.

In Switzerland, again, there was a rush of fugitive pine and larch and chestnut up the mountain side, but the grand chestnuts had been caught halfway and detained in the service of the table. If they showed trunks centuries old, as many of them did, it was only as stumps that could no longer climb—mere conduits for the chestnut juices to reach fruition in younger shoots that would "pay their keep."

There were fine groves at Lucerne, yet the alert eye soon discovered that they had been sown like carrots in straight rows for service. Any human interest to be had in the sight of them was like that in a procession of uniformed nuns, pretty enough, if one likes uniforms, and likes nuns, with their parade demeanor on, eyes always to the front, and none of that "sweet disorder in a dress" so dear to the Anglo-Saxon mind. There was a sonorous charm in a particular grove when the noon chimes of the good Saint Lodegar's Kirche rang up from the old town that dates back to William Tell, if William Tell ever was. But every tree had been planted by hand. All had grown to the same thickness, with the same slender stem, and every stem seemed under obligation to reach the same hight—88 feet, as the writer measured them. The bells made music among them, and an old civilization found its echo—very sweet, joyous and soothing on a Sunday, but not the wild music of our old forests. The regularity, the lining out, the spacing, the academic treatment of the whole grove—and it was a big grove, trailing up the foothills of Pilatus—disappointed. Nor was it any less disappointing to the poetic sense, when the traveler rode for two days across Bavaria and Prussia, traversing the whole of the German Empire. Here there were thousands of acres black with conifers, all evidently raised for the market; a thousand acres of four-inch trunks densely packed; a thousand of six-inch trunks; as many more of eight; and there they stopped. Hardly a grandfather tree among them all. Then they started up again—infant pines, a hundred acres of them, packed together like the younglings of an infant asylum out on apron parade. After them a thousand acres of boys, all of an age, in dense column, suddenly halted on the march and rooted. They were halted so that the next ten thousand acres might be assigned to as many regiments of young trees of the military age, ready to be drafted into the Kaiser's service and cut down handsomely in the ranks for the good of the Vaterland. Holland and Belgium were better. The groves were irregular and far more sonorous, being, as they were, within the range of the winds of the North Sea. The traveler began to feel at home among their somewhat unkempt acres of larch, maple, elm and birch. For some days he left the car windows and haunted the borders of wild lands.

> Within those woods of Arcady
> He chief delight and pleasure took,
> And on the mountain Partheny
> Upon a crystal, liquid brook
> The muses met him every day,

tho the mountain Partheny was handmade, and not a whit higher than any one of the seven hills of Rome. He haunted the wood and the mountain and recovered in a degree the old time magical lilt of his native forests when the gale was blowing and he was young. He wondered if the landscape gardener and the forest commissioner would reforest America in the French way, the Italian, Swiss or German way, or would keep in the Saxon traditions, and let his descendants of the third generation, already gathering, have some taste of the real, the genuine, the old-time Wild which Bryant, Cooper and Francis Parkman so loved. Or would the chestnuts be tonsured, the holm oaks be clipped, the pine be shaved up to the scalplock? Would the larch be sown in furrows, the Lombardy poplars troop over the rolling hills in files, following the plow? These questions have been burning in his mind ever since, and he now hands them over to the expert gentlemen who are to reforest our hills.

New York City.

## The World of Life

WHAT Dr. Wallace has to say on the laws of life and evolution is of so much weight that the present volume must attract great attention. He is not only one of the original protagonists of the doctrine of evolution, but it has interested him to study the bearing of it on the whole question of religious faith and theism. He is no materialist like Haeckel, and he is no agnostic like Huxley, nor does he avoid the conclusions like Darwin. He puts his faith positively into the title of his book, and finds in the organic life "a manifestation of creative power, directive mind and ultimate purpose." *The World of Life* is an argument to prove this conclusion from animal and vegetable life.

Fully two-thirds of the work is devoted to the workings of evolution under the principles earlier laid down by Darwin and himself. He still holds to the gradual processes of change under the survival of the fittest which account mainly for the production of the present forms of life. He has little faith in spontaneous appearances of new forms; and the notion of rapid changes under Mendelian development does not approve itself to him. In a most interesting way, and with more than a hundred illustrations, he treats of the floras and faunas of the world, of variation of forms and the laws of increase, of coloration of birds and insects for protection or recognition, and of the geological changes which in past ages have been active agents in hastening the production of new forms of life.

All this is developed with a view to the main purpose of the book, which is really theistic. At present it is the physicists and biologists, rather than the professional theologians, to whom one must look for the defense of natural theology, and Dr. Wallace is one of the chief of these. No theologian can afford to fail reading this book. Natural theology must base itself on nature, and to students of nature they must go. As in the Middle Ages every physician was said to be an unbeliever, so for many years it has been thought that the student of nature had got rid of God. But there have always been, from the beginning of Darwinism, stout defenders of theism, such men as Hugh Miller, James D. Dana and Asa Gray. There came a wave of unbelief, or agnosticism, with Huxley and Spencer, and concluding with Haeckel, but the tide has now turned; and Dr. Wallace has never been of their number.

The seven last chapters are given to elucidating what is the real purpose of the work. The argument is, that in all the processes of life and evolution there has been not only the action of mere chemical forces, but also a constant directive impulse which has guided growth in the individual plant or animal, and in its progressive development. He finds in the sudden appearance in nature of the feathered wings of the primitive bird, so different from the reptile from which it sprung, adapted to a different life, so wonderfully fitted for movement in the air, a proof of some directive force, which we may call God. Equally he takes the case of the transformation of the insect. It is a worm, feeding on leaves. It becomes stationary as a chrysalis, and then all its parts dissolve into a pulp; then this pulp begins to produce an entirely different kind of a creature, a butterfly with gauzy wings and glorious colors, which no longer creeps but flies. In this transformation he sees some directive power which is not of itself, nothing chemical, and which guides it. He takes the same course of reasoning with the protoplasm of the cell, shows its amazingly complicated chemical constitution, and asks how these various atoms were led to combine in such a definite way. He insists that this is not the effect of the mere attractions of atoms or molecules for each other, but that there is also a real vital principle which we call life, and that some intelligent power must have guided all these

processes. He complains that biologists have been content to note the successive movements and changes, as in the fertilization and development of the cell of an egg, but have stopped there, and have not asked what made these atoms start off in new directions and create new organs. Why out of the common and identical blood do there start to grow in the spring the enormous horns of the stag, or why when the bird moults do the elements in the blood hurry off to build new feathers, just the right one in the right place, strong wing feathers, soft feathers for warmth, and the feathers on the two sides just matching each other in shape, size and color? There is some directive force, very wise, absolutely constant and universal. Dr. Wallace stoutly resents the contempt of materialistically monistic biologists, who can see in all this mere chemical atoms acting in their own way, and he discovers above them the spiritual directive intelligence of God. Further than this, he does not hesitate at length to argue that man is the crown of the kingdoms of life, and that all this directive impulse was meant to look forward to him, and that animals and plants are provided for his comfort, and that suffering and death itself are part of a wise purpose. These chapters are very suggestive.

We would add that the vigor, the breadth of knowledge, and occasionally the consummate force of Dr. Wallace's style, contemporary as he is of Darwin, are more than one could expect from a man in his eighty-ninth year. Mind is not all matter.

## The French Revolution and Republic

THOSE who cherish the study of French history and institutions will welcome and regard as a happy omen of our day the publication of two new works about France: a translation of Aulard's already famous political history of the *Revolution*[1] and Bracq's volume on the *Third Republic*.[2] The former is from the pen of perhaps the most profound and tireless student of the Revolution that the modern school of history has produced. He is, however, no mere dry-as-dust annotator of documents, nor, speaking in the language of a contemporary Illinois judge, does he pretend to ignore as a scholar what he knows and feels as a man. M. Aulard is liberal and democratic in his sympathies, and to him the French Revolution is not a reign of terror but a long series of halting measures by which popular government, to the good of all mankind, was got under way. His frank purpose he puts forward in his preface: it is to write the political history of the Revolution from the point of view of the origin and development of Democracy and Republicanism. To do this he has brought under survey the pertinent events of the period from the calling of the Estate General in 1789 to the establishment of the Empire in 1804. He writes upon such themes as Democratic and Republican ideals at the opening of the Revolution, the middle class and the people, the formation of the radical parties, the flight to Varennes, the meeting of the second assembly (1792), the fall of the monarchy, the Republic, the several constitutions of the revolutionary age, parties and their principles, the several revolutionary governments, religious problems, and social classes. There is a thoughtful combination of the chronological narrative with a connected account of ideas and institutions so that one who has even forgotten his outline of the momentous fifteen years covered by the work can follow M. Aulard with little effort—certainly without that effort required to keep pace with Carlyle's rushing periods and elusive allusions. The tangled skein is further straightened out by the chronological tables and biographical notes which accompany each volume. Whoever has put aside for the time military, diplomatic and financial matters and desires a clear, readable story of the political ideals and achievements of the Revolution will find M. Aulard's book the best thing in the English language on the theme. It will certainly find a place in every library to which men and women with an interest in history turn for sound and helpful guidance. It is a pity that we have no such a work to bridge the history of France from 1804.

[1] THE FRENCH REVOLUTION. *By A. Aulard.* 4 volumes. New York: Charles Scribner's Sons. $8 per set.

[2] FRANCE UNDER THE THIRD REPUBLIC. *By J. C. Bracq.* New York: Scribner's Sons. $1.50.

Meanwhile we are grateful for a beginning at this end—for M. Bracq's review of the *Third Republic*. This author has attempted, he tells us, to gage the great political experiment of France during the last four decades and to take an inventory of the constructive and reformatory work of the Republic. Happily we have in M. Bracq, as in M. Aulard, a temperate and sympathetic author who would defend the fair name of the Republic without being blind to many faults. He shows without bombast how great have been the achievements of France in social reform, letters, art, education, industry and science since the disaster at Sedan, and no one can rise from these pages without having a profounder respect for that nation which so many sciolists would treat as decadent. Ministries have changed with lightning rapidity but wise, humane and progressive legislation has gone on in spite of the vicissitudes of party politics. Under the Third Republic, for example, the judiciary has been authorized to take children away from vicious parents, and the legal status of women has been raised. "Women may now study and practise law or devote themselves to any science or art. The legal and social progress has been such that Mme. Curie has become a professor of science at the Sorbonne and occupies one of the foremost chairs of French higher education." French scholars have adorned with their labors every branch of learning: Gide in economics, Tarde in sociology, Berthelot in chemistry, Poincaré in mathematics and philosophy, De Coulanges and Lavisse in history, and so on—a mighty roll could be made of scholars whose achievements are counted among the precious possessions of mankind. On the score of morals our author is emphatic: "Never have moral considerations so determined French philosophical thought, and never were there so many books written on morals or on the moral aspects of education, of politics, philosophy and sociology." French education, far from being atheistic, embodies elements of religious instruction that would not be tolerated for an instant in the secularized schools of the United States. Finally there is the vexed and vexing question of the Church. M. Bracq is firm here, he says in a forthright way that separation was inevitable, and in line with the world's advance. This volume is prayerfully commended to the Teutonized universities of America.

*

**The Old Testament in the Light of the Ancient East.** Manual of Biblical Archæology. By Alfred Jeremias. Translated from the Second German Edition, revised and enlarged by the author, by C. L. Beaumont. Edited by Rev. Canon C. H. W. Johns. 2 vols., 8vo, pp. xxx, 352; xii, 331. New York: G. P. Putnam's Sons. $7.

The German author is a scholar of distinction in the Oriental field, and the original volume, here expanded by the printer into two volumes, is one of the best works to introduce the biblical student into the mysteries of Babylonian comparative literature. We wish now that the English publishers of the "Theological Translations Library," of which these are vols. xxviii and xxix, would add to the debt we owe them by giving us Gressmann's "Orientalische Texte und Bilder zum Alten Testamente," and they would thus give us pretty much all the old textual material, Babylonian, Egyptian, Syrian, Moabite or Palestinian, with all the important pictured material to illustrate the Old Testment. To the reader of these two volumes the least valuable portion will be the first chapters, devoted to the argument to show, after Zimmern, how much of the Babylonian, and so even the Hebrew, religion was derived from the ideas on the heavens, and particularly the zodiac and the calendar. When the author passes into the discussion of the creation story and the times of Abraham, and so thru the Old Testament, the wealth of illustration and information is large and valuable, altho the reader need not accept what is occasionally said as to the astral relations of Abraham and other biblical patriarchs. We particularly call attention to the numerous illustrations from ancient art, altho we may mention that the little monument given in Fig. 44 is not genuine, and that the one given in Fig. 57 is not in the British Museum, but in the J. Pierpont Morgan Library, and that some of the half tones, Fig. 161, for example, are less distinct than in the German edition. In ii, p. 316, for "Hivites," read *Horites*.

**Brazenhead the Great.** By Maurice Hewlett. New York: Charles Scribner's Sons; $1.50

We think we have outgrown the "tell me a tale" period of years till Mr. Hewlett comes along with this swaggering extravaganza of brawn, villainy and honor, which holds our interest now quite as firmly as did the equally marvelous tale of "Jack-the-Giant-Killer" some years previous. We must confess that we like Mr. Hewlett's earlier style better than that he has adopted of late. To be able to tell a brave tale that conceals no problem and nourishes no moral in this day and generation commends itself as a flower would that grows up amid tares. It had begun to look as if novelists had lost the art of romancing happily upon a zephyr of imagination without flying in our face at the last moment with some "vital truth." The time of this story, like that of all good stories, is indefinite and unlimited, beginning somewhere during the tyranny of the hunchback of Milan and ending with a flourish during the Mortimer rebellions in England. Brazenhead the Great, the central figure of the adventures told in these pages, appears before us like the fond recollection of an heroic illusion. To meet again a hero of herculean stature and strength with a taste for knavery, robbery and battle and a fondness for love and romance, who is generous to the unfortunate and hostile to the powerful, who picks his teeth with a dagger and sharpens them with a file, who has fierce mustachios and beetling brows—to meet such a one is like returning home after a long absence in strange and curious countries.

**Potash and Perlmutter.** By Montague Glass. Garden City, New York: Doubleday, Page & Co. $1.20.

Potash and Perlmutter's cloak and suit wholesale house has been known to the readers of the weekly magazines for some time, and the partners are men whom it is a delight to know. Their English is that of the recently naturalized alien, their ethics are those of a business prize-ring; the customer who deals with them needs his eyes open and a full set of canines; yet they have a sense of honor all their own, they are kindhearted, even generous at times, and, altho their language in speaking of each other is often condemnatory, and of a lurid picturesqueness of invective, we know all the time that they are really good comrades as well as partners, and honestly fond of each other. As Morris Perlmutter sagely remarks at the close, "Actions speak louder as words."

**Finland as It Is.** By Harry De Windt, F. R. G. S. New York: E. P. Dutton & Co. $1.50.

The author of *Finland as It Is* is an industrious journalist, but a careless observer. He misses as much as he gets. The unfortunate part of this habit is that thru a book like this some innocent travelers may be led astray. The present volume might as well be called "Finland as It Is Not." Mr. De Windt has the knack of turning out a readable book, but there is no evidence that he knows much about his subject or that he wastes much time verifying his references. He takes his readers on a pleasant, comfortable journey thru this beautiful and picturesque land. His itinerary for a holiday is not bad; but any holiday in Finland is bound to be interesting. Mr. De Windt saw enough of the country to give his readers some notion of its rare beauty and charm, but he didn't trouble to absorb atmosphere, acquaint himself with conditions or familiarize himself with the character of the people. Some of the illustrations from photographs are good.

**English Literature in Account with Religion: 1800-1900.** By Edward Mortimer Chapman. Boston: Houghton, Mifflin Co. $2.

Inasmuch as religion deals with the highest interests, ideals and aspirations of man, and literature at its best must do the same, the two will always be, as they always have been, closely related in their subject matter and terms of expression. They engage the attention and inspire the thought of individuals endowed with the same high order of intelligence, sincerity and moral devotion. Sometimes in defense and as a vehicle of passionate expression, and sometimes in bitter antagonism and revolt, literature finds in religion its themes and inspiration, and

religion becomes more humanized thru literature's contribution. It is to give some account of this objective relationship and interdependency during the nineteenth century that Mr. Chapman has written his book. His task leads him away on a rather haphazard, easy-going kind of venture into various fields, sometimes busied with biographical details, occasionally dropping into a discussion of philosophical tendencies, but generally engaged in making critical surveys and estimates of the literary work and influence of the leading literary characters in England and America during the last hundred years. The book has no brilliancy or verve in its style, and sometimes its erudition has a pedantic flavor, but it is filled with happy characterizations and always moves, even if it is in a gossipy way, in distinguished circles of thought, literature and life.

**Brother Copas.** By A. T. Quiller-Couch. New York: Charles Scribner's Sons. $1.20.

We generally term Mr. Quiller-Couch's style whimsical and let it go at that. But, after all, this is but a sort of dodging word, which does not express our surprise that a man can write a really tedious book which yet holds our interest. For, whatever may be said of this author's previous works, in *Brother Copas* he has given such latitude to his characteristic style that the reader becomes at times confused by a multitude of details. Mr. Quiller-Couch, in a note to the reader, says that the intent of this book is "to express something of that correlative scorn which must come sooner or later to every man who puts into practice his faith in his fellows and in their capacity to treat life as a noble sport." The story, in brief, is of the life of the inmates of St. Hospital by Merton, in England, or the "College of Noble Poverty," according to the author, and more particularly of Brother Copas and Brother Bonaday's little daughter. But this author is not one to go quickly at his story. He rather makes of it a literary sampler, at which he begins very daintily, with a careful precision that will permit of no haste. He first works a border as appropriate to the central figures of his sampler as the wall of Troy would be to a Hector dragged at chariot wheels. It is a border of scholasticism and theological broils, which as it grows in complexity of pattern threatens the central figures till the author finally evolves in the course of his embroidery the text, "And a little child shall lead them."

**Fenella.** By H. L. Stuart. Garden City, N. Y.: Doubleday, Page & Co. $1.20.

The author of "Weeping Cross" has produced another notable novel in *Fenella*. The heroine is charming and Mr. Stuart has the gift, which is rare among novelists, of conveying her charm to the reader. It is often fatiguing to look at a heroine thru the author's eyes, and to take his word for her fascinations. Promptly we fall in love with Fenella. She is only a little dancer, with a vocabulary limited to "about three hundred words," not a bit intellectual, not always refined, but so gentle, loving and unselfish that we are her partisans from the very first. "All the fairies were at her christening, even to the fairy Gratitude, who, I hear, is not often asked out nowadays." We get a clear image of her dark beauty, of her dramatic power as a dancer, and of her loveliness as a sweetheart, as well as of her goodness—a true-hearted woman.

**Pay Envelopes.** By James Oppenheim. New York: B. W. Huebsch. $1.25.

One might expect the book *Pay Envelopes*, by James Oppenheim, to treat of the salaried class as well as the wage-earning class, for both look forward to Saturday night; nevertheless, nearly all the chapters are devoted to the laborer in mill, mine and factory. Lafcadio Hearn, in one of his "Japanese Letters," congratulates the Latin lands that

> "they have not developed that awful thing, an industrial center, as the English and the Americans have the industrial center, whose blood is steam, whose nerves are steel—devouring the weak, consuming the strong—the machine in whose cogwork each man knows himself caught and doomed to whirl forever."

Mr. Oppenheim has seen the horror and the pity of this machine, and unlike Hearn, has undertaken to render it. He is more than commonly successful in all but his representation of character. He

neither individualizes his work people nor makes them plausible. But the cog matters how real it is to him and to his reader!

**The Feeding of Crops and Stock.** An Introduction to the Science of the Nutrition of Plants and Animals. By A. D. Hall, M. A., F. R. S. 1909, pp. xvi, 298. New York: E. P. Dutton & Co. $1.50

The author is the director of the Rothamsted Experimental Station, in England, the most famous agricultural experimental station in the world, where experiments have been carried on scientifically for nearly a hundred years. There can be no better authority than the present author, and at Rothamsted more important agricultural discoveries have been made in the way of the value of manures, rotation of crops, etc., than anywhere else. Such a chapter as that on "Artificial Manures and Fertilizers" would be of very great value to any intelligent farmer. The relative importance and use of the three great manurial elements, ammonia, phosphorus and potash, is admirably explained, showing which is of the most importance under varying conditions. Much has been said of late as to the power of leguminous crops to fix nitrogen, and the chapter on this subject is very instructive. For the cultivator of the land who raises crops or animals such a work as this cannot be too warmly recommended.

**The Territorial Governors of the Old Northwest:** A Study in Territorial Administration. By Dwight G. McCarthy. Iowa City: State Historical Society of Iowa.

Mr. McCarthy's brief survey of the administration of the old Northwest in its various territorial forms is useful, if not especially inspiring. In Western history the same temptations have stood in the path of writers that have so often tripped up the historians of New England. These latter have often been unable to resist the allurements of the discovery, Plymouth Rock, and the Revolution, and have overlooked all the normal life that lay between. So the historians of the Northwest have founded Marietta and fought at Tippecanoe without letting their writings illuminate the less spectacular development of the region in its transition from frontier to Statehood. Mr. McCarthy gives considerable unity to the history of the Northwest for two generations as he traverses the common ground of the ordinance of 1787, St. Clair and Harrison, and exploits the newer field of Cass, Mason, Doty and Dodge. The book is beautifully printed and the bibliography is useful.

**The Legacy.** By Mary S. Watts. New York: The Macmillan Co. $1.20

Readers who admired Mary S. Watts's story, "Nathan Burke," last year, will be interested to know that her new novel is equally well conceived and decidedly more interesting. The title, "*The Legacy*," does not refer, as one might suppose, to a fortune bequeathed, nor to any heirloom with a dark and tragic history, but to a little, crooked, lifted smile painted upon the lips of a dead and gone grandmother who was beautiful and bad. Apparently it was the red quotation marks, indicating heredity, which displayed itself here and there in her descendants, and which was especially uncorked in the latent character as well as in the obvious likeness to her of her greatgranddaughter, Letty Breen, the heroine of this book. And the story closes with this question which Letty asks herself and which every reader will answer according to his own wisdom and understanding: "Am *I* a good woman—a bad woman? I do not know!" For our part, we think she was a supernaturally good one, and a naturally bad one—a definition that might well fit almost any particularly admirable character. But read the story for yourself. It is worth it, not cheering, but enlightening, like any faithful gospel of life. The author humors you with few pleasantries. She has a singular virtue in the use of words, and now and then a wit as devastating as that famous jawbone of an ass. You will bear the marks of it upon your own consciousness by the time you have finished the tale. Letty is a silent, satirical, but very clear mirror, held up before "Everywoman." And "Everywoman" is apt to find the story biographical in one or more particulars, altho, of course, she will not admit it.

## Literary Notes

....An acting version of *The Antigone of Sophocles*, in the English translation of Professor Joseph Edward Harry, comes to us from the Robert Clarke Co. (Cincinnati; $1). This version does not attain enkindling nobility of line.

....A popular edition of Rev. J. Hamlyn Hill's translations of the Diatessaron of Tatian has just been brought out in Edinburgh (Scribner's, $1.25 net) under the title of *The Earliest Life of Christ Ever Compiled from the Four Gospels*. It is supplied with notes and a short, serviceable introduction.

....From McClurg we receive two volumes by Charles F. Lummis; *My Friend Will* and *The Gold Fish of Gran Chimú* (75 cents each). The first is a story of the pluck that wins out in the face of tremendous difficulties; its scene the New Mexico plains; the second has for its background picturesque Peru.

....From the press of The Biglow & Main Co., N. Y., comes *The Mission Hymnal* (35 cents). It is the first hymn book of Gospel Hymns, combined with Standard Church Hymns, ever published for use in the Protestant Episcopal Church with its official sanction. It contains the words and music of many of those favorite old hymns whose fame will never die.

....*By Fell and Dale at the English Lakes* is a new book about Cumberland by Rev. H. D. Rawnsley, published at Glasgow by MacLehose, but imported by the Macmillan Co. ($1.75). The writer's fund of interesting comment upon this district of England is inexhaustible, and the new volume, with its delightful illustrations from photographs, is more than welcome.

....The *Register of Porto Rico for 1910*, prepared under the direction of Hon. M. Drew Carrel, Acting Secretary of Porto Rico (San Juan: Bureau of Supplies, Printing and Transportation), is a bound volume of 328 pages, illustrated from photographs and maps. A great deal of official and historical information and no little commercial and agricultural data are to be found here.

One of the safest and most helpful discussions of health and hygienic problems will be found in *The Nervous Life* (Sturgis & Walton, $1) by Prof. G. E. Partridge, Ph. D. The author holds that the causes of most of "the modern ills of the nervous life are part and parcel of the order of events," inherent in the conditions of a progressive civilization. For the proper alleviation of these ills people need to suppose little more than increased knowledge and common sense.

....*A Dictionary of Ecclesiastical Terms* (Lippincott; $5) by John S. Bumpus, Hon. Librarian of St. Michael's College, Tenbury, is a work embodying a good deal of curious and scholarly information about the history and use of terms connected with the architecture and worship of cathedrals. The alphabetic order is observed and the author gives usually the corresponding Greek, Latin and French terms, but the discussions are almost entirely confined to topics connected with the Established Church of England.

....James Hosmer Penniman's *Making the Most of Books* (Syracuse, N. Y.: C. W. Bardeen & Co.) is a slim volume of 99 pages, with chapters on such subjects as "The Miracle of Books," "How to Use Books," "Cultivating the Memory," "The Abuse of Books," etc. Most of what Mr. Penniman writes has been said before, and said just as well, and there is a dryness about his style that some will term sententious. In spite of all this, *Making the Most of Books* is a volume which, placed in the right hands, may very well bring forth good fruit.

....Our chief criticism of the French author who signs herself Pierre de Coulevain is that she is almost intolerably long-winded. Her *Isle Inconnue* now makes its appearance in English—and in spite of the fact that Alys Hallard has made an excellent translation the defects of the original—egoism one of them—remain obvious enough. Yet the French tourist is a clever observer of things Britannic, and her book had so much success in France, some years ago, that we see no reason why it should not please a great many American readers too. (*The Unknown Isle*. By Pierre de Coulevain, author of "On the Branch." Cassell; $1.35.)

....In H. DeVere Stacpoole's *Patsy* (Duffield; $1.20) we have another example of this sprightly novelist's good-natured and entertaining style. The book gets its title from the name of a tousled-headed youngster, the gamekeeper's son, who enters the service of an old peeress and grasps the opportunity to save more than one situation. There is a love story of course—but what is best is the liveliness of it all and the picturesqueness of the not too subtly rendered characters. Mrs. S. C. Hall, in her *Tales of Irish Life and Character* (McClurg; $1.75) is less sprightly indeed, but makes even more of the *genius loci* and of Irish manners, so refreshingly unhackneyed.

For many years Prof. Flinders Petrie has worked among the ruins of Egypt, excavating, studying and describing the remains of the ancient civilization of the Nile Valley. He has become more familiar with the long

[illegible] treasures of that wonderful land. In his new volume on *The Art and Crafts of Ancient Egypt* (McClurg; $1.75) Professor Petrie utilizes his large stores of knowledge and presents in abundance of evidence from his camera to illustrate and describe the character and development of work done in Egyptian art. Altho one might question the validity of some of the author's definitions and deductions, his discussions are always stimulating, and the half-tone reproductions, one hundred and forty in number, not only make clear his theories, but form a very attractive feature of the book.

....If any more argument were needed to show the unwisdom and weak foundation of the claims made for *The Historic Episcopate* (Westminster Press; $1.50) the careful presentation of the subject given by Prof. Robert Ellis Thompson would surely meet the demand. The matter would be of little interest to those outside the limited circle of faithful believers in its divine prescription, except that it acts as a great obstacle to Church union. Prof. Thompson has devoted many years to a study of the question and his book following the historical method of treatment is scholarly, dignified and ironic. It is to be hoped that it may do much good by putting accurate knowledge into the place of blind prejudice on both sides of this ancient controversy.

....Coleridge was an unusually fecund letter writer; almost 1,200 of his epistles have been preserved. A good many of these—some 210—furnish the basis of *Biographia Epistolaris*, "Being the Biographical Supplement of Coleridge's Biographia Literaria, with Additional Letters," edited by A. Turnbull (London: G. Bell; New York: The Macmillan Co.; two volumes, $1 each). The editorial work is done skilfully and abstainingly, and the letters themselves, collected from various sources, are indeed the best record of the personality. Coleridge lacks charm as a correspondent, if we compare him with Cowper, with some of his contemporaries, and with one or two later comers; but there is no mistaking his erudition, high seriousness and critical force.

....The Aran Islands have been annexed by the literary historian only very lately: that is, since John Synge visited them and made himself at home on their bleak rocks and in the huts of their almost unbelievably simple cottagers. Synge's account of the islands and their interesting population has recently been reviewed in this department, and we called attention to the fact that the Irish dramatist found in them plots and characters for more than one of his masterly plays. The natives are among the poorest of the Irish people, living for the most part by agriculture practised in the stoniest of fields, and by fishing. For some years they have been unable to pay rates and taxes to the Galway County Council, under whose jurisdiction they live. The council has now made arrangements for a police expedition to descend upon the islanders and compel them to pay tribute, and a steamer has been chartered to land one hundred armed constables on the islands. The people say they are fully prepared to prevent a landing. They are also preparing to barricade their beehive huts.

....Only keen powers of observation and extended acquaintance with life in the Turkish empire could serve as a background for such a book as that of Lucy M. Garnett on the *Turkey of the Ottomans* (Scribners; $1.50). The various races and their characteristics are described, the new political organization of the empire is reviewed, and the religious and social customs, so varied in different sections and among neighboring populations, often antagonistic to one another, are carefully delineated. Miss Garnett gives an extended account of the system of education and the development of agriculture, writes intelligently of army reform and home-life in the provincial towns, and does not neglect such subjects as folk-beliefs and country amusements. The illustrations present vividly many phases of the life described in the text.

....Every one familiar with the facts knows that the conditions of medical practice open the way for unlimited temptation to abuses which bring discredit upon the profession and entail untold suffering upon humanity. Not every physician, however, is willing to acknowledge or openly proclaim that human weakness has led so large a number of his fellow practitioners into evil ways as does Dr. Norman Barnesby in his *Medical Chaos and Crime* (Mitchell Kennerley; $2). But in taking the public into his confidence and exposing some of the reprehensible practices indulged in by many physicians even of "reputable" character, Dr. Barnesby makes a strong attack on an outgrown system of medical ethics which counsels secrecy and mystery in all professional things, and argues courageously for social conditions which would present fewer temptations to laxity and wrongdoing. Most of the abuses cited relate to surgery, and it seems possible that they could be largely corrected by well-organized supervision. The most effective remedy will be more knowledge on the part of the laity, and this book will contribute its share to this desirable end.

....Miss Anna Chapin Ray's new novel *A Woman with a Purpose* (Little, Brown; $1.25) deals with the cure of a man of the drink habit and the cure of a woman of the habit of wilful uncharitableness.

....*Master Christopher,* by Mrs. Harry de la Pasture (Dutton; $1.35), differs from most novels of the day in having an ending that quite satisfies the reader's sense of justice; the property in the right hands, the villainess foiled, and eminently suitable marriages and deaths.

....The reader will find in *Non-Church-Going* (Revell; $1) the opinions of thirteen prominent English ministers and laymen as to the reasons and remedies of the decline in church attendance. They all agree as to the existence of the evil; they agree fairly well on the causes of it; but they are far from agreeing on how the condition can be improved.

....Until we dipped into Lieutenant Howard Payson's *Boy Scouts of the Eagle Patrol* and *Boy Scouts on the Range* (Hurst & Co.; 50 cents each) we had supposed the Red Indian of juvenile fiction dead and perhaps buried. But he is resurgent—on the Arizona plains; tho only to bite the dust once more, while revolvers crack and rifles bark (or do they spit?).

....A book of solid proportions on the *Dry Fly*, might at first be taken for an entomological monograph, but on opening the pages it is discovered to be an exhaustive treatise on the fly for the fisherman's tackle. Figures, colored plates and half tones profusely illustrate the text, and we venture to say that there is little left unsaid on the subject. (E. P. Dutton; $5.)

....The American Book Company has brought out the second part of Prof. Gildersleeve's great work on the *Syntax of Classical Greek* ($1.50). The veteran scholar has had so far the aid of Prof. Miller, who furnishes most of the material on the "Article" in this volume, but he announces that what remains of his original plan he hopes to have published in outline without further assistance.

..Whether or not one accepts in full his interpretations Mr. Joseph Wicksteed's book on *Blake's Vision of the Book of Job* (Dutton, $2) is a significant contribution to the man of writings about the symbols and who has been the subject of so many writings in late years—writings scarcely less mystical and mysterious than his own. Chesterton would have us accept Blake as a practical-minded man with feet of clay; the present critic would have us see in him an illustrator whose designs, no less than his words, stood for definite ideas which it is his own task diligently to translate for the uninitiated.

....Mr. F. A. Myers indulges in some very plain speaking when he discourses on the unfavorable environments and unintelligent methods of race culture under which *The Future Citizen* (Sherman, French & Co.; $1.20) of our country is being produced. The author ranges over a great variety of subjects from race suicide to socialism, from mental inheritance to child labor, but he always has something to say worthy the attention of serious readers.

....From Dutton we receive *Cities of Southern Italy,* by Augustus J. C. Hare, edited by St. Clair Baddeley ($1.75). Like the other Hares, the book is a valuable supplement to more businesslike guides, principally because of its sense and representation of the literary background; but just why there should be printed the quite inadequate notes on hotels, etc., we cannot see. These notes should be extended or abandoned.

....In *The Call of the New Era* (American Tract Society; $1.25) Rev. William Muir traces with considerable skill and effectiveness the manifestations of the missionary spirit in various epochs of Christian history. With this as a background, he portrays the urgency in the present crisis for redoubled zeal in missionary enterprise and in all efforts of the Church looking toward unity and efficiency both at home and abroad.

....Dr. William M. Thomson's *The Land and the Book* is standard; it has been reprinted more than once, and is issued now again, the two columes in a single, thick, handsome volume, suitably illustrated, and provided with maps. Dr. Thomson was for many years a missionary in Syria and knew the customs of the people as few have known, and the book is a rich and trustworthy treasure house of illustrations of Bible manners and customs. It belongs in every library where the Book is loved and studied. (Harper & Brothers; $2.40.)

....Mr. Ralph Waldo Trine makes a significant departure from his accustomed paths in the most recent of his "Life Books," entitled *The Land of Living Men* (Crowell; $1.25). Leaving the specifically individual and inspirational he delves into social and economic conditions and problems making a strong plea for the government ownership of public utilities and monopolies, and for the general use of the initiative, referendum and recall, as a means of checking poverty, uplifting the working classes, and furnishing equal opportunities for all. While the ideas and arguments of the book are not new they are put in a fresh and stimulating way.

....Not many are so well equipped to speak with confidence on various *Aspects of Islam* (Macmillan; $1.50) as Prof. Duncan B. Mac

Donald whose new volume is a welcome addition to the published series of Hartford Lamson Lectures on the religions of the world. His scholarly attainments in the fields of Arabic Literature and History, his experience as a traveler in Mohammedan countries, and his work as a teacher have made it possible for Prof. MacDonald to write interestingly and accurately on those aspects of Islamic life and culture which most concern missionary workers and students of religion.

....We have from Funk & Wagnalls vol. x of the new *Schaff-Herzog Encyclopedia of Religious Knowledge,* which will be completed in twelve volumes. This volume ranges from "Reusch" to "Son of God." It thus includes special articles on the Roman Catholic Church, written by competent Catholics and sets forth the doctrines and worship of the Church, and also its position as to parochial schools and the use of the Bible in the public schools. In these articles the position of the Catholic Church is clearly but not polemically given, and deserves consideration. Other titles included are "Revelation," "Rimmon," "Ritualism," "Russia," "Sabaoth," "Sabbath," "Sacrament," "Sacred Music" (very full), "Sacrifice," "Samaria," "Samson," "Savonarola," "Schleiermacher," "Science, Christian" (approved by Mrs. Eddy, followed by other critical articles), "Second Advent," "Semitic Languages," "Serpent Worship," "Sin" and "Slavery." We repeat previous commendations of this admirable work ($5).

....In the highly desirable edition of Pater's works in course of publication by Macmillan appears a volume of *Miscellaneous Studies,* essays in literary and art criticism ($2). There are examples both of the writer's early and of his late manner. Nothing is more interesting than this consummate stylist's notable appreciation of a style which contrasts violently with his own. "Mérimée . . . was not a man who used two words where one would do better," he writes, "and he shines especially in these brief compositions which, like a minute intaglio, reveal at a glance his wonderful faculty of design and proportion in the treatment of his work, in which there is not a touch but counts. That is an art of which there are few examples in English." Again:

> "The merits of Pascal's style, indeed, as of the French language itself, still is to say *beau coup de choses en peu de mots;* and the brevity, the discerning edge, the impassioned concentration of the language are here one with the ardent immediate apprehensions of his spirit."

The phrase of a Mérimée, of a Pascal, is ultimate; but one feels that the love of the artist is for the portrait, the idea, or the truth, rather than for either tools or technical effect. Pater too, works for the final expression of the idea, but did he not always almost fatally want something of severity for his own language—as decoration and enrichment?

## Pebbles

OUR MUCK-RAKING DEPARTMENT—HORRIBLE CONDITIONS DISCOVERED IN OUR LEADING RESTAURANTS.

By Buster Brown Smith.

The other day I was strolling quietly along Fifth Avenue, wondering how I should advertise the magazine, and incidentally earn enough to take another flyer in the stock market, when I caught sight of a large, fat man ahead of me.

I recognized him at once as a leading head waiter. By his walk I knew that he had been eating red cabbage. Where had he got it? In no other place but the market. What did this mean? Simply that he was getting a rake-off. This reflection led me to follow him. The results are given herewith.

The restaurants of New York are reeking with graft. I say reeking advisedly. I know what I am talking about. I have a reputation behind me and in front of me—such as it is—to sustain.

There is not an honest palm room in New York.

An instance:

Last week the price of Southern-grown asparagus in the open market was reduced five cents a bunch. What happened? Every palm room in New York added twenty-five cents to the price of each portion.

Who got it?

It is the same with carrots, parsnips and ice cream. This, however, is nothing. I am coming to something big. Read on. I get ten cents a word, and you mustn't stop or my reputation will be ruined.

The waiters are in a conspiracy. Last week I saw a lady from Jersey City—a kind-hearted, open-faced lady, who never did any harm to any one, thrown out of one of our leading palm rooms.

Why?

Simply because she hadn't engaged a seat there three months before.

Another woman—an upper Fifth Avenue woman—sailed by and pressed—actually pressed—a five-dollar bill into the hand of the head waiter.

What was the result?

It is this phase of our national life that appals me. It makes me ask, What will the end be? It fills me with a sickening sense of unrest.

In the next installment I shall deal with the rake-off on salads. SMITH.

Note by the Editor: Since Mr. Smith began his articles our circulation has doubled—nay, trebled. The nation awaits with breathless interest what he has to disclose in the next issue. In the meantime there are a few shares of stock in this magazine which we will sell for almost nothing. We do this because we want the public interested with us in the grand work of uplifting the nation.—*Life.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Reciprocity with Canada

At last, the bill to enforce the agreement for tariff reciprocity with Canada has been passed by the Congress of the United States, and passed without any of those amendments that were offered and pressed by legislators whose purpose was to kill it. The adoption of any one of these suggested additions would have been fatal. All were rejected in the Senate last week by majorities of about four to one, majorities including many who would vote for them if they should be brought forward as distinct and separate propositions, but who clearly perceived the insincerity, selfish motives and sinister designs of their advocates. The work on this side of the boundary is done. There have been obstruction and delay at Ottawa as well as at Washington, and Canada's Parliament has not yet been permitted to vote upon the agreement. It is known that if final action should be taken it would be favorable. But obstruction may compel the Government to lay the issue before the people at a new election. The result of such a test can be predicted with confidence, for we believe the agreement has commended itself to a large majority of Canada's voters.

Here the most formidable opposition has been that of agriculturists who were misled. Advocates of unjust and excessive protection assured them that they would suffer greatly by the removal of the present duties on grain and other farm products imported from Canada. These false teachers were aided in hidden ways by the agents of lumber and paper trade combinations that were enabled by other duties to extort high prices from the American people. They were also greatly assisted by insurgent Senators who had repeatedly in public addresses argued in favor of reciprocity and had, in the tariff debate of 1909, asserted that the duties on grain and other farm products were ineffective. The evidence of their inconsistency has recently been held up before the people. Their purpose was to prevent confirmation of the agreement because it was the work of a President whom they disliked.

We do not believe our farmers will be hurt by this reciprocity. In our judgment the entire country and the American people as a whole will be benefited by it. Assuming that the selling prices of our farm products would be reduced, these Senators have urged that compensation should be given to the farmers by amendments providing for the free admission of Canadian manufactured goods. If it were true that in justice they should have compensation in a reduction of the prices of manufactures, it could not be obtained in that way. Compared with our own, Canada's manufactures are small and weak. They have been created and sustained by the protection of tariffs or the stimulation of bounties. Free trade with the United States in manufactures would crush them out of existence. Could our farmers gain anything then by imports of manufactures from Canada? If they ought to have compensation, with respect to manufactures, for this reciprocal removal of duties on farm products—which we do not admit—they can obtain it only by downward tariff revision af-

ticing imports of manufactures from all parts of the world.

The full economic effect of this reciprocity cannot be exactly measured. Probably it will not perceptibly reduce the cost of living in our country. It will tend, however, to prevent an increase of the cost, to steady prices of food, to make the cornering of supplies more difficult, to restrain the greed of certain combinations, to promote conservation of our forests, and to aid the people of both countries when a crop is short on one side of the boundary and abundant on the other. The need of such equalization of differing harvests is shown at the present time with respect to hay. We have only two-thirds of a normal crop; Canada's crop is notably fine and heavy. And so at Chicago they are already using hay imported from Canada. But they must pay the tariff duty of $4 a ton. There should be no such duty.

The greatest benefit to be enjoyed by the inhabitants of both countries will be derived from the removal of many of the irritating trade barriers, 3,000 miles long, which have excited more or less ill-feeling between two peoples so closely resembling each other in intelligence, standards and aims.

To Mr. Taft must be given credit not only for making the agreement but also for effectively promoting the approval of it by the people and by Congress in his public addresses. Whether he sought thus to break the malign political force of the Payne-Aldrich tariff revision blunder, or was guided only by the principles of broad statesmanship, he should have been followed and supported by his party. There should have been a Republican majority for the bill in the Republican House, and the Republican majority in the Senate should have passed it before March 4. Then this tiresome special session would have been avoided. But the number of Republicans who have voted against it, in the Senate as well as in the House, exceeds the number counted on the other side, and so a majority have exprest their disapproval of the most memorable achievement of the President whom their party elected. This is a political blunder that deserves to be classed with the Payne-Aldrich revision.

## America's Interest in the Morocco Question

SINCE the European press, especially of London and Paris, continues to refer to the United States as deeply concerned over the Morocco situation and likely to take an active part in the settlement of the difficulties, it is well to consider in how far our interests are involved. Theoretically the United States, as signatory to the Act of Algeciras, has as much to say about it as any of the Powers; practically it seems to us that there is no sufficient reason why the United States should interpose in the negotiations now going on. In 1906, when, to adopt the amusing phraseology of the Act, His Majesty the Sultan of Morocco invited, in the name of the omnipotent God, the rulers of the world to counsel together and advise him how to reform his administration while maintaining his sovereignty and independence, the integrity of his state and economic liberty, the President of the United States was one of the invited advisers, for our country had taken part in the previous conference over Moroccan affairs in 1880. But in signing the convention, our representatives, Henry White and Samuel R. Gummere, appended a stipulation similar to that used at The Hague, to the effect that the United States did not thereby depart from its traditional policy of non-interference in European affairs and assumed no responsibility for the enforcement of the provisions of the agreement.

Our representatives were instructed at the start to look out for two things: that equal commercial privileges were insured to all nations and that the Jews in Morocco received proper protection. In the Senate the question was brought up by Senator Bacon, of Georgia, who opposed any participation in the conference. Senator Spooner, in defending the Administration, replied that the American delegates were not to vote on any question, but merely to attend in order to see that the interests of the United States were not neglected. It was generally assumed at the time that Senator Spooner made this statement on authority of the President, but this apparently was not correct, for the Amer-

ican delegates, or, rather, President Roosevelt himself, took a very active and on the whole salutary part in the proceedings. For indeed the sixty-four distinguished gentlemen who spent the first three months of the year in the hotel of the sleepy old Spanish city had little to do except to make formal motions and register protests, for the real negotiations were carried on directly between the capitals. President Roosevelt ignored all intermediary ministers and exchanged telegrams directly with Kaiser Wilhelm at critical moments, both before and during the conference, tho, as to the number, dates and tenor of these telegrams there was much discussion in the German and French press in the spring of 1907. According to Andre Tardieu, whose large volume on "La Conférence d'Algesiras" is the best authority we have, the active support given to France by Mr. Roosevelt was one of the determining factors in the defeat which Germany suffered at the conference. At times, however, his assistance was embarrassing to France, as when he urged that all of the ports should be policed by a mixed French and Spanish force, on the ground that a division of the ports between different Powers would tend toward the partition of Morocco. This would have interfered decidedly with the French plans, particularly in regard to Casablanca, which has since become practically a French port.

It is reasonable to suppose that M. Tardieu, in interpreting the motives of President Roosevelt, exaggerated his antagonism to Germany and the apprehension felt by our Government over the German imperialistic policy. The question, however, was raised in the United States Senate at the time whether the acquisition by Germany of Casablanca or some other Moroccan port would not, in view of German colonization in Brazil, imperil the Monroe Doctrine. The question naturally arises again, now when Germany holds the harbor of Agadir, a better port than Casablanca and still nearer the Brazilian coast. But to extend the Monroe Doctrine to the other shore of the Atlantic would be going too far, and, as to the alleged danger to the security of the Panama Canal, how could we object to Germany at Agadir and not to France at Casablanca, Spain at Larache and Great Britain at Gibraltar? Our commerce with Morocco is now inconsiderable—about a third of 1 per cent. of the total imports—but if that country is "Europeanized" by whatever nation or nations, it will doubtless increase our trade so long as we can have a fair chance at it, The French occupation of Algeria and Tunis has been of great commercial benefit to us. Our humanitarian sympathies are in no way involved in the fate of Morocco, as they were in the partition of Poland and the oppression of the Armenians. The people of Morocco will never be any more divided than they are now, nor be under a government more useless and unjust than the present.

There is only one factor in the problem with which we are directly concerned, and that is Liberia. As a colony of American negroes, founded by Americans under the auspices of the Government, it has always been under our protection and we cannot consent to having it made a pawn in the diplomatic game now going on. It is repeatedly referred to in the current discussions as having been given to Germany by France, or to France by England, or otherwise thrown in as boot in some territorial trade. It has been elbowed by its neighbors on all sides, until it was nearly crushed out of existence, and its troubles are not yet over. The last number of the *Liberian Register* is full of complaints of French aggression. The boundary commission of 1907, in spite of the protests of the Liberian Government, fixed the boundary line on "the right bank of the Cavalla River until the sea," instead of mid-channel, as is customary. It was understood that the Liberians were to have the servitude of free navigation of the river, but instead the French have shut out their boats so they have no access by water to the hinterland of their own country. But now that the United States has recently reasserted its protectorate over Liberia by sending a commission to arrange its difficulties it ought to be understood by the European Powers that they must leave it out of consideration in their diplomatic deals.

Apart from this, however, we have assumed no obligations and possess no in-

treaty that involve us in the Moroccan question. President Taft is more of a "stay at home body" than his predecessor, and it is probable that he will avoid participation in the negotiations as far as he can. His efforts for peace take the form of securing new arbitration treaties rather than acting as arbitrator. We are glad that in the crisis of 1906 President Roosevelt was able to do something toward bringing the European Powers to an acceptable compromise, but nothing in that action obligates us to renew our active interposition at the present time. Consequently we venture to question the very positive statement of the *Echo de Paris* that the United States has notified Germany that the establishment of a German naval base on the Moroccan coast would be calculated to compromise American interests to a serious extent; that the American Government would regard this as dangerous to the security of the Panama Canal and a direct menace; and that therefore the American Government has adopted the British point of view and is prepared to support it in concert with the British Government.

## Attorney-General Wickersham as a Socialist

It was a long step towards Socialism that Attorney-General Wickersham took in his address to the Minnesota State Bar Association. He made the startling suggestion—he did not absolutely approve it, but he looked favorably upon it—that the time might be near when our Government will fix the prices of all commodities distributed by interstate commerce, the price of which is set not by competition but by combinations of capital that control production. He said, and he said truly, that the era of competition is passing, or past, and with it must go the political economy based on competition, and why not the legislation based on the old political economy?

The number of products of manufacture which are now made under trust control has come to be enormous. The escape from competition, and the substitution for it of co-operation, is a phenomenon of the last few years. In his testimony before the congressional committee investigating the Sugar Trust Mr. John E. Parsons, who was counsel for the Havemeyers, declared that it was in 1887 that he organized the competing sugar companies into the Sugar Refiners' Company, for the purpose of eliminating competition. It was the beginning of that successful phase of the holding trust, even anterior to the Standard Oil combination. So new, so late is the appearance of practical monopoly, and the disappearance of competition.

And combination cannot be prevented by any legislation. It has come to stay. It is a necessity of advancing civilization. Competition is industrial war, and is wasteful like the wars of nations. Laws may be passed forbidding a holding company, or that one company shall own another, or that companies shall pool their products or agree on prices, or parcel out the territory they control, but there are other ways to do the trick and always will be, the easiest being the ownership of stock in two or more companies by the same persons or interests. Economy requires combination, but it gives power which needs to be held under restraint.

There always was sporadic and temporary local monopoly, but now we have it permanent and covering the country or the world. Was the price of steel fixt at the late conference of American and European manufacturers? They say no, but they admit what the public will suspect to be the same thing. In the old times there were very drastic laws against monopoly, and governments set the price of wheat as against the wheat-sharks. We have been taught that this was bad political economy, but it was necessary for the saving of human life endangered by starvation, for man is more than money. But now one Attorney-General reminds us that where there is no competition the Government may have to step in and fix prices to prevent robbery of the people by those who hold the full supply of what the people must have.

We say that the proposition approaches socialism, but we do not mean thereby to condemn it. The Post Office is in the line with socialism, an immense business carried on by the Government, and others forbidden to compete. The public school is socialistic, and so are the

public highways that have supplanted the toll roads. The ownership and operation of the canals and railways in Europe and Japan is a step toward socialism. There is much to be said for public ownership of railways as well as of other roads by the nation, and Mr. Bryan has urged that they be owned by the States thru which they pass, an obvious absurdity which he has not repeated of late years. Postal banks are socialistic and were opposed as such by private banks. Equally what we all want, the postal telegraph and the postal carriage of express matter is socialistic. We ned not fear the word, for we all want a measure of it, altho we may be afraid of the word, which sounds fearsome to many.

What Mr. Wickersham anticipates is that with the passing of competition in the manufacture of no matter how many products, the Government will have to control by a commission and to fix the prices. This is what has already been done with the railroads, because in the nature of the case competition is usually impossible. The Government, thru its commission, approves or disapproves or fixes rates. What is done for a non-competing railroad may be done also, he suggests, for sugar, or oil, or steel, or tobacco, or wood pulp, or beef. Why not?

To be sure, the Government does not own the railroads, and still would not own the manufacturing plants. But what is ownership? When a man, or a company, loses partial control of what he holds, has he not lost ownership in part? Is not the right of control a large part, and the only valuable part, in the ownership of an object? When the Government takes on itself the right to control the price of anything sold, such as a railway ticket or a gallon of oil, then the Government has assumed to that extent the rights of ownership. The fixing of price is a right of ownership, and when our Government shall assume the right to fix the price at which the manufacturer shall sell oil or steel it will be tantamount to its becoming part owner; and full ownership would be socialism, an end toward which we have been fast approaching in these last years, and the trusts which have been consolidating ownership and control have been a chief factor in the steady growth of socialistic policy.

Be it observed that what we have said above has no relation to the Socialist party or parties. That is another matter.

## Molded Lace

Good news comes to us from Lyon, by the way of Consular Report No. 165. A machine has been invented for manufacturing net and lace, the liquid material being poured on one side of a roller and the fabric being reeled off on the other side. One factory is now producing a thousand yards a day, and the process seems capable of indefinite extension and application to various sorts of woven, knit and reticulated goods. The raw material is cotton waste and the finished fabric is a good substitute for silk. As in the process of making artificial silk the cellulose is dissolved in a cupro-ammoniacal solution, but instead of being forced out thru minute openings to form threads, as in that process, the paste is allowed to flow upon a revolving cylinder which is engraved with the pattern of the desired textile. A scraper removes the excess and the turning of the cylinder brings the paste in the engraved lines down into a bath which solidifies it.

Tulle or net is now what is chiefly being turned out, but the engraved design may be as elaborate and artistic as desired, and various materials can be used. Since the threads wherever they cross are united, the fabric is naturally stronger than the ordinary. It is all of a piece and not composed of parts. In short, we seem to be on the eve of a revolution in textiles that is the same as that taking place in building materials. Our concrete structures, however great, are all one stone. They are not built up out of blocks, but cast as a whole. The reliefs and statuary which we are beginning to use freely on our buildings are not carved by the chisel of workmen, but are molded as clay by the artist's own hand. This opens a new field of art, monolithic statuary of unlimited size. The big Indian which Lorado Taft has just erected on the promontory overlooking Rock River, Ill., was made by pouring, instead of chipping, and five hundred barrels of cement were used in its construction

Lace has always been the aristocrat among textiles. It has maintained its exclusiveness hitherto by being based upon hand labor. In no other way could one get so much painful, patient toil put into such a light and portable form. A filmy thing twined about a neck or dropping from a wrist represented years of work by poor peasant girls or pallid, unpaid nuns. A visit to a lace factory, even to the public rooms where the worn-out women were not to be seen, is enough to make one resolve never again to purchase any such thing made by hand. But our good resolutions do not last long and in time we forget the strained eyes and bowed backs, or, what is worse, value our bit of lace all the more because it means that some poor woman has put her life and health into it, netting and weaving, purling and knotting, twining and twisting, throwing and drawing, thread by thread, day after day, until her eyes can no longer see and her fingers have become stiffened.

But man is not naturally cruel. He does not really enjoy being a slave driver, either of human or animal slaves, altho he can be hardened to it with shocking ease if there seems no other way of getting what he wants. So he usually welcomes that Great Liberator, the Machine. One reason for the popularity of the automobile is because the pleasure of swift motion is unalloyed by the sight of horses being whipped to speed and jerked about by the jaws. Then, as we pass the field of grain, how our hearts rejoice to see the farmer riding triumphant on his scythe-armed chariot over the land where his father wielded the cradle with his aching arms. The open door of a power house on the street always attracts a group of passers-by, and no wonder. It is an inspiring sight, a glimpse into a Utopia, a vision of ideal labor condition; this clean, spacious room, quiet save for the whirring of the flywheel or the purring of the dynamos; the engineer sitting reading a paper and getting up occasionally to look at a dial, take off a chart, record a reading, use an oil can or turn a stop-cock. This is what has replaced the treadmill and the galley slave, the straining and tugging of hundreds of thousands of horses.

The Machine is not only the Great Liberator, it is the Great Leveler also. It is the most powerful of the forces for democracy. An aristocracy can hardly be maintained except by distinction in dress, and distinction in dress can only be maintained by sumptuary laws or costliness. Sumptuary laws are unconstitutional in this country, hence the stress laid upon costliness. But machinery tends to bring styles and fabrics within the reach of all. The shopgirl is almost as well dressed on the street as her rich customer. The man who buys ready-made clothing is only a few weeks behind the vanguard of the fashion. There is often no difference perceptible to the ordinary eye between cheap and high-priced clothing once the price tag is off. Jewels as a portable form of concentrated costliness have been in favor from the earliest ages, but now they are losing their factitious value thru the advance of invention. Rubies of unprecedented size, not imitation, but genuine rubies, can now be manufactured at reasonable rates. And now we may hope that lace may soon be within the reach of all, not merely lace of the established forms, but new and more varied and intricate and beautiful designs, such as the imagination has been able to conceive, but the hand cannot execute.

## The Human Element

The scientific journals are again discussing the relative importance of the material and the human element as factors in the causes of fatal disasters. According to an official statement issued by the New York & New Haven Railroad Company, the recent accident at Bridgeport, in which fourteen persons were killed and fifty or more were injured, was the fault of a negligent engineer. At the point where the accident occurred express trains switch over from an inside to an outside track, for the purpose of drawing up, whenever stops are made, at the passenger platforms of the Bridgeport station. Engineers are under orders to slow down at this crossover to fifteen miles an hour. The derailed train took the switch at sixty miles an hour, running by danger signals as well as ignoring regulations.

The engineer was found among the dead, and we can only guess what ailed him. He may have been merely reckless—some engineers are—or the strain of a heavy day's work and the severe heat, from which we all were suffering at that time, may have unfitted him for his duties. But, however that may be, the public cannot accept the easy-going shifting of responsibility, to which railroad companies are notoriously prone under these circumstances, and we congratulate our valued contemporary, *The Scientific American*, on the intelligent and candid discussion in which it points out that this human element of uncertainty can and ought to be eliminated from railway operations.

For many years the most important progress that has been made in railway operations so far as it concerns the safety of the traveling public has consisted in the substitution of unerring physical arrangements and mechanisms for human perception, memory, judgment and fidelity. No human being can possibly attain to that inerrancy of action which characterizes inanimate mechanism when it is properly designed, properly made and kept in repair. Automatic signals, automatic shut-offs and brake-setting devices, automatic couplings, and so on, daily preclude scores of accidents of all degrees of seriousness that would inevitably happen if our sole dependence were on the human brain, however conscientious the will and intelligent the mind dwelling within it.

The cross-over problem, as *The Scientific American* points out, is perfectly simple from the engineer's standpoint, and has already been solved in practice by at least one of the principal railroads. It is only necessary to take a longer distance for the cross-over track, so that the angle of deflection from the axis of the rails on which the train has approached shall be extremely small. It can be made so small that the heaviest locomotives can safely take the shunt at any speed—sixty miles or more—at the will of the signal man or the engineer. Regulations and the physical or mental condition of the engine driver then cease to be important so far as the occasion is concerned.

There are other problems of the operation of railways, steamships, mills and factories, which, in like manner, will ultimately find their perfect solution only in correct construction and adequate mechanism. The human element can be reduced to smaller and smaller proportions. It cannot, however, be entirely eliminated, and operating companies must therefore be held to responsibility, not only for substituting good engineering for fallible human instruments, wherever that is possible, but also for minimizing to the utmost the conditions which make the human instrument now and then momentarily lose self-control or commit fatal mistakes.

Something has already been done by State legislation here and there to prohibit that unpardonable overworking of men under intense strains which is always a factor of extreme danger. Such prohibitions should be made far more drastic and comprehensive. The ways and means to prevent heartrending disasters are perfectly well known to scientific men—to engineers, physiologists and psychologists. We fail to employ them because we are far too easy-going in our attitude toward that insatiable cupidity which places the dollar above human life, particularly when it is some other fellow's life that is at stake.

**500 Peers Wanted**

H. H. Asquith, No. 10 Downing St., London, England, is understood to be in the market bidding for material suitable for making peers, delivered in lots of 50 or 100 as needed. Here is an exceptional opportunity for American capitalists and we are surprised that attention has not been called to it in the *Daily Consular and Trade Reports*. Hitherto their only chance to obtain an entree into the British aristocracy has been thru their daughters and the customs of England unfortunately differ from those of China in that ennoblement does not confer nobility upon the ancestors of the favored individual. Altho it is doubtless gratifying to see coronets upon the heads of one's daughter and grandchild, it cannot be the same as feeling it upon one's own head. It is besides decidedly annoying to a self-made man to have to take a back seat at

THE WESTWARD MOVEMENT OF THE CENTER OF POPULATION 1790-1910

a banquet or to be excluded from a coronation while the lord he has bought for a son-in-law goes in free. A contribution to the barrel of the Liberal party of half the amount usually required by a foreign nobleman before he will consent to marry an American girl, might now obtain the coveted title and the other half could be invested in a country estate with ancestral tombs, armorial bearings, hunting privileges, and other necessary appurtenances. The minimum amount paid in to the party funds by a new peer is $25,000, and Americans would of course pay more, as they do for everything in London. By taking Americans to fill up the House of Lords Premier Asquith would avoid local jealousies and the depletion of the House of Commons. He would also strengthen the amicable relations now existing between this country and England, for we on this side of the water would be much pleased to be relieved of those of our citizens who aspire to coronets.

**The Center of Population**

Westward the star of empire takes its way, following along the 39th parallel of latitude with only slight deviations to the north and south. In the last ten years it has moved almost straight west and more than twice as fast as in the previous decade. In 1900 it was 6 miles southeast of Columbus, Ind. Its new position, as located by the census of 1910, is less than a mile north of this point and 31 miles west of it, being now 4¼ miles south of Unionville, Monroe County, Ind., or, to put it in more geographical language, latitude 39 degrees 10 minutes and 12 seconds north and longitude 86 degrees 23 minutes and 24 seconds west. The center of population is far from being the most populated center. In fact, when the party of surveyors went to drive a stake at the exact point, they found it in a gully of a thick wood near Salt Creek, reached by no road, and a rattlesnake was the only inhabitant interested in their proceedings. What is meant by the center of population may be made clear by a crude illustration. If we cut a map of the United States out of a broad board we will find that it can be balanced on a point in Kansas, the geographical center. But if we make the board thin enough, and stick into it 93,402,151 pins in the proper places, one for every man, woman and child, we will find that it balances on the pivot of the center of population. Or in other words, the center of population is where the capital should be if we were anxious to keep down the mileage fees of the members of Congress to the lowest possible figure. Obviously a man in California teeters down the board more than a man in Illinois. One reason why the center of population has taken such a long jump this time is because of the rapid growth of the Pacific States. The mean center, represented for former years on the accompanying map by triangles instead of stars, is a different point, moving more slowly westward. Just as many people are to the north of this mean center as there are to the south of it, and just as many to the east as to the west, regardless of their distance away from this point.

**The Injury of Hot Weather**

A hot wave means something serious enough to those who live in large cities. So far the mass of the people are helpless victims, and if life is not lost, still life is hardly worth enduring. It

does not follow by any means that going to the country relieves one from the torrid temperature. From some of the orchards in Western New York apples were gathered that had been literally baked on the trees. Thousands of bushels of fruit were loosened on the stem and fell to the ground. The oat crop and the corn crop over a dozen States have been so badly damaged that all estimates of the year's production have to be reviewed. The farmer and his crops scarcely escape the destruction of zero weather before they are plunged into these scalding periods, which are even more unaccountable and the effect of which is less preventable. The prices of food stuffs move up accordingly; and the problem is a plain one: Are we, with all our inventions and discoveries, to remain the victims of climate? Undoubtedly a great deal more can be done than has been undertaken as yet to modify climatic conditions, by a judicious preservation of shade trees and the use of large electric fans in orchards, run by brooks. A municipal cooling system is a simpler affair, and is pronounced by experts not only possible but economical. At least half a million dollars is knocked out of the efficiency of New York City whenever the thermometer climbs over 90 degrees. This would make the loss from heat for a single month at least twenty-five millions of dollars, and this would more than pay for a system that would supply cool air thruout the city. These problems are in the incubating state, but are sure to be solved.

**Cultivated Rubber**

Within the last ten years a new plant of the highest value to modern civilization has been captured from the jungle and domesticated. The credit of it and, by unusual luck, the profit of it also, goes to Great Britain. While the Brazilians were bleeding rubber trees to death, the Governments of British Malaya and Ceylon were planting them. Now, killing a rubber tree to get its latex is as foolish as killing a cow to get its milk. The rubber gatherers had to go deeper and deeper into the forests of Para in search of new trees, and at the same time the demand for rubber was increasing rapidly, chiefly owing to its use for carriage and automobile tires, which now uses up half the world's product. But the botanists of Kew Garden in London had for many years been working in co-operation with the colonial botanists in the effort to acclimate the *Hevea brasiliensis,* and they succeeded in demonstrating its practicability in time to keep the price of rubber from soaring quite out of sight. As soon as it was shown that a product then selling at twelve shillings a pound could be raised for one, the Malayan planters rooted up their coffee trees to put in rubber. Other tropical colonists with more or less promptness followed their example. To be sure, there are now more rubber plantations on paper than there are on land, but already the cultivated product amounts to more than the wild. There are now about 120,000,000 rubber trees on the plantations, practically all grown within the twentieth century. The value of the rubber raised in the Malay Straits and Straits Settlements now amounts to over $30,000,000 a year. Next comes Ceylon, with an annual production nearly half as great. There is plenty of land capable of raising Para rubber in the Philippines and in Panama, while within the borders of the Unite States proper the Guayule plant can be cultivated. This is a hairy shrub growing upon the arid plateaus of Texas, New Mexico and Arizona, as well as Northern Mexico, and yielding a form of rubber useful for many commercial purposes. But here the same wasteful policy has been pursued as in Brazil. The plants have been pulled up instead of being cut, consequently it is already extinct in some places.

**Presbyterian Union in Scotland**

It is but a few years since in Scotland the United Church and the Free Church joined in forming the United Free Church; and so soon there is a hopeful plan to unite this strong and enthusiastic body with the Established Church of Scotland. That would seem impossible unless the Kirk should give up its privilege of establishment. Committees of the two churches are at work on the plan of union, which provides for a "declaration of spiritual freedom en

bodied in the constitution of the reunited Church, in such comprehensive terms as would include all matters spiritual," thus "free from all external authority other than that authority in all matters secular from which no institutions or individuals could exempt themselves." It is proposed that Parliament should acknowledge such new constitution. In such a union care would be taken to preserve the historical continuity of the Church from its ancient organization; and the union would make it the actual as well as nominal Church of Scotland, responsible for the religious instruction of the people. Of course, there would be left some Anglicans, Baptists, Wesleyans and Congregationalists, but the overwhelming majority would belong to the Church of Scotland, and the religious condition would approach the ideal.

Mayor Harrison's new appointments to the Chicago Board of Education and Library Board are as follows: David M. Pfaelzer, representing the Jewish population of the South Side; Harry A. Lipsy, representing the Jewish population of the West Side; John C. Harding, representing the English; Mrs. John MacMahon, representing the Irish; Charles O. Sethness, representing the Norwegians; James B. Dibelka, representing the Bohemians; Henry W. Huttman, representing the Germans; Max Hemus, representing the Danes, and Phillip M. Ksycki, representing the Poles. In announcing the appointments the Mayor declares that he has satisfied all of the many races that make up Chicago's population. It seems to us that he has forgotten one, but this is quite natural for the Americans constitute such a small and uninfluential component of the population that they are hardly entitled a representative among the new members of these Boards.

The Rome correspondent of *The Western Watchman* reports a full interview with Abbot Gasquet, head of the Papal Biblical Commission revising the text of the Vulgate. We observe this important statement attributed to Abbot Gasquet:

"Given the same proportion of work which the Commission has accomplished in the past continues to be maintained in time to come, the text shall be finished in about five years. Where this is done it may be the lot of another commission to test the accuracy of St Jerome himself."

That last intimation is important and unexpected. It implies that Jerome's Vulgate, which the Roman Church has depended upon, may be corrected on the basis of the original Hebrew and Greek, thus reducing the Latin from its position of authority.

In a postal card primary conducted by *The World's Work* 1,505 replies were received from the readers of that magazine, representing all the States in proportion to their representation in the electoral college. The number of votes received for the leading candidates for presidential nomination next year was as follows: Wilson, 519; Taft, 402; Roosevelt, 274; Harmon, 96; La Follette, 91; Clark, 45; Bryan, 34. The most striking feature of the canvass was that 145 of the votes cast for Governor Wilson came from former Republicans.

When the Rev. Anna Shaw was in Stockholm at the International Suffrage Convention the Norwegian Government refused to allow her to occupy the pulpit. In Norway women are allowed to vote but not to preach. In most of the American States women are allowed to preach but not to vote. The inconsistency is perhaps only apparent, however, as the men in each country reserve to themselves what they consider most worth doing.

The Chicago City Council is undecided whether to require all the milk sold in the city to be pasteurized or to prohibit the sale of pasteurized milk altogether. Since this is a case where doctors disagree why not take advantage of the opportunity to let the people have a choice in the matter so long as they know what they are buying. Such opportunities are getting rare nowadays.

The French papers nowadays are loud in their complaint that the extortionate demands of the labor unions are raising the cost of living to an unendurable hight. The latest outrage of this kind reported is that the barbers of Paris have raised the price of a hair cut to 8 cents.

## Protection Against Fire

A RECENT report of a United States consul indicates that our cities are far behind Europe in protection against fire. During 1907 the loss by fire in the United States was $215,084,709, a per capita loss of $2.54. The expense of fire protection was $241,401,442, which may be itemized as follows: Excess of premiums over insurance paid by companies, $145,604,362; annual expense of waterworks chargeable to fire service, $28,856,235; annual expense of fire departments, $48,940,845; annual expense of private fire protection, $18,000,000. This annual outlay for fire protection amounts to $2.82 per capita, the total loss and outlay for the year being $5.36 per capita.

A table has been prepared from Government statistics showing the per capita fire loss in 1907 in American and European cities, classified according to population. The figures show a notably greater fire loss in this country:

| Population. | U. S. | Europe. |
|---|---|---|
| Over 300,000 | $2.24 | $0.65 |
| 100,000 to 300,000 | 2.14 | 0.37 |
| 50,000 to 100,000 | 2.47 | 1.67 |
| 30,000 to 50,000 | 3.28 | 0.72 |
| 10,000 to 30,000 | 2.37 | 0.81 |
| Under 10,000 | 3.47 | .... |

The average annual losses of six nations in Europe, per capita, were compiled from records of varying years and the years grouped with this result: Austria, $0.29; Denmark, $0.26; France, $0.30; Germany, $0.49; Italy, $0.12; Switzerland, $0.30.

The aggregate loss from fires in Paris in 1908 was $1,390,413. The cost of the fire department, consisting of 1,803 officers and men, was about $0.24 per capita. The salaries of the force amounted to $469,560. The average cost per capita in Berlin for the maintenance of the department was $0.30, the actual cost of the department in 1910 being $609,814.

These figures are illuminating and are well worth the careful study of our city governments. When our people and legislators awake to the fact that it is possible to reduce our enormous fire waste by proper precautions, we may hope for a better showing in comparing our annual fire loss with that of European countries.

IN a recent bulletin issued by the Postal Life Insurance Company, it is announced that the Health Bureau, established by the Provident Savings Life, will be continued. This provides, among other features, for a free medical examination of policyholders once a year. The bulletin speaks of the evil effects of alcohol, the dangers of pneumonia, and then devotes a large amount of space to the importance of the proper care of the eyes. Ill-health, ascribed to other causes, is often due to improper glasses or other forms of eye strain. An examination by a competent physician will avoid many nervous disorders.

GOVERNOR MCGOVERN, of Wisconsin, has signed a bill authorizing that State to engage in the annuity and life insurance business after next year. The business is to be carried on under the management of the State Insurance Commissioner, and is to be conducted on the same lines as a mutual insurance corporation, but at a minimum expense of not to exceed $2 per $1,000 insurance. Premiums are to be calculated according to the American mortality table. Annuities are to range from $100 to $300, and life insurance policies from $500 to $3,000.

THE fire insurance companies have no love for fireworks. Now in addition to the discouraging city ordinances in New York, the fireworks companies have greatly injured their own cause by wholesale frauds in arranging Fourth of July displays. In some cases the city was charged ten times more than the regular price.

AT a special meeting of the Aetna Insurance Company of Hartford the legislative amendment to its charter, permitting the increase of its capital from $5,000,000 to $10,000,000, was accepted. The increase will probably not be made for the present.

# Financial

## The Year's Foreign Trade

In the last fiscal year our exports made a new high record, rising to $2,048,691,392, and exceeding those of 1907, the previous record year, by nearly $108,000,000. The gain over the exports of 1910, amounting to $303,700,000, or 17.3 per cent., was the largest increase ever shown. Imports were less by about $29,000,000, or 1.8 per cent., than those of 1910. The sum of both the incoming and outgoing trade, $3,576,070,000, exceeded that of 1910 by $275,000,000, and that of the highest preceding year, 1907, by $261,000,000. The excess of exports over imports, $520,706,304, was greater than that of 1910 by $332,000,000, and had been surpassed only in 1908, 1901, 1900, 1899 and 1898. Figures for the last sixteen years are given below:

| Year. | Exports. | Imports. | Excess of exports |
|---|---|---|---|
| 1911 | $2,048,691,392 | $1,527,985,088 | $520,706,304 |
| 1910 | 1,744,984,720 | 1,556,943,430 | 188,037,290 |
| 1909 | 1,663,011,104 | 1,311,920,224 | 351,090,880 |
| 1908 | 1,860,773,346 | 1,194,341,792 | 666,431,554 |
| 1907 | 1,880,851,078 | 1,434,421,425 | 446,429,653 |
| 1906 | 1,743,864,500 | 1,226,562,446 | 517,308,054 |
| 1905 | 1,518,561,666 | 1,117,513,071 | 401,048,595 |
| 1904 | 1,400,827,271 | 991,087,371 | 469,739,900 |
| 1903 | 1,420,141,679 | 1,025,719,237 | 394,422,422 |
| 1902 | 1,381,719,401 | 903,320,948 | 478,398,453 |
| 1901 | 1,487,764,991 | 823,172,165 | 664,592,826 |
| 1900 | 1,394,483,982 | 849,941,184 | 544,541,898 |
| 1899 | 1,227,023,302 | 697,148,489 | 529,874,813 |
| 1898 | 1,231,482,330 | 616,049,654 | 615,432,676 |
| 1897 | 1,056,993,356 | 764,730,412 | 296,263,144 |
| 1896 | 882,606,938 | 779,724,674 | 102,882,264 |

It is noticeable that there was an excess of gold imports amounting to $51,000,000, against excesses of exports in the two preceding years, $75,000,000 in 1910, and $47,000,000 in 1909. Exports of breadstuffs have declined steadily, falling from $205,000,000 in 1908 to $111,000,000 last year. In the same period meats and dairy products have been reduced from $170,000,000 to $125,000,000. The gain has been due mainly to cotton and manufactures. Cotton exports last year rose to $584,000,000, the highest value ever known, exceeding that of the previous record year, 1907, by $103,000,000. The quantity exported in that year, however, was greater by 10 per cent. But the average price was only about 10½ cents a pound, against 14½ in 1911. Free imports last year, $778,000,000, were a larger share, 50.92 per cent., of the total than had been shown before in sixteen years. Dutiable imports, nearly $750,000,000, were less by $51,000,000 than in 1910, but more than in any other preceding year, 1907 excepted.

## Canada's Crops

MANITOBA'S Minister of Public Works says the Province needs 20,000 harvest workers, as the crops beat all records. There is a great demand for harvesters thruout the three Provinces of Manitoba, Alberta and Saskatchewan, and the rail road companies are advertising for 50,000. In these Provinces the wheat area has been increased this year by 1,200,000 acres, or about 14 per cent., and from the time of seeding the weather has been almost continuously favorable. Further east an exceptionally heavy crop of hay is being harvested. In our own country the hay crop is only two-thirds of the normal quantity. Hay imported from Canada was sold in Chicago last week. The duties paid would not have been required if the reciprocity agreement had been in force.

....The National Monetary Commission will present its report to Congress on December 4, and will then cease to exist.

....The Transvaal's output of gold in June, £2,907,414, was but little below that of May, £2,913,734, which was the largest yet reported.

....Several rubber factories in New England, employing about 4,500 persons, were closed last week for a month, owing to lack of orders.

....The city of Winnipeg has decided to buy, for $15,000,000, the entire property of the Winnipeg Electric Railway Company, which includes a railway (with fourteen years of franchise remaining), a power plant and gas and electric light works.

VOL. LXXI NEW YORK, THURSDAY, AUGUST 3, 1911 No. 3270

## Survey of the World

**President Taft and Alaska**

We discuss editorially the attacks upon the President in connection with the so-called Controller Bay shore front. On Wednesday of last week Mr. Taft sent to the Senate a special message replying to the Poindexter resolution of June 27, which called for information regarding the elimination of this Alaskan water front from the Chuguch National Forest. In transmitting the information called for, and further data, the President turned the tables on his enemies, and unhesitatingly branded as "a wicked fabrication" the notorious "Dick to Dick" postscript to a letter which was addressed, it was said, by Richard S. Ryan, representing the Controller Bay Railway and Navigation Company, to the former Secretary of the Interior, Mr. Ballinger. The President said, in the course of his message:

"I am in full sympathy with the concern of reasonable and patriotic men that the valuable resources of Alaska should not be turned over to be exploited for the profit of greedy, absorbing, monopolistic corporations or syndicates. . . .

"On the other hand, the acrimony of spirit and the intense malice that have been engendered in respect of the administration of the government in Alaska and in the consideration of measures proposed for her relief, and the wanton recklessness and eagerness with which attempts have been made to besmirch the characters of high officials having to do with the Alaska government, and even of persons not in public life, present a condition that calls for condemnation and requires that the public be warned of the demoralization that has been produced by the hysterical [illegible] of good people and the unscrupulous and corrupt misrepresentations of the wicked."

**The Reciprocity Bill Signed**

Canadian reciprocity was created so far as the United States Government's part in the contract goes, when President Taft signed the bill approving the agreement, on Wednesday of last week. The free admission of pulp wood and print paper made from timber cut on Canadian lands in private ownership is provided for, and this part of the bill, requiring no action by the Canadian Parliament, goes into immediate effect. The President received congratulations from many individuals, James J. Hill's message being, in part, as follows: "Canadian reciprocity . . . will greatly benefit the whole country without injury to any part." The scene now shifts to Ottawa. The Government had a majority of 46 in a house of 221 members, but Parliament was dissolved on July 29. The Government expects to return with an increased majority, altho some seats in the French Province of Quebec are likely to be lost, owing to Nationalist opposition. Manufacturers also will support the Conservative Opposition, and it has even been reported that the lobbyists who were active in Washington during the reciprocity contest there will remove to the Dominion capital. The Opposition is making as much as possible out of the slogan "American dollars," just as the British Conservatives did in their late election. It is charged that the Liberal candidates are to receive contributions from American capitalists, especially the railway interests, and there are several minor Administration scandals out of which an effort at capital making is evident. Parliamentary nominations will be made September 14, and the election will follow a week later.

**Trust Cases**

Owing to the new interpretation of the Sherman act in the Standard Oil and Tobacco Trust decisions, a decision

of the Circuit Court of Appeals, awarding $25,300 damages to H. A. Thomsen, was set aside last week. Judge Noyes, who wrote the original opinion, also wrote the one which reversed it and ordered a new trial. The court had held originally, he said, that it was immaterial whether the restraint of trade was reasonable or unreasonable. Thomsen, a shipper, sued a combination of steamship companies engaged in trade with South Africa.——Forty-nine of the men indicted a few months ago for maintaining an unlawful combination in the wire industry entered pleas of *nolo contendere* (substantially equivalent to pleas of guilty) last week and were punished by fines amounting to $54,900. District Attorney Wise insisted that the punishment should be more severe. The combination was voluntarily dissolved about two years ago. Among the indicted were a son-in-law of J. Pierpont Morgan, Charles F. Brooker and the Roeblings, of Trenton, N. J.——It is announced that the so-called Electrical Trust, of which the General Electric Company and the Westinghouse Electric Company are members, and which the Government some time ago began to prosecute, is ready to go into dissolution, accepting a decree which will soon be issued. It is asserted, in fact, that the combination no longer exists, and that its death has caused a large reduction of prices.——As the result of an inquiry made by agents of the Government, evidence tending to show that the United Shoe Machinery Company violates the Sherman act will be laid before a grand jury in Boston.——During the Congressional investigation concerning the steel industry, last week, the chairman of the committee introduced a copy of a combination agreement, fixing the prices and apportioning the sales of steel plates. This combination was made in 1900 (before the formation of the Steel Corporation) and was dissolved two or three years later. Among the eleven companies that signed it were the Carnegie Steel Company, the Illinois Steel Company and Jones & Laughlin. According to the testimony of A. L. Lukens, president of an independent company, Judge Gary, head of the corporation, at the dinners given to representatives of the steel industry, has read lists of prices which the Corporation was to maintain, and other companies have tacitly agreed to accept them. A report against the International Harvester Company, submitted to Attorney-General Bonaparte in 1908 by an agent of the Department of Justice, was produced by the committee. It showed that the Corporation allowed a rebate of $3 per ton to the company on all steel purchased. Mr. Bonaparte will be asked to explain why he did not prosecute. It is said that there will soon be both criminal and civil suits against the company. Much additional testimony as to the purchase of the Tennessee Coal and Iron Company by the Corporation has been taken. Substantially it is to the effect that the brokers and banks that were carrying the stock of the pool, being in danger of failure during the panic, appealed to capitalists interested in the Corporation for such relief as could be given by purchase of the shares, and that the panic would have been more severe if this relief had been withheld.——The Government will appeal from the decision of the court in the case of the merger of the Harriman railroad companies, which were held to be not guilty.

**The Oil Split**

From the Standard Oil Company comes the formal announcement of the way in which that corporation applies the "rule of reason" as laid down by the Supreme Court of the United States, and reorganizes to meet the provisions of the Sherman Anti-Trust law. The stock of about thirty-five subsidiaries now held by the parent company will be distributed among the stockholders *pro rata*. The answer to the decision recites the names of the companies which the Trust controls and announces the dates for the opening and closing of the stock books in the New Jersey concern, which is the holding company, so that those interested may be on record when the distribution takes place about December 1.

**In New York**

After fourteen years' leadership of the Kings County, New York, Republican organization, Timothy L. Woodruff was forced out last week, and

is succeeded by Frederick J. H. Kracke, of Flatbush (Brooklyn). His retirement is regarded as a "progressive" triumph. ——The Democratic Governor of New York was active last week in the exercise of the veto power. On Friday, he took action on forty-four bills, of which he vetoed thirty-eight. On Thursday, he vetoed fourteen. The majority of the bills vetoed carried appropriations, the total amount of which fell just short of $1,000,000. Comparing his administration to date with last year, the fiscal year of the Hughes administration, Governor Dix has saved the State nearly $2,000,000, altho the Legislature has provided for a deficit of $1,500,000 left by the late administration, and has appropriated $1,650,000 to restore the Capitol, which was greatly damaged by the fire of last winter. Governor Dix was elected on a platform promising economy of administration.——It was announced that on Monday of this week the actual digging of New York's new subways would be begun at Sixty-seventh street and Lexington avenue.

**The Situation in Mexico**

Dispatches from Mexico last week reported but little disorder, if the lawless acts of the Magonists near the northern boundary be excepted. The Government was making no effort to punish or restrain these bandits. The most significant change in the situation is that which was shown by loss of popular respect for Madero and a rapid growth of public sentiment in favor of the candidacy of Gen. Bernardo Reyes. Cartoons decidedly unfavorable to Madero were published at the capital, even in *El Pais*, a revolutionist paper for which Madero interceded at about the time of the retirement of Diaz. It is understood that a quarrel has separated Madero and his brother Gustavo from the Gomez brothers. On the other hand, the friends of General Reyes are insisting that he shall be a candidate for the Presidency. Posters advocating his nomination are displayed in many cities, and he does not discountenance the movement. ——Juan Frias, a Liberal was elected Governor of Queretaro on the 23d, by a large majority, the Catholic party's candidate being third on the list. At a municipal election in Zapotlan (Jalisco) a few days earlier, however, the Catholic party had a majority of about six to one over the Liberals, who, after the polls were closed, caused a riot and destroyed the ballots.

**Hayti's Revolutionists**

It was expected, at the beginning of the present week, that the revolutionists in Hayti would soon capture the capital, which they had surrounded, and that President Antoine Simon would become a prisoner or an exile. He had been encouraged by a victory which his son Ulysses had won (on the 28th) at Aux Cayes, on the south coast, where the local leader of revolt, General Larrieux, was captured and shot, but it did not seem possible for him to resist the attack of 10,000 rebels, who were within a few miles of the capital. These troops are commanded by General Leconte, who expects to be made President, but there is another revolutionary faction which is led by Gen. Antenor Firmin, and there may be war between the two. At the end of last week there were four United States warships in Haytian waters. One of them, the scout cruiser "Chester," had made the voyage from Newport, 1,400 miles, in seventy-five hours. Another, the "Salem," was ordered to go from Norfolk. Germany sent a cruiser from Montreal. Great Britain decided to send no ship, evidently relying upon our Government. At last reports, foreign residents had not suffered, and the American engineers engaged in building a railroad had not been disturbed.——Reports by mail from Nicaragua say that Managua, the capital, is in a state of siege, that its jails are full of political prisoners loaded with chains, that these prisoners have been subjected to torture, and that the families of several have purchased their liberty by paying large sums to the authorities. On the 29th, three Liberal leaders were exiled.——Twenty-two feet of the water surrounding the wreck of the battleship "Maine" having been pumped out, much evidence of an initial explosion due to exterior force has been disclosed. Plates and ribs of the double botton were driven and bent upward 40 feet above their nor-

mud position. Parts of the keel were raised in the same way. Several months may be consumed in removing the mud in which the wreck is imbedded. The bones of sixteen bodies have been found. Congress is now asked to add $250,000 to the sum of $650,000 heretofore appropriated for the work. While the Government in Costa Rica is committed to the project of procuring a loan from an American syndicate headed by Minor S. Keith, many of the people oppose it. The local press attacks the project, saying that such a loan would be a step toward giving control of Central America to the United States.——Great loss was caused by the recent typhoon in the Philippines. Rains continued for thirteen days. At Baguio, the rainfall of one day was 39 inches, and 77 inches fell in four days. The loss in Luzon by storm and flood is $1,500,000.——It is expected that French bankers will invest $10,000,000 in an agricultural bank at Manila under the Government's guarantee of 4 per cent.

**South America**

Dr. Francisco Becerra, special fiscal agent of Colombia, arrived in New York last week and sailed for London, to complete negotiations there for a loan of $5,000,000. He explained that the overtures of American bankers had been rejected because of the controversy about Panama:

"Until justice is done to Colombia, Americans will be discriminated against simply because they are represented by the Government which dismembered Colombia and refuses to make amends. Americans as individuals are welcomed in Colombia; our people have ceased to hold them individually responsible since they came to understand that the seizure of Panama was the work of the Roosevelt administration. But Americans will be barred from obtaining concessions or having a hand in the development of our marvelously rich country until this wrong is righted. meantime Europeans are investing heavily in Colombia. We have entered on a new era of political stability and industrial prosperity. We are living in hope that the United States will see fit soon to remove the barrier to renewal of the friendship which so long marked the relations between our peoples. Arbitration of the Panama affair would accomplish this at once."

——Suddenly, on the 26th, the entire Venezuelan Cabinet resigned and new Ministers were appointed. The reasons for this change have not been published. No trace of Castro has been found, but it is said that he is in Nicaragua. Paraguay still fears that Colonel Jara, the dictator recently deposed, will organize a revolution against the present Government. In his recent message to Congress, President Leguia, of Peru, said:

"Our close and cordial relations with the United States are daily growing stronger, owing to the decisive influence of that great Republic in favor of peace on this continent."

He spoke of Peru's acceptance of the proposition for submission of her boundary dispute with Ecuador to the Hague tribunal, and of Ecuador's rejection of it. A joint commission has adjusted Peru's boundary controversy with Bolivia, and a *modus vivendi* with Colombia probably foreshadows a settlement with that country.

**The Veto Bill**

When Premier Asquith appeared before the House of Commons to announce that he had received the sanction of the King to the enforcement of the Government's policy he was greeted with a storm of jeers and yells which prevented his being heard. The long accumulated anger of a defeated and infuriated Opposition was exprest in disturbances such as have but rarely disgraced the British Parliament. Five times the Premier rose to speak and was howled down and for three quarters of an hour the uproar continued. The younger Unionists under the leadership of Lord Hugh Cecil kept up concerted shouts of "Traitor!" "Divide!" and "Redmond first!" The Speaker of the House was powerless to restore order and vainly begged the members to preserve the decencies of debate. When Mr. Asquith alluded to the late King the Unionists yelled "Who killed the King?" and "Keep the King out of it!" The speech which the Premier tried to make was afterward given to the press. In it he stated that the amendments added by the Lords amounted to a virtual rejection of the bill and could not be accepted. They replaced the machinery of the measure by expedients which were far worse than any of those originally proposed and

some of which were absolutely grotesque. Whenever there was a Unionist majority in Parliament, measures of the most vital importance might be passed in defiance of public opinion. He added:

"We cannot doubt that the advice which we have offered the Crown and which the Crown has accepted is warranted by constitutional principles. We do not desire that the prerogative shall be exercised. We trust that the necessity for its exercise may be avoided.

"There is nothing derogatory to the reputation of a great party and nothing humiliating to it in admitting that it has been defeated. No one asks them to accept the defeat as final. They have only to convince their fellow countrymen that they are right and that we are wrong and they can repeal our bills. Believing that the chances for a satisfactory solution of the issues at stake may thereby be improved, I do not propose today to ask the House to take any action in regard to the Lord's amendments to the bill, but to adjourn the debate."

Mr. Balfour, when he rose to reply, was not interrupted by the Ministerialists. He said that the bill was not one to deal with a deadlock between the houses; it altered the whole Constitution. It was a revolution. The Premier had apparently advised the Sovereign to make him an absolute dictator. The Premier, he said, had arrogated to himself powers which no republican dictator in the world possesses.——But on the following day Mr. Balfour, in a public letter to Lord Newton, advised the peers to follow Lord Lansdowne and pass the bill. Nothing would be gained by an attempt at resistance and it would be fatal to divide the party.——The Marquis of Lansdowne is making every effort to get enough members of the House of Lords pledged to let the bill pass so as to forestall the creation of new peers, but his success is yet doubtful. The dinner given to Lord Halsbury, the veteran champion of the prerogatives of the House of Lords, was a rally for those who had determined on fighting to the bitter end, but it was not largely attended.

**England's Attitude**

It, as is rumored, the incursion of a German gunboat into Moroccan waters was for the purpose of testing the strength of the Triple Entente of France, Russia and Great Britain, it has succeeded. Russia has notified Berlin of her entire agreement with the French point of view, and a simultaneous declaration of all the parties in Parliament shows that political divisions in England do not extend into the field of foreign relations. The calmness and unanimity manifested in the House of Commons when the Premier stated the position of the Government on the Morocco question was in striking contrast with the turbulence and animosity shown in the same chamber only a few days before when Mr. Asquith made his declaration on the veto bill. The statement of the Premier was read from a carefully prepared manuscript and should be given in his own words:

"It is obvious that the Moroccan question has reached a point at which it will become increasingly difficult, embarrassing, and anxious unless a solution is found. A too close analysis at the present moment of causes and antecedents might provoke in more than one quarter recriminations and retorts which it is, on every ground, desirable to avoid.

"I propose, therefore, simply to state to the House what the actual situation is today. Conversations are proceeding between France and Germany. We are no party to these conversations. The subject matter of them may not affect British interests. Upon that point, until we know the ultimate result, we cannot express a final opinion, but it is our desire that these conversations should result in a settlement honorable and satisfactory to both parties, and which his Majesty's Government can cordially say in no way prejudices British interests.

"We believe that to be quite possible. We earnestly and sincerely desire to see it accomplished. The question of Morocco itself bristles with difficulty, but outside Morocco in any part of West Africa we should not think of attempting to interfere in territorial arrangements considered reasonable by those who are more directly interested.

"Any statements that we have so interfered and prejudiced the negotiations between France and Germany are mischievous inventions without the faintest foundation in fact.

"We thought it right from the beginning to make clear that, failing a settlement such as I have indicated, we must become an active party in the discussion of the situation. That would be our right as a signatory to the treaty of Algeciras, as it might be our obligation under the terms of an agreement of 1904 with France. It might be our duty in defence of British interests directly affected by further developments.

"There may have been times when we were not sure how far this was fully understood. I am glad to say that we are now quite satisfied that that is not the case. The statement I made more than three weeks ago, and the speech since made by the Chancellor of the Exchequer have, I hope and believe, made perfectly clear that we claim not any predominant position, but that of one party inter-

fered on any possible developments and in seeing a solution of the present difficulty.

"In our judgment, it would be a grave mistake to let such a situation drift until the assertion of our interest in it, owing to our previous silence, might cause surprise and resentment. That, I trust, has been sufficiently guarded against by statements already made.

"I repeat, we earnestly desire a successful issue of the conversations now in progress and I would venture in the general interest to make a strong appeal to the House not to enter into further details or open up controversial ground."

Mr. Balfour followed the Premier with an emphatic assurance of support from the Opposition, saying:

"If there are any outside these walls who had counted upon differences and absorption in home disputes, in the hope that they would make easy a policy which in other circumstances this country might reject, and if there are any who supposed that we would be wiped off the map of Europe because we have our difficulties at home, it may be worth while saying that they bitterly mistake the temper of the British people and the patriotism of the Opposition."

Mr. Macdonald, leader of the Labor party, said that the Labor members were utterly opposed to war, but he hoped that no European nation would assume for a single moment that party divisions weaken national spirit. Nevertheless, the Laborites of Germany, France and England would co-operate to the very last moment, he said, to seek peace and prevent two professedly Christian countries from resorting to the arbitrament of the sword over a difficulty that could easily be settled at The Hague.

**Agadir and Kongo**

The declaration of Premier Asquith, tho couched in diplomatic language, may be interpreted as warning Germany to keep out of Morocco, but permitting France to buy Germany off by concessions in the Kongo. It is understood that Germany demands, as compensation for the withdrawal of her warships from the harbor of Agadir, the cession of the entire coast of French Kongo as far inland as the river Sanga, and the reversionary claims of France and the Kongo Free State now annexed to Belgium. This part of French Kongo desired by Germany has an area of 200,000 square miles, therefore about as large as the whole of Morocco, and includes the two ports of Loango and Libreville. Libreville, founded by the French in 1849, is now a French naval station. Its harbor has no superior on the west coast of Africa except Dakar, also a French naval station. The commerce of French Kongo amounted in 1909 to $2,700,000 and the exports to $3,500,000. The French rights over the Kongo State depend upon a declaration made in 1884 by the President of the Kongo that France should have the right of pre-emption over every other Power should the Association at any time alienate its possessions. The French Government agreed that this right of pre-emption should not be claimed against Belgium, and Belgium in 1887 undertook to incur toward France the same obligation as the Association. Should Germany now secure the concession of this reversionary claim it would increase the attractiveness of Belgium, for if Belgium should at some future time fall into German hands, it would ultimately give to Germany the greater part of equatorial Africa, stretching from the Kameruns to German East Africa and cutting in two the cherished British project of an "all-red route" from Cairo to the Cape.——Agadir, which is apparently regarded by Germany as the equivalent of the coastal region of French Kongo, is a village of a few hundred natives, situated on the summit of an isolated hill about 600 feet high. The harbor, tho an open roadstead protected only on the north and east, is better than other Morocco ports, as seven or eight fathoms of water extends to within a half mile of the shore. A Portuguese noble built a castle here in 1500 to protect his fisheries, and during that century, especially after its capture from the Portuguese by the Moroccans in 1536, Agadir became an important center of commerce, called by the Arabs Bab-el-Sudan, or "the Gate of the Sudan." But its prosperity making it a dangerous rival for northern Morocco, Sultan Sidi Mohammed captured the city, transported all its merchants to Mogador, and prohibited all business at Agadir. It has never been an open or treaty port and there are no foreigners resident. The German interests, which in the opinion of that Government called for the protection of a cruiser and two gunboats, seem to consist of the recent visit of some na-

tive agents of the Mannesmann Brothers in search of mining concessions. But it has long been the object of German aspiration. In 1904 the German Colonial Society declared Germany must have southern Morocco, "even at the cost of a war," stating that the Sus region forming the hinterland of Agadir had climate and resources suitable for colonization and should receive the 32,000 emigrants who every year go to the United States to seek their fortunes. The Sus Valley is cut off from the rest of Morocco by a spur of the Atlas running to the sea. During the Conference of Algeciras, which settled the control of the other Moroccan ports, no mention was made of Agadir. The German papers claim that the possession of this strategic point is essential for the peace of Europe, for France might bring an army of a million Arabs, Berbers and Senegalese across the Mediterranean at short notice, unless Germany is in a position to prevent it by raising a Mohammedan insurrection in the French African possessions.

**Foreign Notes**

The first air race of any extent on English soil took place last week under the auspices of *The Daily Mail*, which offered a prize of $50,000. The course starting from Brooklands, near London, included the following stops: Hendon, Arrogate, Newcastle, Edinburgh, Stirling, Glasgow, Carlisle, Manchester, Bristol, Exeter, Salisbury Plain, Brighton, Brooklands, a total distance of 1,010 miles. The race was won by Lieutenant Conneau, of the French navy, flying under the name of "Beaumont," the same who won the Paris-Brussels-London-Paris race. His total time in the air was 22 hours and 28 minutes. He was closely pushed by another French aviator, J. Vedrines, who arrived at the goal less than half an hour behind him. Nineteen competitors entered for the race. The English contestants dropped out at early stages in the course. ——W. Morgan Shuster, the American financial expert who was appointed to take charge of the Persian finances, finds himself involved not only in international intrigue but in a revolution. The Belgian Director of Customs at first refused to recognize the authority conferred upon him by the Persian Parliament as the sole person in power to sign checks on Government funds. In this the Director of Customs was supported by the Russian Minister, but when Mr. Shuster notified the banks that checks drawn by any other persons whomsoever were invalid, the opposition collapsed. In anticipation of an attack upon the capital by the ex-Shah, Mr. Shuster has organized a treasury guard and placed it in charge of Major Stokes, formerly of the British army in India. The Russian Minister has protested against this, but so far the Persian Government stands by the American Treasurer-General. Parliament has offered a reward of $100,000 for the head of the ex-Shah, Mohammed Ali Mirza. He has left Astrabad and is marching toward the capital.——The Spanish Government decided at last to take action against the conspiracy organized in Spain for the overthrow of the Portuguese Republic, and the force which has been collected in Galicia under Captain Couciere will be dispersed. Arms and stores have been seized and the leaders of the movement ordered to leave the frontier. The deposed King Manuel is said to have paid out immense sums in support of the movement for his restoration. The Pope is reported to have exprest his sympathy for the monarchists in a letter to the leader of the conspiracy. The Portuguese Government is showing a more conciliatory spirit toward the Church, and has addressed a letter to the bishops of Portugal, assuring them that the separation law is not intended to be hostile and requesting them to formulate any complaints they may have.——The new system of compulsory military service was inaugurated in Australia the first of this month. There were mustered in at the start 105,000 boys from fourteen to eighteen years of age for the training which they are required to take for at least four whole day and twelve half day parades and twenty-four night drills for a year. Next year 30,000 youths of eighteen will enter the ranks of the national militia and in seven years it is estimated the citizen army will number 120,000 trained men. A compulsory naval force was started at the same time with a total enrollment of 3,700.

## Miss Ellen Fitz Pendleton

Miss Pendleton, who has just been selected to succeed Miss Caroline Hazard as President of Wellesley, is the first graduate of the college who has been called to direct it. Miss Pendleton was graduated in 1880, and was an instructor in mathematics from 1888 to 1897. She was appointed secretary of the college in 1897, and as dean from 1901 to 1911, she has had charge of all relations between Wellesley and preparatory schools. Miss Pendleton brought the administration of the certificate system to a high degree of efficiency. The college has been enabled thru this system to keep in close touch with even the most distant schools and to maintain vital relations with them. She therefore takes up her duties not only with a long experience in administration, but with an intimate knowledge of the academic work of the traditions of the college. She is a woman of unusual personality with the gifts that bind others to her as a leader. Miss Pendleton was born in Westerly, R. I. She has long been identified thruout the country for her interest in college clubs and her efforts to centralize their activities.

## Dr. Lemuel Herbert Murlin

Dr. Murlin, since 1904 the president of Baker University, at Baldwin, Kansas, has been appointed president of Boston University. Dr. Murlin has had an exceptionally wide experience in a large number of different colleges, and has also been closely identified with religious work. He was born in Ohio on November 16, 1861, and graduated from Fort Wayne College in 1886. Since that time he has studied or taught at eight institutions of learning. He secured the degrees of A. B. and S. T. B. at DePauw University in 1891 and 1892, the degree of B. D. at the Garrett Biblical Institute in 1899, S. T. D. at the University of Denver in 1897, D. D. at Cornell in 1897, and LL.D. at DePauw University in 1908. He also studied at the University of Pennsylvania, at Clark University and in Europe. He was ordained as a Methodist Episcopal minister in 1887, and among other positions was acting minister of the American Church at Berlin in 1909-1910, during a year's leave of absence from Baker University. Dr. Murlin has held important positions in various educational and religious organizations. He will be inaugurated in October and will assume his new duties at that time.

# Education

BY COUNTESS ELEMER DE LONYAY

[While humanity can rarely succeed of themselves give correct knowledge and judgment, ... is natural [illegible] to interest our readers to learn what are the conclusions on so important a subject as education reached by one who has observed life in the highest circles of continental Europe, first as the daughter of King Leopold II of Belgium, then as Archduchess Stephanie, the wife and widow of the Crown Prince of Austria.—Editor.]

EDUCATION is a democratic task. It knows no difference of birth. In every civilized country it should play the most important part in the life of each individual. Everything that signifies balance is dependent upon it, and a well balanced mind is conducive to contentment and happiness. Where education is neglected we find vice, frivolity, discontent, arrogance, overestimation of self, imperiousness, injustice, hatred and debasing sentiments which make life a torture.

If properly carried out education should aid the State in securing order, ensuring welfare, alleviating suffering, and diminishing wickedness. The desire for happiness becomes more potent daily, as the wants of life and physical welfare grow in intensity. Every one wants to be somebody, wants to arrive somewhere, and very few are satisfied with what they have or what they are.

The spirit of the present times is a breathless struggle and a mad rush for something unknown. The dispositions of today lack that sacred peace which is brought about by the self-satisfying consciousness of duty done. There is too much excitement and impatience, and not enough joyousness in the chosen work, in the work accomplished, and furthermore there is a lack of respect due to oneself and others. Unlimited egotism, an absolutely appalling blind love for the ego, delight in slander, and the vices of envy, vindictiveness, base ingratitude, or an absolute indifference to all moral codes which is most discouraging, have penetrated with uncanny persistence into all the different classes of human society. Principles are thrust aside; the spirit of the modern times has no use for them. Religion is troublesome, unpleasant, and the exercise thereof is an old-fashioned custom. Work, occupation of any kind, is good for the poor and the suffering, who are in need of it, or for the mentally weak, who find satisfaction in it.

Any interest for the beautiful and good from sheer love of it creates a suspicion in our generation of eccentricity. To strive for higher ideals by serious work, or to master the sadnesses of life, is, according to modern conceptions, a fallacy, which is a pretty theory but impossible of practice.

Doing works of love for one's neighbor, in assisting the suffering or those who are unable to provide for themselves, ceases to be a pleasure in itself, but gives way to a desire of personal interest or love of popularity.

The passions are supposed to be allowed to run their course freely in this whirl of conflicting allurements of pleasure, until the senses become oversatiated, or until sickness or incarceration brings back reality. There is a restless, nervous going back and forth, a drifting without purpose, an apathy of boredom, which is the result of the lack of selfconsciousness in achieving the work, by which the cares are numbed and the hours are made to pass more quickly.

People at the top of the social scale, be they well born or should they have risen socially, are exposed to ridicule, laughter and slander. Deserving or not, they are subject to the same fate. They are dissected by the poisonous scalpel of the tongue or with the sharp point of the pen, neither of which ceases in its merciless task until its kindly work is done and the victim is entirely torn to pieces. And why all this? Lack of education!

Everywhere I look for the origin of these false theories and their accompanying circumstances, and I believe that all common-sense people will agree with me that the main reason for this unnatural condition of affairs is a lack of education. There are many who object to work and serve, or if compelled to do so rebel

against it. They believe that work is humiliating and debasing. Why? Because they have never been taught that work is no disgrace, nor have they learnt the contrary, that work is uplifting and ennobling, and brings in its train thousands of blessings.

Among the better classes of society the men follow their vocation more ardently and see to the fulfilment of their duties; the women more rarely. The women crave for entertainment, liberty, dress and emancipation. Why? Because they have never learnt what enjoyment is to be derived from a vivid interest in their proper occupations.

And this is the state of affairs all along the scale of the human hierarchy, up to the palaces of the rich and of the princes. Among the latter only too often arrogance, pride, avarice, pretentious consciousness and unquieted desires for pleasure join in maddest saraband.

Title, power, honor and money turn the heads of many. They live in the delusion that they belong to another sphere of humanity. They imagine that they stand so far above others that they may take every privilege, be regardless of consideration, give any insult, until the hour strikes when the veil which hid reality is torn asunder. Often it is too late, and causes misfortune to families, and distress to nations. Why? Because, even in these classes of society, only too frequently it is neglected to impress children with those mighty and unshakable principles which will make them real human beings! Because they are permitted to grow up with the most distorted ideas, and they are educated according to a uniform system that is often not within the reach of their capabilities and powers, or they are tortured with exaggerated studies which strain them mentally and weaken them physically, instead of performing the essential part of every education, the molding of mind for broad and humane ideas.

The natural great minds and the strong of a country are made for nations, and he who forgets that only injures himself. One should be able to look with admiration upon the actions of those highly placed in power or position, and not be compelled to turn away from them with pity or even loathing. This should be explained to all youth, so that it becomes a part of its flesh and blood. In a time like ours, where so many are only waiting and watching to find something with which to reproach the members of dynasties, the nobility, the rich and the highly placed, it is especially necessary for them to be cautious in not arousing people or incensing public opinion by their actions.

The actions of the well born and those placed in responsible positions should be like a lighthouse on the shore of the ocean, which throws out its light for the protection of fishermen and seamen in storm and gale. In spite of intrigues and malicious influences, their actions should bring blessings and happiness, and should be an example to humanity for its welfare! Parents, teachers and tutors, let this be your aim! A well planned education, systematically carried out for all classes of society, which in equal degree develops the powers of learning and the attributes of the mind, as it provides for the physical development, is utterly lacking.

In schools and private houses too much importance is attached to instruction, and yet the instruction that the children receive is wanting in many of the most vital points. These poor creatures have no time to digest what they learn. What is to be taught all children, and what is to be impressed upon them by every means at command, are the fundamental principles of education: Decency and hygiene, unshakable faith, humanitarianism, the importance of public welfare; and sympathy and contentment should be awakened in them, as well as the enjoyment of the beautiful, which, together with the love of doing good, forms happiness. The senses should be stimulated to take an interest in the arts, which are bound to influence the development of the mental and psychological powers; and special attention should be given to the furtherance of those tendencies which might lead to the choosing of a practical vocation.

Girls should also be instructed to cook, to iron, to sew. They should be taught the idea of family life, order, cleanliness; and should have explained to them the importance of a practical understanding of the thousand necessities of life, especially in the value of time and money.

Schools of learning which are not

schools of cultural education are of no value today. Such schools are worthless from an educational standpoint, as they do not give any moral stability to children, nor convey any understanding for the practical, useful and necessary things of life. What the children learn in such places is hardly imprest upon their memory; whereas they often read things which their immature minds cannot grasp, and which yet leave an impression that frequently accounts for actions in their later life.

The hours spent in such schools are not sufficiently incentive and are often a torture to both teachers and scholars. The examinations prove the correctness of these observations. And such poor, pitiable young objects are supposed to be prepared to battle as youths, men and women against immorality, hatred, alcoholism, brutality, infidelity and disobedience. They are to bear poverty with resignation, and to overcome falsity, injustice and brutality. This is impossible! Youth, thirsting for ideals, which is not given that for which its unspoiled, childlike nature craves, should not be fed with dry and abstract mental food. Want and hunger often lead the individual astray, and sickness and despair frequently throw him out of his moral balance. The large masses of those who are in need, the dissatisfied, are simply thrust into rebellion with all its horrors. It is thus that revolution, mutiny and anarchy arrive.

On the day of examination everything is beautifully clean in the schools; everything is prepared for the occasion. The children look spic and span, the teachers are pleasant and to all appearance in a festive mood.

The clergyman, the principal, several gentlemen of the board of direction, the parents and the relatives of the schoolchildren are present. Little speeches are made and books are examined. It is determined whether the number of exercises has been accomplished, whether the writing is legible, and whether the drawings represent something. After that questions are asked from the Catechism, about arithmetic, history, geography, literature and physics. Tremblingly, without having an idea of what they are saying, the dear little things hesitatingly bring forth their answers, like little parrots. Teachers as well as children are intensely excited; there is a depressing silence; beads of perspiration appear on the forehead; there is fear in the heart and a blush on their cheeks; the air is stifling. And this is called an examination for beings who will be called upon to protect and probably support their parents, to choose a vocation for themselves and in later days to lead their children on the path of goodness, honesty and practicability. This is impossible! These children, having finished their years of schooling, hardly know the difference between right and wrong. These children at the age of fourteen years are supposed to go out into the world full of dangers in order to earn their bread, or are sent to remain with their relatives in hamlets, villages or towns, where they may have to meet brutality without knowing how to deal with it. They see and hear, and their immature and innocent minds are not prepared to profit by the experience.

No one had led them, no one has tried to mold them; they grew up like the grass in the fields. Would it not be a blessing if in children's institutions the character of the dear little ones were formed and guided while they are at play? The system of education and instruction is greatly behindhand, and is sadly in need of a categorical change, so that at last different conditions may make a triumphant entry.

He who solves this great and urgent problem with love, from sheer benevolence toward his fellow creatures, and solves it conscientiously, may expect the most splendid monument, and deserves eternal gratitude in having acted for the well being of the great family of mankind.

Oroszvar Castle, Austria.

# Harvard Under Two Presidents

BY WARREN BARTON BLAKE

["I call, therefore," says John Milton, "a complete and generous education that which enables a man to perform justly, skilfully, and magnanimously all of the offices, public and private, both of peace and war."—EDITOR.]

"Our new President of the College is winning praises of everybody. I take the inmost satisfaction in him, and think him just the best man that could have been chosen. We have a real captain at last."

THESE words were not written yesterday, nor yet two years ago, when it became known that President Eliot was to step down, and that his successor was to be Abbott Lawrence Lowell, professor of the science of government. The paragraph occurs in a letter of a kinsman of President Lowell's, himself a professor; one James Russell Lowell, critic, poet and satirist. Lowell addressed the letter from Elmwood to the late Charles Eliot Norton, and dated it December 10, 1869. The "new President of the College" was the actual President-Emeritus — Norton's second cousin. This is a family affair.

Also a national affair. Tendencies remarked at Cambridge in '69, and in the seventies, and tendencies today, have had and will have direct influence upon a considerable number of students at Harvard and at institutions thousands of miles from the Massachusetts Cambridge. And Harvard has no intention of sacrificing its traditional position of leadership. President Lowell's plan for an exchange of professors each year with some of the smaller colleges—Grinnell College in Iowa, and Colorado (at Colorado Springs), and Knox, and Beloit, to begin with—may readily develop into an important feature of American college and university instruction.[1]

The Harvard of that earlier day was, however, above all if we compare it with the institution of today, in no true sense a university.

On President Eliot's accession the Divinity, Law and Medical Schools had, for several years, existed as "departments"; but a testimonial of good moral character was still enough to open the doors of either of these last departments. It was otherwise under "our new President of the College," yet not till

[1] "A professor from Harvard University is to spend a fourth of the academic year at each of these colleges, giving instruction in the regular college courses. In return, each of these colleges will send one of its younger instructors to Harvard, where, during half of the academic year, he will serve as assistant instructor in one of the courses. One-third of his time is to be devoted to teaching the best to graduate study and research. The arrangement becomes effective next fall, and Prof. Albert Bushnell Hart, of the Department of History, will be Harvard's first representative under the system of close exchange. The colleges stand for the 'cultural' ideal of education, as opposed to the vocational or utilitarian ideal of the State Universities, and the plan is, essentially, one of coöperation. Coöperation governs even the financial arrangements. Since the first step was not taken by Harvard, it is an interesting circumstance that Harvard graduates do not dominate the administration of any one of the institutions with which an exchange is effected.

1896 was a college degree required by the authorities of the Law School—that or standing equivalent to that of a Senior in Harvard College.[2] When Dr. Eliot took charge a graduate of three years' standing could buy a master's degree on terms resembling those which still govern this traffic at Oxford today. All this was changed more than forty years ago, however—and here is the significant point—the president began, thus early, to develop a genuine graduate school. We may say of this great administrator that he found Harvard a college and that he turned it over to President Lowell a university.[3]

What a record it is! In the first twenty-five years of the last administration the number of students was tripled, the instructing force nearly quadrupled, and the invested wealth of the institution, exclusive of halls, museums, collections, etc., increased in a like ratio. The development was, however, far from being merely numerical and material. It was an unprecedented step upon the part of the Harvard Corporation and Overseers to choose for chief executive a thirty-five-year-old professor of chemistry, and that selection was pregnant with results. One of these was the development of the University as a teacher of science.[4] Another was the evolution of what we call the elective system. This system had been "seriously undertaken" at Harvard from 1865; two years later about half the work of the three upper classes was elective. The extension of the system would have been even more rapid but for its costliness. At it was, the President-Emeritus provided a gradually increasing number of departments, each offering an increasing number of courses of study, till the Harvard catalog was as thick as the family Bible and the callow undergraduate could choose such subjects as paleontology or Indic philology, either for serious study or for skimming in lecture courses, till practically the sum of human knowledge in all branches was laid before the said undergraduate, who was free to drink of the stream pure and undefiled at his own sweet will—provided only that his faculty "adviser" (generally not an exacting authority) made no protest at his decisions, and provided that he passed certain tests before entering Harvard, and could read and write his own language, besides French and German. Great was the opportunity and great the faith in student nature which was the opportunity maker's.

Writing in 1894, Professor Dunbar, the economist, said of the elective system:

"If it were weakened, stunted, or rejected, the intellectual gain of Harvard would be as

[2]This last clause was soon dropped. Since 1900 a bachelor's degree has been a *sine quâ non* for the intending medical student. In both law and medical schools it has been Harvard that has raised the standard of admission.

[3]Dr. Eliot himself has said that Mr. James Bryce, in the old days, remarked that Harvard was no university, but only a struggling college, with uncertain relations to learning and research, loosely tied to congeries of professional schools. In those days the American educator had achieved the college, and little else; the problem of the college's relation to preparatory school and to professional school did not have great importance, for the college was itself little more than a well provided secondary school, while the "graduate departments" were taken none too seriously. In the year of Dr. Eliot's election to the presidency of Harvard, he contributed to the *Atlantic Monthly* two articles on "The New Education." In the winter of 1866-7, he wrote, "Arrangements were made by the government of the university for the organization of an advanced school of science and literature." The "literature" was exclusively classical. This project failed, after having been limited (1848) to "the Department of Physical and Exact Science." The graduate school experiment at Yale applied also to Sanscrit and other Oriental languages, the classics and modern languages. There were few genuine graduate students, however, and tho Dartmouth and Columbia undertook at this time to give similar graduate instruction they were no more successful. "At Brown University (Providence)," Dr. Eliot recorded in his article of February, 1869, "an English and scientific course was introduced into the college plan as early as 1846. It was soon lost to sight in the loose and exaggerated elective system which prevailed there for some years. But it has reappeared." Under Dr. Eliot the Harvard Graduate School gradually rose to its present commanding position; yet so late as 1885 the number of graduate students had only just passed 50. Four years later it was close upon 100. Today there are over 700 graduate students at Harvard out of 6,000 at American universities. Numbers are not all, however, and President Lowell himself has complained (*Atlantic Monthly*, June, 1909) that the bulk of the Graduate School's students, at Harvard as elsewhere, are not of first-rate quality. "Much of the instruction consists of burnishing rather soft metal." Nor does President Lowell fail to criticise the principle upon which students have been attracted to graduate schools generally. Instead of remembering that resistance must be overcome if you are to generate energy, the policy of the smoothing the way of the graduate student has been practised. He has been freely subsidized, like the theological student, till the graduate school has become "the easiest path for the good but docile student, with little energy, independence, or ambition."

[4]"The time had come," records the late Professor Charles F. Dunbar in the *Harvard Graduates' Magazine*, of June, 1894 (reprinted March, 1909), "when a rapidly increasing demand for something different from the traditional American college and professional school was to make itself felt. The sciences were pressing their claim for equal rank with the ancient learning. Here and there, among institutions which Harvard was perhaps tardy in recognizing as her rivals, were signs of action for meeting the needs of the new times."

ABBOTT LAWRENCE LOWELL

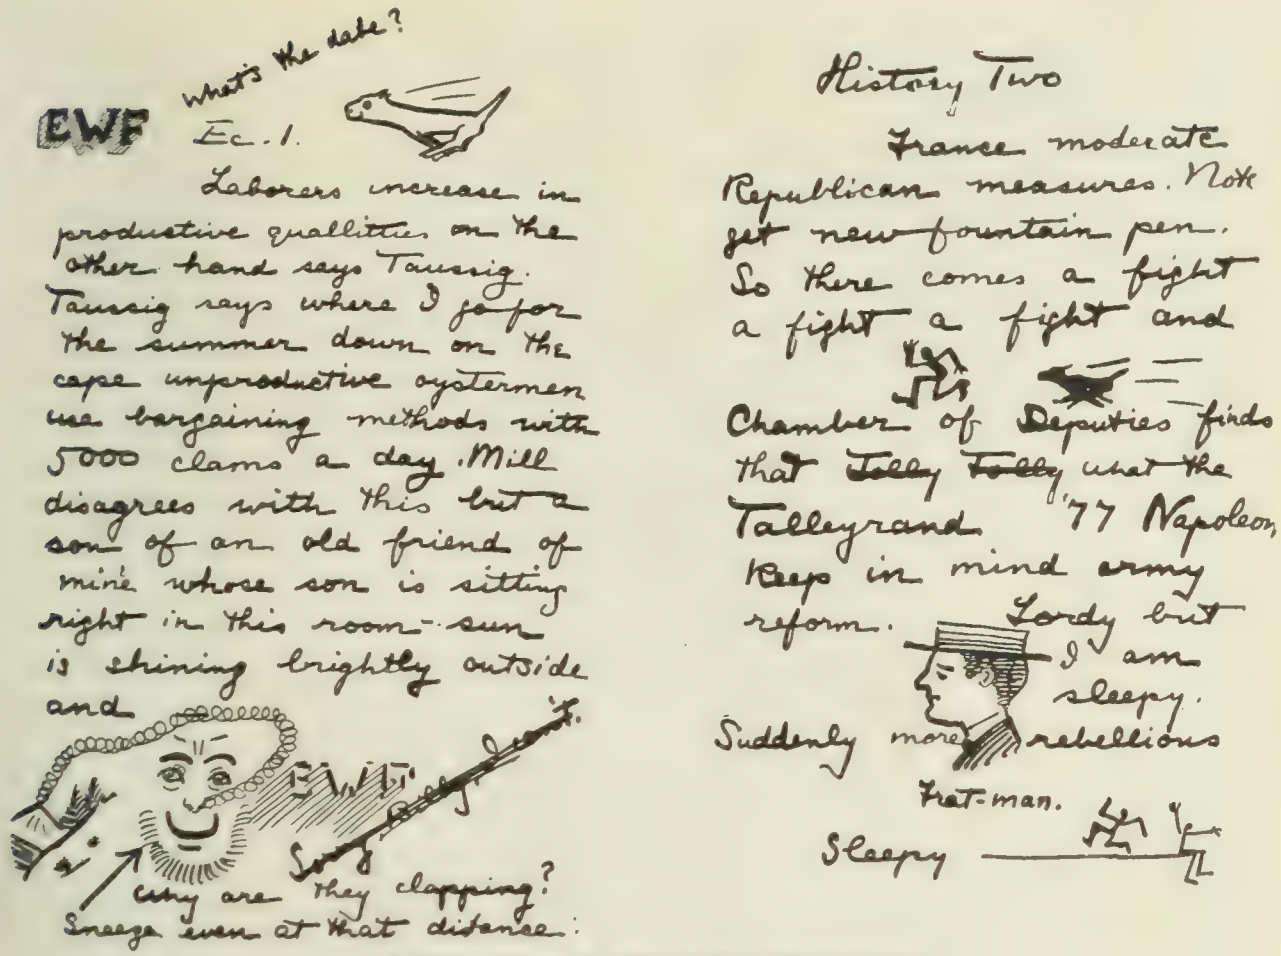
certainly imperiled as it twenty-five years ago she had made the wrong choice, and had taken the easy path of routine under some leader contented with the past."

Since 1894, the standpoint of most educators of the late Professor Dunbar's high position has materially shifted. Many educators of mingled sobriety and progressiveness look to the "weakening" — or rather the equilibrizing—of the elective system as the one step in Ameri-

an collegiate education likely to restore that weak sister to health and strength. "Intellectually," writes a member of the class just graduated, "the first-year student [under the new regime] finds Harvard very democratic, in that she does not constrain him to violate his tastes, and yet gently forces him to *develop* such tastes—and this system is an improvement over both the narrow, prescribed curriculum of old Harvard, and the planlessly broad elective system inaugurated by Dr. Eliot."[5]

Dr. Eliot's development of election was, to be sure, only one part of a great work, and, doubtless, an indispensable. But progress is to be attained only in alternately following and diverting tendencies. Fixed obedience to one idea does not spell advance. The radicalism of yesterday is today's retrogression. If we saw the problem of higher education today only as Dr. Eliot saw it in 1869, or Professor Dunbar in 1894, perhaps we should have to confess that our own education was a failure, and that we Americans had stood still during four decades.

Dr. Eliot found collegiate education on an eminence, albeit only a foothill as we see the map today. Professional and graduate school education occupied low ground and stood in danger of submersion. Naturally, properly, and most effectively, Dr. Eliot applied himself to strengthening the professional schools and to developing the graduate department on lines parallel with those schools. In all this he succeeded so well that he has never needed either defense or panegyric, tho he has had his share of both. President Lowell's task must be a different one. No longer is the academic problem principally a question of endowment, of equipment, of ways and means—tho these questions are everlasting. Neither does the fault of modern education lie, principally, in its teaching, or the requirements for the degrees. In Prof. Paul Shorey's words, "it is ideals and aims that need to be liberalized": a slow process, the first step in which must be a clearer self-consciousness on the part of American scholars and a fuller appreciation of the problem which the development of the American university has created for them. The task is "to redefine and so far as may be harmonize the aims of culture and scholarship without undue concessions to the gushing dilettante, and to emancipate ourselves from subservience to German influence."[6]



From the outset, beginning with his inaugural address itself, President Lowell has emphasized his concern with collegiate problems and conditions. Perhaps the college has been neglected in the development of the university.[7] But even if it has not been neglected, too much heed cannot be paid to its work, the spirit of its work,[8] and the conditions of its work. Somehow the American college of today reminds me of an overgrown schoolboy, well dressed, and with excellent traits to his credit, but missing connections between stockings and trousers. He has grown faster than was really good for him, and his parents' ideas haven't grown to match. His parents'

[5]Paul Mariett, article entitled "The Underlying Spirit," *Harvard Illustrated Magazine*, May, 1911.

[6]New York *Evening Post*, May 13, 1911.

[7]"The old college course concerned itself primarily with conduct. . . . The spirit of research seeks the things of the mind for their own sake."—Edward A. Birge: "A Change of Educational Emphasis," in *Atlantic Monthly*, February, 1909.

[8]President Lowell points out that, a century ago, the English universities awoke to a situation much like ours today. To restore scholarship to respectability, among their students, they quite frankly resorted to a system of prizes and rewards. "First in one subject, and then in another, they established a degree with honors awarded in several grades, and they succeeded in making the honors not only a goal of ambition, but, what is more, an object of general respect. They have prizes, too, which are eagerly sought." Harvard has latterly been attempting to achieve a similar amelioration by not altogether dissimilar means. A committee of the faculty was appointed during the year 1908-9 "to consider how tests for rank in college may be made a more generally recognized pleasure of intellectual power." The committee labored to the end that every student should make a choice of electives tending to secure for him "a systematic education, based on the principle of knowing a little of everything and something well"—also that he should plan his course seriously and as a whole. A system has been devised by which students are encouraged to inscribe themselves as candidates for a degree with distinction, instead of satisfying themselves with "a gentleman's C"—or mediocrity. Candidates for Degrees with Distinction numbered, this year, as follows: Biology, 1; chemistry, 10; classics, 10; engineering, 3; geology, 2; fine arts, 2; German, 3; history, government and economics, 1; history and literature, 2; history and political science, 53; mathematics, 5; philosophy, 4; physics, 2; romance languages, 3; semitic language and history, 1. Of candidates for honors there were 5, of whom 4 were specializing in the study of their own language. For the conditions upon which Honors or Distinctions are awarded, see the *Official Register of Harvard University*, September 6, 1910 ("Rules Relating to College Studies"). The distribution of Final Honors, 1910-1911, was as follows: In mathematics, final Honors were awarded to 2 Bachelors; in the Classics, to 4 (one receiving Highest Honors); in the English to 2 (one receiving Highest Honors); in Romance languages and literatures, to 1; in literature, as follows: especially Greek and German, 2; especially Greek and English, 1; especially Latin and French, 1; especially Latin and Italian, 1. Second year honors were awarded to 4 students of the classics, one receiving Highest Honors.

LEAVES FROM A STUDENT'S NOTEBOOK

original notion was that opportunity was enough. If that were so (says the new university president) "hereditary wealth, which vastly enlarges opportunity, ought to increase intellectual productiveness." As for the college freshman, he has left behind him the old schoolboy motive for hard study; the professional motives are not yet in sight, and, as President Lowell says, it is not easy to make him appreciate the seriousness of the education within his reach. "He means to do reasonably well, but he has no idea of the benefit to be derived from striving for excellence." Of the first importance to him is the inculcation of scholastic ideals.[9] The trouble is not simply that undergraduates don't study, but they don't even agree that they *ought* to study. Therefore this last will be one of the most difficult of the president's tasks. Certainly the free elective system has reduced to a minimum the spirit of competition, in enlarging the scope of it. "Like the Caucus Race in 'Alice in Wonderland,' every one begins and ends where he pleases."

President Lowell has long preached the need of attaining collegiate "solidarity"—intellectual and social cohesion; the need of regaining it, rather, and that, too, without retrogression, without sacrificing individual variation. "The indi-

[illegible] moment question the great value of the activities outside the class-room. [illegible] but while the desire for high scholarly attainment seems to have declined in the last generation, the interest in other activities, except athletics, does not seem to have increased, if indeed it has not substantially lessened also. Contentment with mediocrity is perhaps the greatest danger that faces us, and it is closely connected with the feeling among the students that college is a sort of interlude in serious life, separated from what goes before, and disassociated with what follows. . . .

"The attitude of students in college and in the law school towards excellence in their studies presents a sharp contrast with which every one is familiar. . . . But if rank in the law school indicates future success, and rank in college does not, it follows that they must be taken by very different men, and that is

vidual student ought clearly to be developed," he has written, "both in his strong and in his weak points, for the college ought to produce not defective specialists, but men intellectually well rounded. . . . Every student ought to know, in some subject, what the ultimate sources of opinion are, and how they are handled by those who profess it." It is, in part, to develop this knowledge and this cohesion or solidarity that the founding of freshman dormitories is advocated by President Lowell, and that in these dormitories freshmen are to enjoy the social and intellectual comradeship of their seniors—tutors if you care to name them so.[10] The new spirit in American education is against the familiar doctrine of *laissez faire*. "The average professional student can hardly be said to be in residence," President Tucker has written; "he may live anywhere, and for that matter, anyhow." This has been too nearly true of the freshman as well.

The conditions of college education limit (let us not forget it) the possibilities of the higher education—represented by the work of the graduate school and professional schools—just as college work is conditioned by high school and preparatory school class work and spirit. A professor in the University of Chicago has even averred that the superiority of the foreign university "rests almost wholly on the severer discipline of the German gymnasium and the great English public schools." There has for some time been a general sentiment that the American college is on probation: that it must justify itself. First of all, then, it must effect a better coupling both with preparatory school and with those studies and activities for which it is supposed to prepare. We are tired of being told that it is an "accidental development," marred by maladjustments. Since the college degree is a stepping stone to pedagogy and the professions, the requirements in college must be such that the future teacher or lawyer or physician has been developed mentally as well as physically by the residence within the academic cloister. A few years ago, we used to hear it said that college studies were of small significance. "It's your friendships, your relaxations, your amusements, that will broaden your horizon and give you the *cachet*," the phrase ran.[11]

Now, President Lowell is the last of

indeed, the opinion not infrequently expressed by the students, who sometimes go so far as to say that in the law school the men who have been "sports" in college pass the "grinds." This is a matter susceptible of measurement by figures; and . . . for this purpose the records of the Harvard alumni who graduated from the law school during the past twelve years were examined, and tables were made showing what proportion of the men who graduated from the college without a *cum laude*, with a *cum laude*, with a *magna cum laude*, and with a *summa cum laude*, graduated with a *cum laude* in the law school. The results were as follows:

| | | Per cent. |
|---|---|---|
| Total | A.B.'s obtaining LL.B. *cum laude* | 18+ |
| Plain | " " " " " | 7+ |
| *cum laude* | " " " " " | 20+ |
| *magna cum laude* | " " " " " | 40 |
| *summa cum laude* | " " " " " | 57 |

"Striking as these statistics are, they become still more impressive when we reflect that of the thirty plain A.B.'s who graduated *cum laude* from the law school eight had entered college in their senior year, and hence could not graduate from college *cum laude*. Deducting them we find that the percentage instead of 7+ is 5.6+; and of all the thirty men only one had an average in college of less than C." This year the A.B. *cum laude* was awarded to 69 men. Ten of these, a larger number than received the *cum* for specialization in any other field, were students of economics; 9 were students of chemistry; 7 were students of history; the same number were students of history and literature, and of the classics.

[10]But not paid instructors alone are to be counted on—at least while the funds for freshman dormitories remain inadequate. "In every college," writes Assistant Dean Castle, of Harvard College, in the *Atlantic Monthly*, "there are numbers of good upper class men who are eager to coöperate with the faculty in starting freshmen along the right path, and it is amazing that thus far so little advantage has been taken of their services. Each of these upper class men should be given a list of from five to ten freshmen whom he would make it his duty to know. He would talk over with them their work and their play: their study, their amusement, their athletics." The system of "student advisers," headed by a "student council," has now been in operation at Harvard for one year. Fundamentally sound, it is capable of development and of improvement. As for the freshman dormitories, a financial campaign in their interests is at present being carried on from Philadelphia, New York and Boston. The dormitories are to be built on the Charles River Parkway, facing South, near the Bridge to Soldiers' Field. Four will be necessary, at a total cost of about $1,700,000. In its circular, the Harvard Freshman Dormitories Committee for the State of Pennsylvania says, in part:

"This plan does not so much involve the restriction of the freshmen as it does their development as a community, under the guidance and influence of upper classmen and young professors, wherein the standards of the best men in the class will be the standards for the whole. The problem of properly guiding and assisting the freshmen is becoming more acute because of the increasing size of the classes and of the fact that many boys arrive in Cambridge amid strange surroundings and without acquaintances. To understand the need and desirability of these dormitories it is only necessary for every graduate to recall the men of worth and ability who were too long unknown to their classmates, or the men in trouble for lack of friends. Such cases will be rare indeed under the proposed plans."

[11]This reasoning was probably most familiar in milieux from which boys were sent to college via expensive preparatory schools. "I don't want John to be much of a student," said one type of father. The *Harvard Alumni Bulletin* has published statistics showing that of 178 first and second group scholars posted by the authorities during the last academic year only seven men represented Groton, Middlesex, Pomfret, St. George's or St. Paul's. Undergraduates

all conceivable college presidents to belittle the worldly, social, psychological and physical advantages of a college course whose chief interests are judicious loafing, strenuous exercise of the body, and reasonable plaisance. A track athlete in his time, a close-knit man of bodily and mental vigor, a man of notable sanity and toleration, he is neither visionary nor martinet. He realizes, too, that, athletics eliminated or minimized, scholarship would not necessarily take athletics' place as the dominant interest of student life. Yet he does not blink the fact that physical prowess commands a higher prestige than intellectual attainment, while even the college man does not apply his college standards in the outside world. The fact is that, while the phrase "academic cloister" has lost its original connotation, the college world is a world apart: that college life has no relation with what went before or what follows, and is not expected to have. That partly explains why the undergraduate who is altogether too intelligent to set Christy Matthewson above the late William James, or Johnson, Jack, above Johnson, Samuel, sees nothing absurd in showering honors upon the athlete aud turning up his nose at the conscientious student. Statistics are sometimes enlightening. Thirty-nine thousand dollars, the sum recently reported as available for the purchase of books by the Harvard Library during one year, is about one-third the sum annually spent, officially, upon Harvard athletics.

The Harvard president has put the question squarely that some of us have vaguely asked ourselves: What is the moral effect upon the character of the amiable college man of his four-year idling—his patronizing attitude toward educational opportunities — his application of the elective system not to courses alone, but to practically his whole course of conduct? The "amateur" of our colleges, an amateur in scholarship where he sometimes comes pretty close to professionalism in athletics, has found discipline, if at all, only in these same contests of brawn and prowess: his college courses are chosen because they are "pipes" or "snaps" or "cinches"; he cuts his courses when he pleases—at least as often as he dares; the idea of excelling any one else in what was formerly regarded as the serious business of the college student is almost as ridiculous as the idea of playing football purely from a love of bruises. At best, the college man under this scheme of things has a warped view of relative values. At worst, he loses his schoolboy habit of working for results, without gaining the manly habit of working for results plus the development of power, of self, of frequently inadequate intelligence. The American college graduate is not the most efficient person in the world—except when he is the hero of an American novel; he is as far as one can well imagine from being, in general, a lettered man or otherwise than a crude personality; he manifests a woful lack of intellectual enthusiasm or curiosity; he is, judging him from the standpoint of mentality, rather baby-minded than developed. The worst of it is, he looks down on his betters, and doesn't know how to perform with real efficiency a single function—off the athletic field. Not enough college men shine there, even.

"There would seem to be no intrinsic reason that our schoolboys should be more backward than those of other civilized countries, any more than that our undergraduates should esteem excellence in scholarship less highly than do the men in English universities," says the president of Harvard. The attention of the executive, as that of his professors, is focused upon ways and means of raising the academic standard for every student, and of sharpening the academic ambition of the potentially exceptional student.

tained in various undergraduate activities not direct

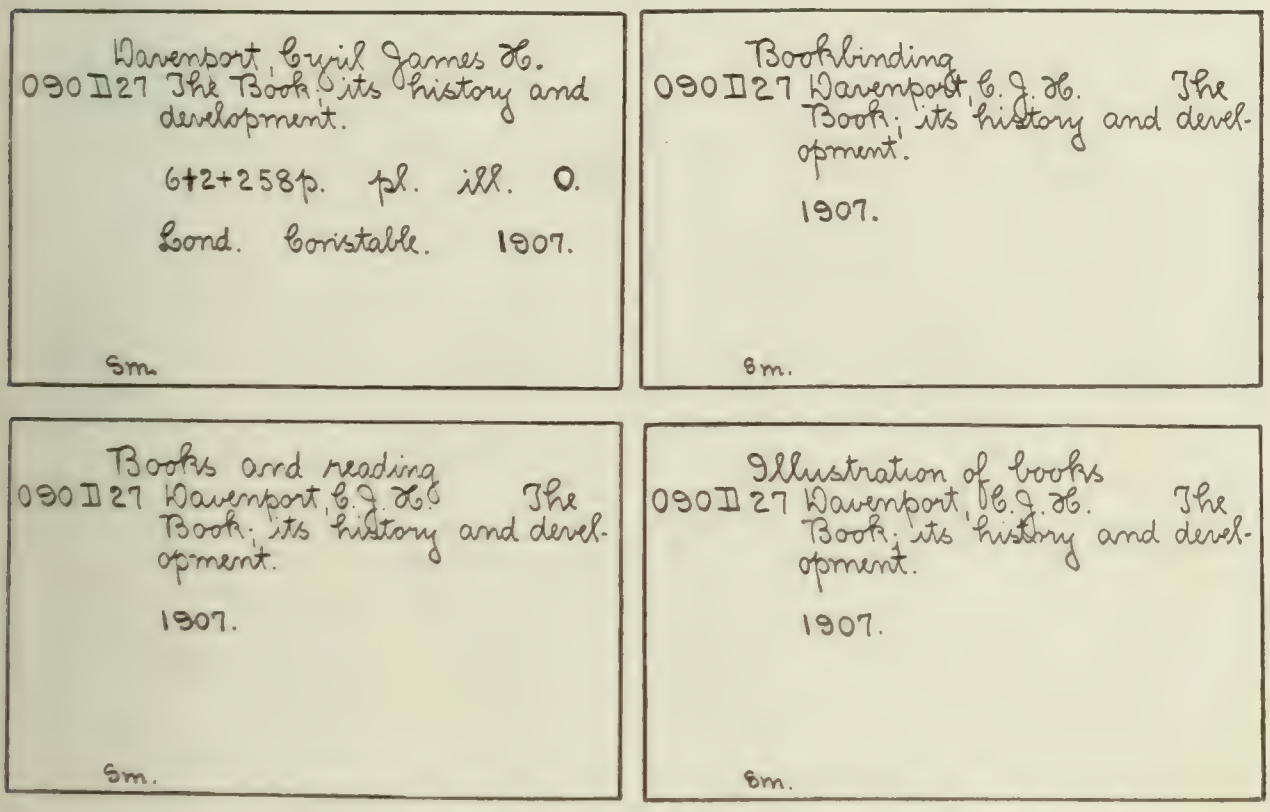
# Women in Library Work

BY JOHN COTTON DANA

Librarian of the Newark Free Public Library.

Of all occupations now open to women, work in a public library is perhaps the most attractive. This is not because the money return is large, for in this respect both teaching and clerical work have the advantage. Library work is attractive because it gives one pleasant surroundings, brings one into contact with intelligent people, helps one to keep abreast of the times, is not often unduly severe or trying to the nerves, and offers openings for many kinds of native talent to show themselves at their best.

A public library is the property of the people who use it. The librarian recognizes this fact and tries to make this school of the people as attractive and as pleasing as possible. If a public institution is to be inviting and helpful, those who work in it and for it must be interested in it, must wish it to gain in popularity and must be proud of its good repute. Now, a library's staff cannot have for it the feelings just mentioned unless they themselves find in it and in their work for it a certain pleasure, and enjoy in it a certain good fellowship with one another. As they are to one another, so, in large measure, will they appear to those who call at the library for books or for opportunities for reading and study. Within a library, therefore, must be found the



ASK THE LIBRARIAN!

Club women find the library supplied with study outlines and programs for the next year's reading

free co-operative spirit of the home. The presence in a library of this feeling of good will and helpfulness is alone almost enough to explain its popularity as a place in which to earn one's living; and when we add to this element of attractiveness the other factors already mentioned and especially the one I shall try especially to describe, it is easy to understand why library work appeals so strongly to so many women. This special point of advantage which library work offers lies in the many kinds of employment it includes and the many kinds of talent and skill to which it appeals.

ing these cards you can learn, if you will, and almost without effort, something about the best books of today and of all time.

Have you a good knowledge of books and skill in discovering quickly what are the main points in any volume you may pick up? To a good general education do you add a logical or at least an orderly mind? You may, then, after proper study and discipline, find a place in a library as a classifier. To classify books for the library is so to mark them that when they are arranged on the shelves in the numerical or alphabetical order of

CATALOG CARDS

Let me make my meaning plain. Do you have some skill with the pen, can you write clearly, are you painstaking and accurate and can you follow exactly rules set for your guidance? Then, even tho you are not distinctly bookish, you may find a place as a subordinate in a library's catalog department. If you add, to the modest talents mentioned, skill as typewriter, then you may still more easily find here a place. You would here write cards like those shown above. From two to twenty of these cards are written for every book which a library adds to its shelves. In writing or copying the marks and symbols you put on them, they will fall into groups; books of the same subject standing together, and groups on the same subject standing near other groups on allied subjects. Properly to add books to a library already classified, a library let us say of 50,000 volumes, so that one who wishes to consult them may readily find the ones he seeks, is a task calling for skill and common sense. It is work many women have learned to do well.

In preparing the originals of the records of books added to a library, making of the records an index called the card

catalog, other special qualities are called for. Especially does the worker in this line need a large fund of sympathy with other minds, quick appreciation of how the average person of intelligence will approach a subject. A library's catalog is a dictionary of world knowledge; it is, rather, an index to such a dictionary, the dictionary being found in the thousands of books on the library shelves. Skill in making such an index seems almost native to some of the women in our libraries.

The kinds of work thus far mentioned call for some general education, for long special practice or for peculiar aptness or for all three. But, in the same department in which the things last mentioned are carried out much other work of clerical nature is also done. If you are without much book knowledge but are patient, careful, accurate and skillful with your hands, you may find work in a library in this subordinate department of the library's index making. For example, in almost every library a book must be looked over before it is put on the shelf to see that it is complete, and, if its leaves are unopened, they must be carefully cut. This latter task alone is no light one. An active young woman can do little more than cut the pages of six or seven hundred volumes in a week's time of 40 to 50 hours.

In every book there must be pasted, inside the front cover, a book plate; if it is a lending book, there must be pasted in the back a pocket; on this pocket, usually a blank piece of paper, certain symbols or words must be written; a book card must be prepared, to be kept in the book when it is on the shelf and to be retained in the library when the book is lent to show to whom it was lent; on the back of the book must be put a label.

If you have always been a reader, and by a reader I mean one who has seized the spare moments to devour books, papers and journals from the time she was six until she was, let us say, twenty-two; and if you remember what you read; if you have an agreeable presence and know how to say "no" as pleasantly as "yes," yet tend to be obliging rather than the opposite, then you might find a place as an assistant at the lending desk of a library. Here the public calls for books and here an attendant, getting them from the shelves, delivers them. The routine is not simple. Modern libraries believe so strongly that the fewest possible difficulties should be put in the way of borrowers and the fewest possible duties laid on them, that they tend naturally to throw upon the attendant at the lending desk a large amount of detail.

The chief of the lending department of a large library must be a person of very decided genius. You can not aspire to such a position unless you have either a college education or its equivalent, a wide knowledge of books, no small experience in life, agreeable manners, and ability to meet people of all ranks on their own level. The routine is done by people who are not thus well equipped.

Have you read much in many lines? Is your memory retentive? Do books seem to you to have individualities and to be distinct from one another like so many human beings? Does a moment's glance at a book fix its general features in your memory? Do you feel almost instinctively what a book, and especially an encyclopedia or any other work of reference, can tell you? Then you may hope to do good work, tho perhaps only after some years of practice, in a reference department. To the person who delights in knowledge, and instinctively takes in and retains information of all kinds, and never forgets in which book a fact was found, to such a person general reference work especially appeals. Not a few women have some special talent along this line and may hope to find interesting occupation here.

Book surgery, book hygiene and book rebinding form a department of library work which was long neglected, but is now seen to be of great importance. Any woman who is clever with her hands and does not scorn manual labor could make herself useful in this department. In large libraries the head of the binding and repair department must be a person who knows and can answer questions like these, about any of the thousands of wounded books which come to her for attention: "Is it still popular, and should it therefore be rebound?" "Is it so trivial that it is not worth even an hour's

IN THE ART DEPARTMENT.

work of mending?" "Tho old and worn, is it a book the library should always have on its shelves?" "Is it a book-rarity, which should be carefully mended and then as carefully rebound?" "Is its paper so poor that to rebind it is a waste of money?"

A knowledge of book-making and literature such as these queries suggest is not all the head of this department must have. She must know about leather, cloth, paper, string, tape, thread, glue, paste and many other things which go to the making, repairing and rebinding of books; and she must also know enough about the binder's craft to be able to tell whether a book is skillfully and honestly rebound or not.

In many public libraries a third of all the books taken to homes are lent to children. The children have rooms of their own in most libraries; and here, if you are fond of children and have some tact in their management, you may hope to find a place. The work is not easy, but is not as trying as teaching. If you hope to make progress in it you must be a reader, as I have already defined the word, and especially you must know the books which children read and the books about children. Moreover, this children's work brings one in contact with the schools, and to be effective here one must know something about the teacher's work, her difficulties, her class-room conditions, her textbooks and her courses of study.

The kinds of work I have mentioned are done in separate and semi-independent departments in larger libraries. In some of them it is the custom to test the capacity, taste and skill of each new member of the staff, particularly of those not trained in any other library, by placing them in several departments in succession until the work they are best fitted for is found.

In the smallest library all the kinds of work I have mentioned and many other kinds also, as well as many minor details, are done by one or two persons, and it is in the small library that a young woman

THE CHILDREN'S ROOM.

THE SCHOOL DEPARTMENT.

Teachers select large lithographs, which they borrow to hang on the walls of their class-rooms

can find the best opportunity to show her capacity for work helpful to the community which supports her library; and an opportunity also to gain a broad general education and admirable training in the special field of library economy.

There is no public institution quite as broad in its possibilities of public service as the free public library in America, and especially the free library of the small town.

The library worker in such a library, if she has the wisdom and temperament proper for her position, does not need a great store of book knowledge when she begins, nor does she need great skill in the technique of her calling; for she will necessarily acquire these things if she performs her duties well and tries to take advantage of all opportunities. She must be a friend of her trustees, their adviser and their business manager; she must watch the funds and practice economy, yet not permit her community to think about the library in terms of parsimony; she must select and buy the books best suited to her town and she is the person who, if she is fit for her position, can do this to the best advantage, better than any book committee can do it. She must meet with and make friends of all patrons, old and young, and be their adviser in matters both serious and recreational concerning reading; she must attract the teachers that thru them she may reach the children; she must lead the children themselves from nickel libraries or, what is more difficult, from no reading whatever, to the good things in print for them, and the children must not know they are being led; she must know about women's clubs, and help form their programs and buy books that will be useful to their members; and she must not forget boys' debating societies, and lyceum lectures, and special duties in churches and in Sunday schools, and questions of village improvement, like sewers and sidewalks and trees and water supply; and she must be interested in all other things that con-

THE STAFF SITTING ROOM.

During the luncheon hour there is rest and recreation for the library assistants

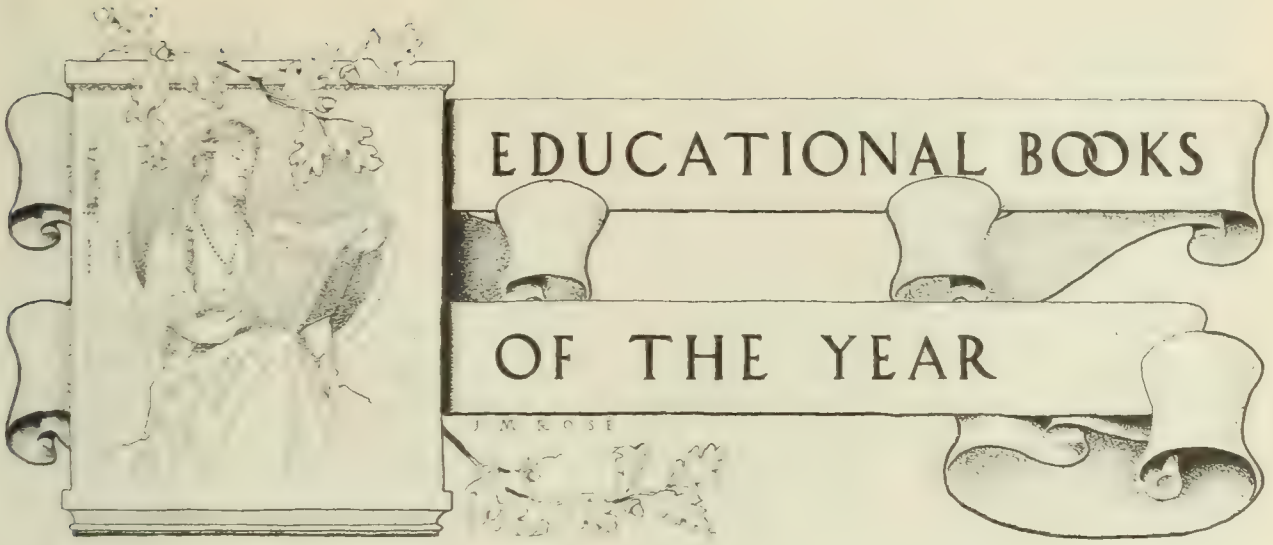
with her town, and ready to supply the book or journal that gives the latest and best information about them. The history of the town, the soil, the products, the climate, the geography, the industries, the fairs, the games, the festivals—all these she must keep in her mind as matters which may any day prove of special interest and may demand special information. A historical society, or a science museum, or a nature club, or a farmer's club may any day spring into life, and it will then be her pleasure to furnish some encouragement and much information to those interested.

I have set down thus briefly the wide variety of work which may fall to the lot of the librarian of the small library, because all of these kinds of work are found also in the larger libraries, are there much specialized and may there attract, as this paper tries to show, women of very varied gifts and accomplishments.

To go a little further with the librarian of the modest town and thus, tho indirectly, with the humblest or the highest assistant in the large library. The outside world must not absorb her; for she must know her books. To know them she must read unceasingly; not much in a few books, but a little in all the books, all the journals, all the book catalogs, all the many pamphlets and all the newspapers which come to her library. With her there can be no question of what to read; she must read it all; not all of all she sees, but a little of everything she sees. Any worker in any library who does not read, read, read, and forever read, can hope for and ought not to expect any notable success.

What this friend of books who has books in her charge and learns to know them and learns to know her town—what this modest librarian does for her community by the agency of her library and its books is another story. My purpose in this paper is simply to show that to work among a library's books for the people who own the books is a many-sided occupation, attractive thru its general character to all right-minded young women, and appealing especially to women of varied tastes and talents thru its many-sidedness.

NEWARK, N. J.



# The Quiet Wood

BY CLINTON SCOLLARD

I HAVE in memory a quiet wood
  Where silence has its altars, and the air
  Seems hallowed, hushed as tho it were for prayer,
Sacred to restfulness and solitude.
And when upon my mind grave cares intrude,
  Into these blessed depths I fain would fare
  For meditation, haply plucking there
The herb of solace for each bitter mood.

Then I emerge refreshed. I bear away
  Somewhat of the serene content of trees,
    The unexplainable largesse of flowers;
I walk exalted through a larger day,
    And know at night the guerdon of the hours
  Is deeper faith and wider sympathies.

CLINTON, N. Y.

THE progressive teacher always wants to know what new books have been published in his field during the year, tho it does not follow that the progressive teacher is one who changes his textbooks frequently. Each new publication properly comes into competition not only with those born the same year, but with all its extant elders. Altho there is a steady advance in the art of school-book making, it is not safe to assume in any particular case that the latest is the best. In fact, the books produced by the great educational publishing houses are so similar that it is usually impossible to put the finger upon one and say, "This is the best on the subject." Whatever may be the validity of the pragmatic test as applied to metaphysics or religion, there is no doubt about it in this case. The best textbook is the one that works best in a certain class and with a certain teacher. A book which makes a very favorable impression on first appearance may prove on trial to have serious defects in form or wording. Consequently the most that can be done in an article like the present is to introduce the new books to our readers with a few words of criticism by practical teachers in the various departments. Besides books for the use of students, we have included a number of books which are of interest to teachers from a professional standpoint. Many other works on philosophy, psychology and education and related studies will be found reviewed in other issues of THE INDEPENDENT of earlier and later date than this.

*The "First Folio" Shakespeare. Richard the Second. Richard the Third.* Edited by Charlotte Porter and Helen A. Clarke. *Henry the Fourth.* 2 volumes. Edited by Charlotte Porter. New York: T. Y. Crowell & Co. $1 each.

*How to Teach English Classics.* By C. S. Thomas. Houghton, Mifflin. 15 cents.

*History of American Literature.* By R. P. Halleck. American Book. $1.25.

*World Literature.* By Richard G. Moulton. Macmillan. $1.75.

*The Lawrence Reader and Speaker.* By Edwin G. Lawrence. Chicago: McClurg. $1.50.

*Language Series.* Book One and Two. Edited by R. C. Metcalf and A. L. Rafter. American Book Co. 40 and 60 cents.

*Prose Literature for Secondary Schools.* Edited by Margaret Ashum. Houghton, Mifflin. 80 cents.

*Historical Reader for Schools.* Edited by H. L. Brittain and J. G. Harris. American Book. 75 cents.

*Elson Grammar School Reader.* By W. H. Elson and C. Keck. Book I. Chicago: Scott, Foresman & Co. 50 cents.

*An Introduction to Shakespeare.* By H. N. Mac-Cracken, F. E. Pierce and W. H. Durham. Macmillan. 90 cents.

*English Literature during the Lifetime of Shakespeare.* By Felix E. Schelling. Holt. $2.30.

*The Evolution of Literature.* By A. S. Mackenzie. New York: T. Y. Crowell & Co. $2.50.

*Success in Literature.* By W. M. Colles and H. Cresswell. New York: Duffield. $1.25.

*Barbarian and Noble.* By M. F. Lansing. Ginn. 40 cents.

*The Writer.* By George L. Raymond and Post Wheeler. New York: Putnam. $1.

*The Progressive Road to Reading.* Book Four. By G. Burchill, W. L. Ettinger and E. D. Shimer. Silver, Burdett. 50 cents.

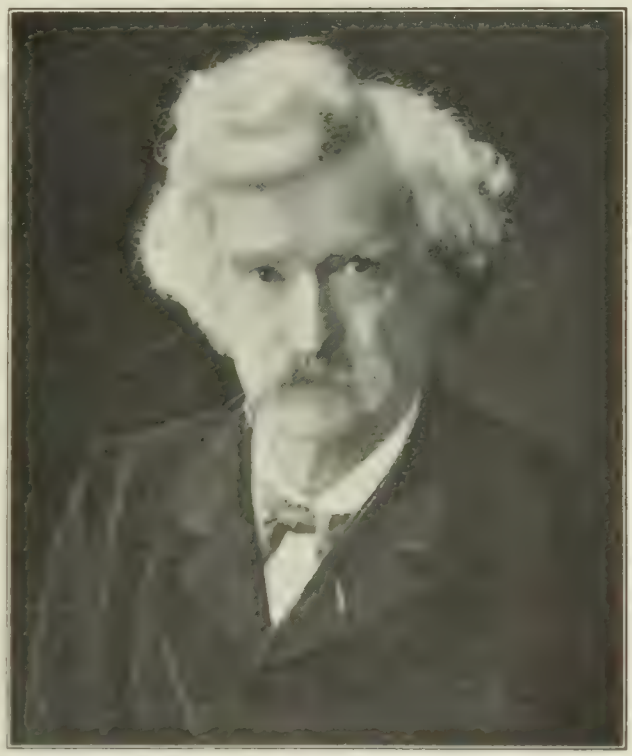
*A Mother Goose Reader.* By C. W. Mickens and L. Robinson. New York: Silver, Burdett. 36 cents.

*Story of the States Series. California the Golden.* By Rockwell D. Hunt. Silver, Burdett. 65 cents.

*High School Exercises in Grammar.* By Maude M. Frank. New York: Longmans, Green. 75 cents.

*Reading with Expression.* A Series of Eight Readers by James Baldwin and Ida C. Bender. First Reader, 30 cents; Second Reader, 35 cents; others, 45 cents each. American Book Co.

*The Riverside Readers.* Primer, First Reader, Second Reader. By J. H. Van Sickle, W. Seegmiller and F. Jenkins. 30, 35 and 40 cents. Houghton, Mifflin.



*Speaking and Writing.* Book II and III. By W. H. Maxwell, E. L. Johnston and M. D. Barnum. 23 and 25 cents. American Book Co.

*Eclectic Readings. The Story of Modern France.* By H. A. Guerber. 65 cents. *Makers and Defenders of America.* By Anna E. Foote. 65 cents. *Stories of the King and Don Quixote for Young People.* By James Baldwin. 50 cents each. American Book Co.

To judge from the proportion of texts on the subject interest in English composition seems to be running to debate or some form of public address. Academically Denney, Duncan and McKinney's *Argumentation and Debate* is worth consideration. One half or more of the book is devoted to illustrative material for briefing and analysis. The remainder consists of a concise statement of theory, which is on the whole clear and satisfactory, tho the introduction to argument is hardly discussed sufficiently. The feature of the book is the constant reference to the principles of legal evidence. Kleiser's *How to Argue and Win* is rather a series of talks than a textbook. Tho unsystematic, it includes a number of useful hints and suggestions with particular reference to the application of argument to various professions and occupations. Hence its value is largely practical and popular. Somewhat on the same order is Lawrence's *Speech-Making.* It contains, in the writer's words, "explicit instructions for the building and delivery of speeches," together with criticisms and discussions of some of the classical examples of oratory and a large number of classified illustrations. In the way of school or college manuals of general rhetoric Baldwin's *Composition Oral and Written,* an adaptation of his former "Writing and Speaking," tho it has been out for some time, should be called to the attention of teachers who are not already familiar with it, as another of the writer's successful attempts to treat the subject of composition under the two heads of clearness and interest. For the high school Brooks's *English Composition,* designed for the work of the first two years, insists upon the necessity of great flexibility of presentation on the part of the teacher and of constant revision and correction on the part of the pupil for anything like success in English. The book provides a wide range of theme-subjects and makes some effort to exercise the student's thought and observation. At the same time, when Mr. Brooks, in his preface, remarks that "expression can not be compelled, it must be coaxed," does he not inadvertently lay his finger on something false and artificial in the present conception of English instruction, which demands original

composition whether or no? Such a notion might seem to offer in itself a sufficient explanation of the unhappy results for which this instruction is so generally blamed. Mr. Howland, however, in his *Lessons in English,* thinks that the difficulty lies with the elementary teaching of the subject and attempts to correct the mistake in a pair of text-books, whose purpose is to give the pupil a proper start in a graded, reasonable and simple way.

Reading texts have multiplied so abundantly—the work of duplication and reduplication goes forward so merrily under the hands of instructors who have sought to win their scholastic spurs in this manner—that it is impossible to do much more than mention a few of the best editions. Holt's workmanlike and attractive series of *English Readings* has received a number of accessions, the most interesting of which are perhaps the *Robinson Crusoe* and the *Pilgrim's Progress.* Among other new numbers the *Riverside Literature Series* includes Howell's *Rise of Silas Lapham* in a handy form, tho the slightness of the introduction and the absence of notes make it hardly more than a reprint for rapid reading. In view of the startling ignorance of the Bible revealed by recent tests and college examinations, *The Old Testament Narrative* in this same series ought to be a valuable addition to preparatory material. It is an attempt to set out consecutively the history of Israel, with the omission of duplicated passages and a relegation of later variants to the foot of the page. The language is substantially that of the King James version corrected when in error by the results of modern textual scholarship. The notes are confined to necessary explanations of the text in the light of recent archæological investigation. A selection of the same material is to be had in the *Standard English Classics,* together with Stevenson's *Treasure Island* and Dickens's *David Copperfield,* each of which is preceded by a stimulating introduction. Thackeray's *English Humorists* in the *Lake Series* is very carefully annotated. Under the present method of editing it is Shakespeare who appears to receive the most perfunctory treatment—probably because the work has been done so often that even to the editor himself it can hardly appear otherwise than gratuitous. Perhaps the best of the year's output in this kind is Blakely's *Merchant of Venice,* in the *Eclectic English Classics,* which closes with some practical suggestions for the study of the play. Finally Gowan's *Characteristic Passages* illustrates English prose from Mallory to Chaucer in a set of selections which tho brief are admirably chosen. In connection with these texts should be mentioned Thomas's *How to Teach English Classics.* This little book, or, rather, pamphlet, has been prepared to accompany the reading required for entrance to college. The introduction deals with the principles of English teaching in general, whereupon each of the assignments for careful study is taken up in turn by questions, comments, suggestions and the like.

A NOTABLE AMERICAN
The portrait of Mark Twain, reproduced in Halleck's "History of American Literature"
(American Book Co.)

Of literary histories for school and college there seems to be something of a dearth this year. There is but one of special importance to chronicle—Halleck's *History of American Literature,*

which possesses much the same kind and degree of merit as the writer's history of English literature and deserves a similar success. The book has been seven years in making and displays a first hand study of the subject not only in its treatment of individual authors but also in its general perspectives. Every period is supplemented by a short review and a parallel survey of English literature for the same time, with references for further study historical and literary, while the volume is closed by a general appreciation and a supplementary reading list.

## Latin and Greek

*Latin and Greek in American Education.* With Symposia on the Value of Humanistic Studies. By Francis W. Kelsey. Macmillan. $1.25.

*Xenophon's Anabasis, Books I-IV.* Edited by M. W. Mather and J. W. Hewitt. Introduction, notes and vocabulary. American Book Company. $1.50.

*Sentence Connection in Tacitus.* By Clarence W. Mendell. Yale University Press. $1.25.

*A Latin Grammar.* By Harry Edwin Burton. Silver, Burdett. 90 cents.

*A Latin Primer.* By H. C. Nutting. American Book Co. 50 cents.

*Horace: Satires and Epistles.* With Introduction and Notes. Edited by Edward P. Morris. American Book Co. $1.25.

*Latin for Beginners.* By Benjamin L. D'Ooge. Ginn. $1.

*Two Latin Plays for High School Students.* By Susan Paxson. Ginn. 45 cents.

*The Eclogues of Baptista Mantuanus.* Edited by Wilfred P. Mustard. Johns Hopkins Press. $1.50.

*Live Issues in Classical Study.* By Karl Pomeroy Harrington. Boston: Ginn & Co. 75 cents.

*Index Verborum Vergilianus.* By Monroe Nichols Wetmore. Yale University Press. $4.

*The Iliad of Homer.* Translated into English Blank Verse by Arthur Gardner Lewis. Baker & Taylor. $1.75.

THE papers which Professor Kelsey brings together in his *Latin and Greek in American Education* have been published separately in educational reviews, but were well worth gathering up in the present form. There are some gratifying statistics in the first of these papers, reflecting an increased proportion of students of Latin in secondary schools, in spite of the publication in newspapers and magazines of so many articles hostile to classical studies during the period which shows the increase in the ratio of students of Latin. The position of Greek is less fortunate, and this fact is suggested, too, by the relatively small number of Greek texts issued by American publishers during the last year. Xenophon, however, is perennial; and one does well to note the *Anabasis, Books I-IV,* exceptionally well edited by Dr. Mather and Dr. Hewitt, and most attractive on the physical side, as in its illustrations. It is interesting to note Professor Kelsey's figures for Greek in the secondary schools; also it is sad. In 1889-90 there were 12,869 students; by 1898 the number was practically twice that; in 1910 the number had fallen to 10,739. In private schools the percentage of students in Greek was 6.61 per cent. in that year; in public schools only three-fourths of 1 per cent. In writing of the educational value of the ancient languages, Professor Kelsey quotes from Dean Vaughan:

"William Harvey, whose keenness and accuracy of observation led to the discovery of the circulation of blood, after many years devoted to the classics, gave five to the study of medicine, and his fitness was proved by his work."

As a more modern instance, he might have quoted from the record of Harvard College men in the Harvard Medical School, as reported by President Lowell. Men who begin specialization in scientific studies as undergraduates find it easier to attain good grades in the medical school during the first term, or the two first terms; then they are overtaken, if not surpassed, by students who gave their college time to the classics, to mathematical studies, etc., in following the old cultural ideal. Very entertaining, let us add, is the symposium on the value of classical studies incorporated in Professor Kelsey's volume.

But there are some students who still tread the way of the older learning—and some few of them are even so stubborn as to pass it on to others; and one of these, Dr. Clarence W. Mendell, has chosen for the subject of his doctrinal dissertation *Sentence Connection in Tacitus,* a topic somewhat too specialized to tempt us to linger over the quair of his thoro and painstaking labors. Secondary school teachers will find lucid and serviceable Dr. Nutting's *Primer* and Professor D'Ooge's *Latin for Beginners,* and Professor Burton's *Latin Grammar,* and in both school and college Professor Morris's *Horace* should prove its usefulness. Of a decided novelty is Susan Paxson's *Two Latin Plays:* a little volume of original comedies which offer "a contribution to the evolution of the . . . problem: 'How can we make this Latin *interesting?*'" Interesting, one may add, and also (or therefore) real.

That classical study is not dead, after all, and not everywhere sleeping, is the contention of Prof. Karl Pomeroy Harrington's contention in *Live Issues,* and we hope that his little book may have a wide reading among the teachers of the "dead" languages. The Middletown professor is an optimist, and his optimism is grounded—or shall we say, risking a bad pun, *rooted?* Professor Harrington in the final chapter of his book gives us a summary of the answers to a question put to a number of American educators in regard to the use of translations. One of these considered "the practice advantageous for college students, provided the translation is a good one." We are justified, then, in spite of the fact that "horses" are frowned upon by the many among teachers, in including here a note of the fact that a new translation of the *Iliad* in English blank verse comes to us, bearing the name of Arthur Gardner Lewis as translator. We have not read every line of the twenty-four books, but the translator seems to have attained the end which he proposed—"a rendition which should be smooth, harmonious and pleasing to the ear, so far as consistent with an adequate and literal interpretation"—a rendition both less Latinized and less conventional than Bryant's, and untrammeled by the exigencies of rime.

THE SPLITTING SAW

From C. G. Wheeler's "Shorter Course in Woodworking" (Putnam)

## German

LAOKOON: Lessing, Herder, Goethe. Selections edited by *William Guild Howard.* Holt. $1.50. KARL LEBRECHT IMMERMANN. A Study in German Romantic Fiction. By *Allen Wilson Porterfield.* Lemcke & Buechner. GERMAN STORIES. By *Ludwig Lewisohn.* Holt. 75 cents. HEIMATKUNDE IN GERMAN LESSONS. By *M. B. Lambert.* Holt. 45 cents. AN INTRODUCTION TO GERMAN. By *Edward Prokosch.* Holt. $1.10. DEUTSCH. A German First Reader. *Edited by Philip Schuyler Allen.* Holt. 70 cents. LUISE'S DER TALIS-MAN. *Edited by Otto Manthey-Zorn.* Ginn. 45 cents.

DEUTSCHE GEDICHTE. *Edited by Camillo von Klenze.* 90 cents. LUDWIG'S DER ERBFÖRSTER. *Edited by Morton C. Stewart.* Holt. 50 cents. ERNSTES UND HEITERES. *Edited by Josefa Schrakamp.* 35 cents. EKKEHARD'S AUDIFAX UND HADUMOTH. *Edited by Charles Hart Handschin and William F. Luebke.* American Book Co. 60 cents.

DEUTSCHE WIRTSCHAFT. Selections from Loening's Grundzüge and from Arndt's Deutschlands Stellung. *Edited by John A. Bole.* MEISSNER'S MÄRCHEN VON HEUTE. *Edited by Morton C. Stewart.* GUTZKOW'S URIEL ACOSTA. *Edited by S. W. Cutting and A. C. von Noé.* Holt. 35 cents each.

A MOST important contribution to German scholarship in America is made by Dr. Howard, of Harvard, in his *Laokoon.* The simplification of Lessing's text may be a daring procedure, but it is judiciously made, Goethe and Herder have been drawn upon for interpretation or criticism, and the editor's account of Laocoön in poetry and sculpture, of Lessing and his friends, of "Poetic" painting and "Pictorial" poetry, is at once erudite and critically vital. The commentary will prove valuable to the college student who is commanded to use this book in his German studies: but the essays which precede text and commentary have a much greater significance than attaches to the ordinary "introduction." They are for every student of esthetics (including literary criticism) to take account of, and even to enjoy. An exercise in Germanics that is from no conceivable standpoint enjoyable, however, is the doctorial dissertation on Immermann—a minor romanticist—from the Columbia University Press. Its composition cannot even have afforded pleasure to the learned Ph.D. who strung it together. But it is a "substantial contribution," etc., and in the face of academic certification what else can be said?

Mr. Lewisohn, too, is concerned with esthetics, and in his volume on *German*

*Style* offers to the advanced student of German prose "a method of approach to the study of its formal beauty." In a few pages of fluent introduction, he sketches the general characteristics of German prose, the historical outline, and the theory of style in German letters. He is well qualified for his task and the bulk of his little book is given up to selections from Luther, Lessing, Goethe, Heine and Nietzsche, upon which the "advanced student" is to try his esthetic teeth.

For the school classroom the tables of idioms, and the exercises in the use thereof, collected by Mr. Lambert, of the Richmond Hill High School, will have a practical value upon which, since the book is one deserving praise, we need not insist. And so, unless appearances deceive us, will have Professor Prokosch's *Introduction to German:* a grammar for the beginner. Most attractive is the form of the *Deutsche Gedichte,* in a second edition, revised, and of the *Erbförster,* a play called naturalistic in its day and generation. And no less adapted to school use, at least, is another volume of tales by modern Germans—*Ernstes und Heiteres.* This last, one of the American Book Company regiment, is reduced to light marching equipment—scarcely any critical apparatus: albeit a vocabulary, such as is dispensed with in the Holt brigade. Uniform with *Ernstes* is an abridgment of Ekkehard's novel, *Audifax und Hadumoth.* A series of questions on the text, in German, is a feature of the one book, a set of German exercises adds to the value of the latter.

## Romance Languages

*Molière's Le Bourgeois Gentilhomme.* Edited by M. Levi. Holt. 35 cents.
*Molière's Les Femmes Savantes.* Edited by Charles A. Eggert. American Book Co. 40 cents.
*Taine's Les Origines de la France Contemporaine.* Edited by J. F. L. Raschen. American Book Co. 60 cents.
*Joan of Arc* (French Composition). By H. A. Guerber. American Book Co. 30 cents.
*Historical French Reader.* By Félix Weill. American Book Co. 40 cents.
*Easy Standard French.* By Victor E. François. American Book Co. 40 cents.
*The Poetry of Victor Hugo.* Edited by John Squair and Pelham Edgar. Ginn. 90 cents.
*Concordanza delle Rime di Francesco Petrarca.* Compiled by Kenneth McKenzie. Yale University Press. $10.
*Ibañez's La Barraca.* Edited by Hayward Kenniston. Holt. 90 cents.
*Spanish Composition.* By J. P. Crawford. Holt. 75 cents.
*Essentials of Spanish Grammar.* By Samuel Garner. American Book Co. $1.
*French Grammar for Schools and Colleges.* By W. Olmsted and Arthur Gordon. Holt. $1.40.
*El Romancero Espanol.* Por Ramón Menendez Pidal. Hispanic Society of America. $1.25.
*Brief Grammar of the Portuguese Language.* By John C. Branner. Holt. $1.25.
*A Complete Grammar of Esperanto.* By Ivy Kellerman. Heath. $1.25.

MOLIERE still holds his own as an author of texts for the students of French: Holt publishes his *Bourgeois Gentilhomme* in most attractive form; the American Book Company his *Femmes Savantes* no less attractively, tho with less of critical apparatus. Uniform with the volume just named is a new edition of selections from Taine's *Origines,* containing a very brief biographical sketch of the author. Among other French books for the classroom is H. A. Guerber's *Joan of Arc,* a collection of passages of biography for translation from English into French. The volume is intended as a bridge "between the customary grammar work and selected passages from the works of various writers" and is provided with notes and a vocabulary. Out of the common running is Prof. Félix Weill's *Historical French Reader,* offering selections from Froissart, Fénelon, Michelet, Rousseau, Voltaire, Taine, etc., and from the "Chanson de Roland." Each selection is complete in itself, or is complemented by a short introduction. Illustrated from photographs and illuminated by scholarship, this is a book full of promise of usefulness. *Easy Standard French,* by Victor E. François, is another collection of anecdotes and fragments from a variety of writers unstaled by school use: Lesage, Bernardin de Saint-Pierre, Beaumarchais, Chateaubriand, Coppée, Anatole France, Mérimée, Flaubert, About, Loti, and Margueritte among them. One is especially glad to receive a selection of *The Poetry of Victor Hugo* for the reason that Americans have persistently erred in attributing greatness to Hugo the novelist rather than to Hugo the poet.

In the field of Spanish letters we have Ibañez's *Barraca,* uncommonly well edited by Hayward Kenniston, of Harvard University, and preceded by a portrait of the novelist, after Sorolla, as frontispiece. An elementary *Spanish Composition,* prepared by Dr. J. P. W. Crawford, and two Spanish grammars—Dr. Samuel

Garner's *Essentials* and Olmsted and Gordon's more extended course—attest the fact that the study of Spanish is increasingly popular at school and university. All of these works impress us as being intelligently executed, and are altogether practical. More interesting for the advanced student is the study of *El Romancero Español,* by Ramón Menéndez Pidal—lectures given at Columbia University and published by the Hispanic Society. Señor Pidal is a professor of Madrid, and discusses learnedly the origin, character and transmission of the great body of Spanish ballad verse.

Portuguese is a less followed branch of study in American institutions, but if America is to have her share of South American trade, a considerable number of us must improve our somewhat impressionistic knowledge of the language and syntax. For the beginner, Dr. J. C. Branner's *Brief Grammar of the Portuguese Language* may be confidently recommended.

And where, if not here among the Romance languages, is one to catalog the businesslike *Grammar of Esperanto,* signed by Ivy Kellerman, A. M., Ph. D.?

## Mathematics and Physical Science

*Second Course in Algebra.* By Herbert E. Hawkes, William A. Lewby and Frank C. Touton. Ginn. $1.

*First Year Algebra.* By William J. Milne. American Book Co. 80 cents.

*Vocational School Mathematics.* By Robert L. Short and William H. Elson. Heath. Book I. $1.

*Elements of Descriptive Geometry.* By Albert E. Church. American Book Co. $2.25.

*A College Text-book of Physics.* By Arthur L. Kimball. Holt. $2.75.

*Chemistry of Food and Nutrition.* By Henry C. Sherman. Macmillan. $1.50.

*Laboratory Outline of Organic Chemistry.* Century. $1.50.

*Physico-Chemical Tables (Physical and Analytical Chemistry).* By John Castell-Evans. Volume II. Longmans. $12.

The much debated question of whether mathematical textbooks shall be written by university or high school men is sensibly solved in the case of the *Second Course in Algebra* by the co-operation of both, Professor Hawkes of Columbia working with two instructors in the Kansas City Central High School in the preparation of this volume, which follows the "First Course in Algebra," by the same authors. It is a compact and well ordered textbook, in which an interesting attempt has been made to add human interest to the subject by a few brief portraits of distinguished mathematicians and some notes as to the historical importance of their discoveries.

*Milne's Algebra* is intended to provide a small textbook for the first year's work in the high school. Its distinctive feature is the simplification of the process of acquiring the new conceptions of algebra by introducing them one at a time. Thus the fundamental operations are first carried thru with positive numbers alone, and only then are negative numbers introduced. The concrete problems are usually varied, timely and interesting. There is a chapter on graphical methods which the author states may be omitted. But we hope that no teacher will take advantge of the permission, for the ability to perceive at once what a graph means is becoming more and more important to every reader.

Short and Elson, in their *Secondary School Mathematics,* make a bold attempt to combine the mathematical sciences and to train the student in the use of arithmetical, algebraic and geometrical methods at the same time; claiming as a result of this method "increased interest and power of analysis on the part of the learner and greater accuracy in results." It should be always recognized that the dividing lines between the sciences are largely arbitrary and due to the accidents of their historical development, but in how far it is advisable now to maintain the distinction in education is a question that will have to be decided by long continued tests in the schoolroom. The publication of this book gives an opportunity for trying the method under favorable auspices. Among its other novelties is the recognition of the fact that a majority of our high school students are girls by including in the practical exercises a large proportion of problems coming from the kitchen, and dealing especially with the composition of food.

As a contrast to such a venture into new fields, we may mention next a textbook which for about forty-five years has been in use in the United States Military Academy and elsewhere, Church's *Elements of Descriptive Geometry.* This has now been revised and modernized by Mr. C. M. Bartlett, of the University of Michigan, and new figures have been

drawn. It occurs to us that a work of this kind could be made more interesting and tangible by the free use of half-tone illustrations from objects having a definite relation to the source of light and point of sight.

The new *College Textbook of Physics*, and Deschanel in being so largely descriptive, but we do not mean to imply that it is antiquated in matter or neglects the mathematical side of the subject. There are more formulæ and problems in it than most students will want, and the author is undoubtedly right in holding

A MAN AT ARMS IN THE TIME OF HENRY II
One of the illustrations of H. W. Elson's "Guide to English History"
(Baker & Taylor)

by Professor Kimball, of Amherst, represents a reaction against the dominant tendency of the times to treat physics as a mere branch of mathematics. This large and readable volume of nearly 700 pages reminds one of the days of Ganot that "there are many minds that do not easily grasp mathematical reasoning even of a simple sort," and that these should not be shut out entirely from a knowledge of the science.

A book like *Sherman's Chemistry of*

*Food and Nutrition* occupies a somewhat peculiar position. It is necessarily part organic chemistry and part hygiene. It is too difficult for general use as a class textbook, and hardly complete and comprehensive enough for a reference work. But for any one, teacher or student, who wants a concise and authoritative account of modern views of the composition and utilization of food, this volume is exceptionally valuable. It is evident from the wild theories and erratic practices of food faddists which find their way into publicity, that few people realize how much has been accomplished within the last two years toward discovering the real scientific principles of digestion and dietetics. The time has passed when all proteins looked alike to us, and when carbohydrates were conveniently determined "by difference." Professor Sherman's summaries of the results of recent experimental investigations on the digestive processes and on the balance of energy will be a revelation, and a most important and interesting revelation, to the general reader and the old school physician.

## Biology, Geology, Geography

*Essentials of Biology.* By George William Hunter. American Book Co. $1.25.

*Laboratory Manual in Biology.* By Richard W. Sharpe. American Book Co. 75 cents.

*The Animals and Man.* By V. L. Kellogg. Holt. $1.25.

*Botany for High Schools.* By G. F. Atkinson. Holt. $1.25.

*Elements of Zoology.* By C. B. and G. C. Davenport. Macmillan. $1.25.

*Morphology of Gymnosperms.* By J. M. Coulter and C. J. Chamberlain. University of Chicago Press. $1.12.

*Rural Hygiene.* By Henry N. Ogden. Macmillan. $1.50.

*Influence of Geographic Environment.* By Ellen Churchill Semple. Holt. $3.

*Elements of Geology.* By E. Blackwelder and H. H. Barrows. American Book Co. $1.40.

*The Continents and Their People. North America.* By J. F. and A. H. Chamberlain. Macmillan. 55 cents.

*Around the World.* Book V. By S. W. C. Tolman. New York: Silver, Burdett. 60 cents.

*Commercial Geography.* By Albert P. Brigham. Ginn. $1.25.

*How the World Is Housed.* By F. G. Carpenter. American Book. 60 cents.

*Industrial Studies: United States.* By Nellie B. Allen. Ginn. 60 cents.

*Nature Study by Grades.* By Horace H. Cummings. American Book Co. 75 cents.

*A Guide for Laboratory and Field Studies in Botany.* By William Gould Vinal. Philadelphia: Blakiston. 60 cents.

*A History of the Earth's Crust: Geology.* By H. B. Woodward. *Biology.* By L. C. Miall. *Anthropology.* By A. C. Haddon. *Astronomy.* By G. Forbes. *Chemistry.* By H. E. Tropp (2 vols.) Putnam. 75 cents each.

*Introduction to Vertebrate Embryology.* By A. M. Reese. Putnam. $1.50.

Several important biological books for high school students have been published during the year. Hunter's *Essentials of Biology* is a great advance from his earlier "Elements" in that biological principles are better correlated on a physiological basis and finally applied to the biology of man. The book is intended as a text in first year of high schools. Sharpe's *Laboratory Manual* presents fifty-six important principles of biology in the form of problems to be solved in the laboratory. The problems will mean most to students if the laboratory work is arranged in close association with Hunter's text book. Kellogg's *Animals and Man* is composed of the most important parts of the author's well-known "Elementary Zoology" and "First Lessons in Zoology," together with some new chapters on human biology, including man's structure, functions and relations to animals. In short, the book is is in line with the recent movements toward applying high school biology more directly to human life and studying human biology from the point of view of general biology, particularly on its zoological side. Seven of the new chapters were written by Prof. Isabel McCracken, of Stanford University, but her name does not appear on the title page. As chapters on human structure and physiology they are satisfactory, but they lack that correlation with the zoological chapters which would make the book a unified study for a year's course. However, human physiology in such relation to zoology is certainly far more effective than as an entirely separate course. Atkinson's *Botany* is intended for a year's course in the early part of the high school curriculum, but will probably be found difficult enough for even the last year of many good schools. Growth and work of plants are kept in the foreground in the first part of the book, while general morphology, classification, ecology and economics of the great groups of plants occupy the second part. Davenport's *Elements of Zoology* is a revision of the "Introduction," which was published about ten years ago. The natural history features which made that book well known have been retained, the laboratory directions have been omitted, and there are many

noticeable additions in the lines of anatomy and physiology of animals. In short, the revised edition is a general zoology.

Coulter and Chamberlain's *Morphology of Gymnosperms* is a university textbook of botany, and is especially interesting to the advanced student because much of it has been written from the standpoint of the personal investigations of the authors.

Ogden's *Rural Hygiene* is of incalculable importance to the great country population of America. For years we have had a flood of books advising the farmer how to preserve the health of his cattle, horses and pigs; but the health of the farmer and his family has been almost forgotten. Professor Ogden has treated his subject in a broad and comprehensive manner, including sanitary buildings, water supply, sewage disposal, pure and wholesome foods, infectious diseases and healthful personal living. It is beyond question the most valuable country life book of the year.

Cummings's *Nature Study* is the third of a useful series for elementary schools. In addition to the usual type of animal and plant study, the book contains much important physical nature study in relation to daily life.

Blackwelder and Barrow's *Geology* is an elementary textbook which well presents the essential facts of the history of the earth.

Semple's *Geographic Environment* is a restatement of the principles of Ratzel's "Anthropo-Geography," which has been available only in German, modified and supplemented by much original research by the writer. Prominent geographers have already welcomed the work as very useful to American students; and much of it is exceedingly interesting to biologists who care for problems of distribution and ecology of organisms.

Chamberlain's *Continents and Their People: North America,* is a supplementary reader intended for use with textbooks of geography. It is the first of a series in preparation. Tolman's *Around the World* is a geographical reader for fifth and sixth grades.

That Brigham's *Commercial Geography* is up to date or even ahead of it is shown by the first page containing a map of the Panama Canal as completed. The book is carefully illustrated, and makes good use of maps and graphs in the presentation of statistics.

## History

*A Short History of Europe from the Fall of the Roman Empire to the Fall of the Eastern Empire.* By C. S. Terry. Dutton. $1.25

*A New School Atlas of Modern History.* By Ramsay Muir. Holt. $1.25.

*A General Sketch of Political History.* By Arthur D. Innes. Macmillan. $1.50.

*A Guide to English History.* By Henry William Elson. Baker & Taylor. $1.25.

*A History of the United States for Schools.* By Andrew C. McLaughlin and Claude Halstead Van Tyne. Appleton. $1.

*California the Golden.* By Rockwell D. Hunt. Silver, Burdett. 65 cents.

THE number of elementary books on history which jostle one another for position on the teacher's desk is astounding; but the end to the making of them is not yet in sight. Two new texts and an atlas have come to us from across the water. Professor Terry, of Aberdeen, sends us a short history of medieval Europe. This volume opens, after the fashion of medieval histories, with a discussion of the origins of races, and especially those which invaded Rome. Then follows a well-balanced account of the invasions, the conversion of the barbarians, the foundation of the Holy Roman Empire, the rise of Islam, the work of the Northmen, the conflict of empire and papacy, the Crusades, the Hundred Years' War, Hapsburg imperialism, Papal schism and conciliar movement, and the fall of the Eastern empire. It is written in true English style, that is, it is a political history, and so far as one can gather from the text, the people of Europe for about a thousand years were busy with nothing but invasions, feudal enterprises and papal conflicts. The views of the author are traditional, but the compact form of the book will make it useful to those who, for one reason and another, feel that they ought to have a hasty review of the Middle Ages. Professor Terry recommends in his preface Prof. Ramsay Muir's *New School Atlas of Modern Europe,* and it will doubtless prove a handy companion to any text dealing with Europe from the barbarian invasions down to our day. It is strange indeed that the English teaching world has not been able to produce a general atlas comparable to Putzger's; and while Professor Muir's little

work is hardly up to the German standard, it ought to find a hearty reception from history teachers who are not content to slur over their political geography. Between its lids, the political history and the expansion of Europe from the barbarian invasions to our day is covered by a series of well-balanced and clearly printed maps. Our third over-sea contributor, Mr. Arthur Innes, whose volume on the Tudors some years ago showed that he could do a serious piece of critical work, now issues *A General Sketch of Political History from the Earliest Times,* covering in 400 pages, as has been remarked somewhere, universal history from the fall of man to the fall of Port Arthur. The proportions of the book are satisfactory and the style is clear and straightforward. Whoever has occasion to run over such a broad sweep in a short space of time will find this book handy. From these dry and severe texts it is some relief, if not an advantage, to turn to H. W. Elson's *Guide to English History.* This little book, in about 200 pages, surveys the history of England from prehistoric times to the South African Federation. It is written in a light and easy style that will be pleasing to children and not uninforming to persons of mature mind. Altho the authors of the new *History of the United States for Schools* are head professors in the universities of Chicago and Michigan, they have not fallen into the defect of overloading their book with erudition. The style is admirably simple and straightforward, and does not demand too much previous knowledge or literary acumen of the pupil. The illustrations are numerous and to the point, many of them from contemporary prints and cartoons. Unusual attention is given to industrial development and the westward movement.

## Political Science and Economics

*Introduction to Political Science.* By R. G. Gettell. Ginn. $2.
*Government and Politics in the United States.* By W. B. Guitteau. Houghton, Mifflin. $1.
*The Revision and Amendment of State Constitutions.* By Walter F. Dodd. Baltimore: Johns Hopkins Press. $2.
*History of Economic Thought.* By Lewis H. Haney. Macmillan. $2.
*Readings on American State Government.* Edited by Paul G. Reinsch. Ginn. $2.75.

In political science and economics there are three or four new books that deserve the attention of teachers and students. *Professor Gettell's Introduction to Political Science* is a general survey of those themes which systematists of the German type have fallen into the habit of calling "political science." It covers the origin and nature of the state, the character of law, the nature and content of international law, the three great branches of government, local and colonial government, and the ends or functions of the state. In arrangement, presentation and accuracy of statement the book leaves little to be desired, and the author seems to have carefully weighed all the best authorities in his field. The point of view of the book is distinctly conservative, and he believes that it is the business of Teutonic nations to civilize the rest of the earth. The teacher who is sure of the value of covering such a broad field in a college course could not find a better text than this volume by Professor Gettell. To the already large number of textbooks on American government available for secondary schools, Dr. W. B. Guitteau, superintendent of the Toledo schools, has added another in his *Government and Politics in the United States.* Following the recommendations of the New England teachers, he begins with local government and advances upward. His method of treatment is both historical and systematic.

In common with the more recent writers on the subject, he recognizes the place of the party in our political system, and he takes into consideration the functions as well as the structure of government. He makes use of the first authorities and has adapted all that "apparatus" which seems to be necessary for high school books: extensive lists of readings, questions and exercises, pictures and diagrams, bold type and sideheads. The book is literally jammed with facts and figures, and this is perhaps the most severe criticism that may be made of it. The study of American State government, a much neglected subject, is now made easier by Dr. W. F. Dodd's *Revision and Amendment of State Constitutions.* This volume is based upon scholarly and critical research, and, as far as it goes, will supplant Jameson's great work on constitutional conventions. Dr. Dodd discusses the historical development of the constitutional convention, surveys the various methods devised for the ordinary amendment of constitutions, and examines the working of the constitutional referendum. This is one of the most important contributions made in recent years to the study of American institutions, and it deserves well at the hands of scholars, and, in particular, of the public. Teachers of economics will welcome Prof. L. H. Haney's *History of Economic Thought,* because there is not available in English in systematic form any account of the historical development of political economy. Professor Haney's volume falls into four parts: a general introduction on the nature and importance of economic history; a brief summary of economics previous to the physiocrats; a study of the evolution of economics as a science, beginning with the physiocrats, running thru the various divagations down to the recent troubles of the Austrian metaphysicians; and a general account of the recent schools of economic thought. The volume is critical and is based upon a careful analysis of the best literature on the subject. No important theme seems to be overlooked, and if any one wishes to go deeper he is aided by an excellent documentation. The spirit of the volume is, on the whole, optimistic, and after plowing his way thru an endless confusion of contradictions, the author arrives at the hopeful conclusion that never since the heyday of English classicism has a generation of economists found so united and common a way of looking at economic problems, or so large a body of generally accepted principles. Professor Reinsch, of Wisconsin, follows his "Readings in American Federal Government" with a similar volume on *American State Government.* He has culled from a wide range of sources, Governors' messages, Congressional addresses, propaganda pamphlets, magazine articles and newspaper editorials, illustrative of the practical workings of all branches of State administration. Here will be found Taft on the enforcement of law, La Follette on direct nominations, Hughes on conservation, Beard on the Oklahoma Constitution, Folk on bribery, and White on Folk. It is a useful volume to the citizen as well as the teacher.

## Philosophy and Education

*Cyclopedia of Education.* Vol. I. Edited by Paul Monroe. Macmillan. $5.

*Educational Problems.* By G. Stanley Hall. Appleton's. 2 vols. $7.50.

*Manual of Mental and Physical Tests.* By Guy Montrose Whipple. Baltimore: Warwick & York. $2.50.

*Introduction to Psychology.* By Robert M. Yerkes. Holt. $1.60.

*An Introductory Psychology.* By M. S. Read. Ginn. $1.

*Educational Values.* By William Chandler Bagley. Macmillan. $1.10.

*A Text-Book in the Principles of Education.* By Ernest Norton Henderson. Macmillan. $1.75.

*Animal Intelligence.* Edward L. Thorndike. Macmillan. $1.60.

*A Beginner's History of Philosophy.* By H. E. Cushman. 2 vols. Houghton, Mifflin. $1.60 each.

*Annals of Educational Progress in 1910.* By John Palmer Garber. Lippincott. $1.25.

*Administration of the College Curriculum.* By William T. Foster. Houghton, Mifflin. $1.50.

*Training of Teachers for Secondary Schools.* By John F. Brown. Macmillan. $1.25.

*Open-Air Schools.* By Leonard P. Ayres. Doubleday, Page. $1.20.

*The Teaching of Agriculture in the High School.* By G. A. Bricker. Macmillan. $1.

*Systematic Moral Education.* By John King Clark. New York: A. S. Barnes Co. $1.

*The Career of the Child.* By Maximilian P. E. Groszmann. Boston: R. G. Badger. $2.50.

*Riverside Educational Monographs. The Ideal Teacher.* By G. H. Palmer. 35 cents. *Problem of Vocational Education.* By David Snedden. 35 cents. *The Recitation.* By G. H. Betts. 60 cents. *The Teacher's Philosophy in and Out of School.* By W. DeW. Hyde. 35 cents. *Teaching Poetry in the Grades.* By Margaret W. Haliburton and Agnes G. Smith. 60 cents. Houghton, Mifflin Co.

*A History of Education in the United States Since the Civil War.* By Charles Franklin Thwing Houghton, Mifflin. $1.25.

*Principles of Education.* By W. Franklin Jones. Macmillan. $1.10.

*Kindergarten at Home.* By V. M. Hillyer. Baker & Taylor Co. $1.25.

*Education as Growth.* By L. H. Jones. Ginn. $1.25.

*Idealism in Education.* By Herman H. Horne. Macmillan. $1.25.

*Public Education in California.* By John Swett. American Book Co. $1.
*Craftsmanship in Teaching.* By William Chandler Bagley. Macmillan. $1.10.
*Plutarch on Education.* By Charles William Super. Syracuse, N. Y.: C. W. Bardeen. $1.
*Short History of Ethics.* By R. A. P. Rogers. Macmillan. $1.10.
*The Higher Education as a Training for Business.* By Harry Pratt Judson. University of Chicago Press. 55 cents.
*The Unfolding of Personality as the Chief Aim of Education.* By Thiselton Mark. University of Chicago Press. $1.07.

THE publication of the first volume of *Cyclopedia of Education,* edited by Paul Monroe, marks, we believe, the dawning of a new educational epoch in this country. The fact that one thousand experts contribute to the making of the five substantial volumes which will constitute this edition and that the first volume alone contains about one thousand title entries indicates the wide range of human interests now focalized on the problems of education. Home and church, shop, court and farm are bringing new responsibilities and opportunities to the school. Science and art, commerce, industry and agriculture, in fact every constructively social form of human interest must be reckoned with by the modern educator. The cyclopedia is planned not merely to make all this wealth of material easily accessible to the teacher or lay reader but to present it in highly organized form. The cyclopedia is designed to be a series of treatises as well as a reference work. The scientific spirit, range of interest, and degree of organization embodied in this undertaking fitly symbolize and indicate the coming into a larger self-consciousness on the part of the teaching profession.

Volume I contains 654 pages and the titles run from Abacus to Chrysostrom. The illustrations are numerous and effective. The bibliographies and cross references greatly add to the value of the work. The character of the volume may, perhaps, best be made concrete by a fair-

A BOSTON CLASS IN BASKETMAKING
From Leonard P. Ayres's "Open Air Schools" (Doubleday, Page)

ly intimate knowledge of a single article and for this purpose the one by Helen Keller on the Blind has been chosen.

Perhaps the most significant contribution to the field of education by a single author for the period covered in this review is the copious two volume work entitled *Educational Problems* by G. Stanley Hall. These volumes are similar in external appearance to the author's well known work on "Adolescence." The present volumes cover, however, a wider range of problems and will probably be of more direct service to the

teacher. The author's style exhibits the same fervidity and, at times, almost ecstatic character of the "Adolescence." There is also to be noted the tendency to employ technical terms of rare usage. This tendency and the lack of system in the arrangement handicap the reader somewhat, but they are more than compensated for, perhaps, by the richness of material offered and the enthusiasm with which the author's views are presented. As in his earlier works, salvation from our pedagogic ills is to be obtained by suitable utilization of ancestral tendencies.

A CHINESE CLASS IN TRIGONOMETRY
From Monroe's "Cyclopedia of Education" (Macmillan)

"The school is to shorten the stages by which the child repeats the history of the race. Perhaps none of these essential stages should be entirely omitted for the fullest and most harmonistic culture. Some of them need to reverberate only faintly and but once to do their great work of stimulus. . . . Often even the germs of the sins and errors of all the past must be made to glow up for a moment, for the vestiges of evil are thus burned out, while at the same time their conflagration alone can arouse the next highest powers which control or, it may be, repress them. Others need to be betoned with emphasis lest something vital, that is part of man's precious legacy from the past, be lost to life, for the best in us is often only the most sublimated and transfigured."

The topics of the separate chapters, twenty-four in all, are as follows: Volume I, The Pedagogy of the Kindergarten, of Music, of Sex, Moral Education, Industrial Education, Children's Lies, The Religious Training of Children and the Sunday School, The Educational Value of Dancing and Pantomime; Volume II, The Budding Girl, Missionary Pedagogy, Special Child-Welfare Agencies Outside the School, Preventive and Constructive Movements, Sunday Observance, The German Teacher Teaches Pedagogy of Modern Languages, of History, of Elementary Mathematics, of Reading, of Drawing, School Geography, Pedagogy and the Press, Some Defects of Our Public Schools, The American High School, Civic Education. These books contain a remarkably rich array of material bearing upon the problems concerned, and they ought to prove of great value to all persons interested in educational problems.

Prof. Whipple, of Cornell University, has contributed during the year a *Manual of Mental and Physical Tests*. The tests are carefully standardized for use in schools or elsewhere, and the necessary apparatus has been made easily accessible. The Binet-Simon "intelligence" tests and the "Aussage" or "testimony" tests are included in the list. The former are being widely employed for the classification of children into subnormal, normal and supernormal groups. A chapter on statistical methods is included and the bibliographies are complete and conveniently arranged.

Professor Yerkes, in his *Introductory to Psychology*, has departed from the usual classification of topics followed in introduced textbooks on psychology and has divided the body of his text into these five divisions: Psychology as Description of Consciousness, as the History of Consciousness, as Generalization, as Explanation, Psychology and the Control of Mental Life. The author gives considerable attention to the elucidation of his views as to psychical causation and the pedagogy of psychology. The phenomena chosen to support his view of psychical causation seem to be those most favorable to this position, and the work presupposes that the beginner will bring more information than the average one may possess. Read's *Introductory Psychology* gives a clear and simple treatment of the subject, and is not intended to be an original contribution.

In *Educational Values* Professor Bagley has forcefully presented a series of distinctions which should be of service in pointing the way to a wider and richer approach to the problem of the control of human nature. The teacher is to seek to build up not merely specific habits or principles and ideas, but also ideals, or emotionalized standards, prejudices or tastes, and attitudes or perspectives. The method of the teacher should vary to suit the function in question, and the functions mentioned above should be mechanisms for promoting social values.

Professor Henderson has written his *Principles of Education* in an endeavor "to present in a systematic way the outlines of a theory of education from the point of view of evolution." "Education as a Factor in Organic and Social Evolution" is the title of the first and possibly more philosophical portion of his discussion. The second part deals with psychological problems, and the third part with educational agencies. The philosophical type of treatment and the knowledge of biological and philosophical problems presupposed make this a difficult book for the beginner. For the advanced student its carefully drawn distinctions, wide grasp of details and broad and constructive treatment will be of undoubted value.

Cushman's *History of Philosophy* is intended as a handbook of essentials for the student. The various philosophical positions are simply and directly stated, and the connection of thought movements with the total social and political environments is clearly indicated.

Professor Thorndike has republished in a single volume his monographs on *Animal Intelligence* and the "Mental Life of the Monkey." The volume also includes two new chapters, one of them being a discussion of the relations of human and animal intelligence. The publication was rendered practically necessary by the exhaustion of the supplies of the monographs referred to above.

*Annals of Educational Progress in 1910* is a welcome addition to the educational library. It summarizes the wide field of education, and will be of great value to those who have not the opportunity for extensive reading on educational subjects. There would naturally be some advantages in having a board of experts instead of a single editor, but the work is, on the whole, very well done. *The Administration of the College Curriculum,* by President William T. Foster, of Reed College, is divided into an historical portion and a critical one. In the former the evolution of the elective system is discussed, and in the latter the results of careful statistical studies bearing on the problems of the elective curriculum are presented. In *The Training of Teachers for Secondary Schools* Dr. John F. Brown presents the results of his study of German schools during his year as exchange teacher of English in the Oberrealschule of the Franckesche Stiftungen at Halle a S., and also discusses the problem of training for secondary teachers in this country. Dr. Brown favors professional training in college and a seminar practice year after graduation as a prerequisite to teaching. *Open Air Schools,* by Leonard P. Ayres, forcibly presents the need of a wider establishment of such schools by exhibiting the success of those now existing. *Teaching of Agriculture in the High School* applies the principles of apperception, interest, etc., to the teaching of agricultural subjects.

REAR ARCHES MISSION SAN JUAN CAPISTRANO
From Hunt's "California the Golden" (Silver, Burdett)

several interesting lesson plants are presented. *Systematic Moral Education*, by John King Clark, is a very suggestive outline of instruction by means of the presentation of moral problems directly growing out of typical school situations. In the *Career of the Child*, Dr. Groszmann presents a wealth of material, not very systematically arranged, perhaps, relating to the school life of the child. Dr. Snedden's monograph on the *Problem of Vocational Education* in the Riverside Series, emphasizes the insistence of popular demand and present needs for vocational education, and tentatively indicates the solution of some of the numerous problems involved.

In *The Teacher's Philosophy* William DeWitt Hyde gives some genial counsel to the pedagog:

"The tests of a good teacher are five. First: Is my interest in my work so contagious that my pupils catch from me an eager interest in what we are doing together? . . . Second: Is my work thoro and resourceful? . . . Third: Do I get at the individuality of my students? . . . Fourth: Do I treat them, and train them to treat each other, never as mere things or means to ends; but always as persons, with rights, aims, interests, aspirations, which I heartily respect and sympathetically share? . . . Fifth: Am I so reverent toward fact, so obedient to law, that thru me fact and law speak and act with an authority which my students instinctively recognize and obey?" The teacher should combine in himself Epicurean happiness, Stoic fortitude, Platonic serenity, Aristotelian proportion and Christian devotion.

## Music

*Voice Training for School Children.* By Frank R. Rix. New York: Barnes & Co. 50 cents.
*Mind and Voice.* By S. S. Curry. Boston: Expression Co. $1 50.
*Art Song Cycles.* Books I and II. By W. O. Miessner and F. C. Fox. New York: Silver, Burdett. $1.25.
*School Hymnal.* By Hollis Dann. American Book Co. 50 cents.
*The Eleanor Smith Music Primer.* By Eleanor Smith. American Book Co. 25 cents.
*Art Songs for High Schools.* By Will Earhart. American Book Co. 80 cents.
*Resonance in Singing and Speaking.* By Thomas Fillebrown. Boston: Oliver Ditson Co.
*Harmonic Part-Writing.* By William A. White. Silver, Burdett. $1.50.
*Glee and Chorus Book.* By J. E. Ne Collins. American Book Co. 65 cents.
*The New Normal Music Course.* Silver, Burdett. Book I, 32 cents; Book II, 40 cents; Book III, 50 cents.

Mr. Frank R. Rix's work as director of music in the public schools of New York City, where he has assuredly a vast field for observation, has convinced him that the care and cultivation of children's voices lies within the capacity and understanding of the class teacher, with competent help and supervision, and he has therefore prepared a short, concise, practical manual to supply the needful directions for the teacher's study and guidance in plain and untechnical language. Without wasting words in theorizing about the mechanism and physiology of voice production and kindred subjects, he points out common faults and then gives positive and simple directions for cultivating the voice in the classrooms of the public schools. His little book is imbued with common sense and should prove in use abundantly helpful. Dr. Curry has long "stood for" sane and scientific methods in the training of the voice, for speaking as well as singing. His new book is a compendium of the best principles and methods in vocal training, and is replete with exercises which he rightly calls the necessary means of demonstration. A carefully made index adds to the usefulness of the book. Cycles of songs of the senses, of insects and of half a dozen foreign lands, all for young children, make up another of those thoroly delightful song-books, of which several in recent years have made older music lovers wish they might have had something half so good in their childhood and early school days. Miss Fox's verses are dainty and pretty. Mr. Miessner's musical settings for them are both picturesque and artistic—the accompaniments of some a bit difficult for the average amateur pianist, perhaps, but they are worth mastering. Dann's *School Hymnal* is a good, but not at all unusual, collection of songs suitable for high schools, normal schools and colleges. It includes hymns and chants that are well liked by young people, and the best of the patriotic and national songs, also some of the familiar folk and plantation songs. The *Eleanor Smith Music Primer* is a collection of first-year songs, childlike in spirit, very simple in structure. It is printed in large, clear type and notation. Another good collection of songs for high schools is that made by Mr. Will Earhart, supervisor of music at Richmond, Ind., whose principle of selection was to include songs not only for their value in training his pupils in music, but also for their artistic content.

Dr. Fillebrown's technical treatise, which forms the latest volume in the "Music Students' Library," really consists in a classification of the principles separately advocated by many teachers or writers in the last decade, but here for the first time systematically arranged and applied in a practical method. The book is one of uncommon value for the amateur as well as for the professional not above learning, and contains lessons of value for teachers and advanced pupils of singing and oratory, especially younger teachers whose experience as yet is limited.

## Miscellaneous

*Physical Training in and out of School.* By W. T Harris. Syracuse, N. Y.: C. W. Bardeen. 30 cents.

*Cookery for Little Girls.* By O. H. Foster. Duffield. 75 cents.

*A Shorter Course in Woodworking.* A Practical Manual for Home and School. By Charles G. Wheeler. Putnam. $1.50.

*Handbook of Woodwork and Carpentry for Teachers and Normal Schools.* By Charles A. King. American Book Co. $1.

# From Master to Master

BY SOLOMON SOLIS COHEN

[Rabbi Abba ben Aioub, also called Abba Arika (the Tall), traced his descent from Shimei, brother of King David. He died in the year 247 of the common era at Sura in Babylon, where he had founded the great Rabbinic Academy. He is rarely indicated by name in the Talmud, most of his teachings being quoted with the formula "Rab (Master) said." "Magog" is Russia.]

I.

*From the Master of the Law.*

Nigh to his end the Master lay;
In grief and awe
His pupils gathered silent by his bed,
To hear the Law

Taught by his dying lips, whom men
Were wont to call
The goodliest fruitage of a noble vine—
Abba the Tall.

Thru East and West all Israel knew
His learning's fame;
"Master," the single word that any said,
Who spake his name.

And like an open book his life
From youth to age;
Pure as the water summoned from the rock,
The Torah's page.

Calmly, his pupils gathered close,
He waited death;
Discoursing still of high and wondrous themes,
With ebbing breath

A pause.—"I go," he said, "and none
Ere all be done,
And ye, with fervent crossed eyes, hail as
'The Lord is ONE.'

To this, my last, my solemn charge
Incline your ears;
*Take heed, O man, they rate no woman's tear;*
*God counts her tears!*"

II.

*To the Master of the Pack.*

Two and thrice five the centuries' tale
Since Abba died;
Kings, races, conquering empires rise—They strut
Their day of pride,

And pass. Only the Word endures
Forevermore;
And the sworn folk that bear it, age to age,
And shore to shore.

And with it, over all the earth,
The treasured page,
Close writ with precious comment of the scribe
And saint and sage.

And thus in never-broken chain
From sire to son,
In every land, the dying Master's charge
Is handed on.

Even there, in Magog's land of night,
The nations' shame,
Where a crowned coward cheers the mob to deeds
Without a name,

And the sworn folk draw breath of fear,
Like wolf tracked sheep
Take heed, O Master of the pack! *God sees—*
*And women weep!*

PHILADELPHIA

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Charles W. Beach
130 Fulton Street — New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.56 a year extra. To Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Controller Bay's Shore Front

THE controversy about certain lands on the shore of Controller Bay, in Alaska, originated in charges, set forth in House resolutions of inquiry and otherwise, that the President by means of a secret order and at the solicitation of his brother, Charles, had enabled a greedy capitalist syndicate to get possession of the shore front of the only available harbor near the great Bering River coal fields. It was alleged that a young woman who had been permitted to inspect the official papers had found in them a letter directly connecting Charles P. Taft with what was called a conspiracy. There is convincing evidence that no such letter ever existed. This evidence is presented in the remarkable message that President Taft has sent to Congress, a message in which the history of the Controller Bay lands is exhaustively reviewed. It seems to us, after a careful examination of the whole matter, that this message is a conclusive answer to all the charges and a satisfactory defense of the action taken. It should be borne in mind that the filed applications of Ryan (who asserted that he represented a new railroad company) cover only a small part of the bay's shore front; that they are still pending; that, if granted, they would give the owner of the land no monopoly of the harbor; that a large part of the shore front would be reserved by law for the Government, and that the proposed railroad terminal would be subject to regulation by the Government, because the Government would own the three miles of flats to be spanned by the railway's trestle work or wharves.

There is not the slightest indication that Charles P. Taft ever knew this man Ryan, had any interests in Alaska, or had ever heard of Controller Bay; nor is there any warrant for a belief that President Taft had in mind anything except the development of Alaska's resources in an honest and reasonable manner. He declined to order the withdrawal from the Chugach Forest of only the 320 acres for which Ryan desired to make application, preferring that 12,800 acres should be withdrawn, in order that there might be no local monopoly. If so much were restored to the public domain, the laws would give opportunities to other applicants and would prevent exclusive control by the reservation of alternate tracts.

Mr. Roosevelt has taken part in the controversy, expressing the opinion that Mr. Taft ought never to have ordered the restoration of any part of the Chugach Forest or Reserve to the public domain. In the course of a long article he refers to the efforts made by himself, Secretary Garfield and Forester Pinchot in 1906 and 1907 to prevent monopolization of Alaska's natural resources. But Mr. Taft, in his message, points out that when the Chugach National Forest, on Forester Pinchot's recommendation, was created by President Roosevelt, in July, 1907, there were expressly excepted from its area several tracts; that one of these, 33,000 acres, extended along the shore of Valdez Bay, and that upon another "the Copper River Railway Company, owned by the Morgan-Guggenheim syndicate," promptly established its terminal and built up the well known terminal town of Cordova. It is alleged in the charges relating to the Controller Bay lands, that Ryan (altho he denies it) represented this Morgan-Guggenheim syndicate. Mr. Pinchot, like Mr. Roosevelt,

severely criticises Mr. Taft's course. Mr. Taft's message permits an inference that both of them may have forgotten parts of the early history of the Chugach Reserve.

We believe that Mr. Taft, Mr. Roosevelt and Mr. Pinchot sincerely and earnestly desire that monopoly in Alaska shall be prevented, and that the Territory's resources shall be developed and utilized with due regard to the public interest. One of these gentlemen may think that the methods he would use are better than those which the others prefer, but all have the same good purpose in mind. Mr. Roosevelt deplores the opposition of "the men who in the name of virtue insist upon what is impractical." Mr. Taft may say that these are the men who denounce the restoration of the Controller Bay shore front to the public domain. Mr. Roosevelt urges the enactment of laws which, "while preserving the Government's absolute control, will offer a sufficient premium to make it worth while for big moneyed concerns to develop the coal fields." They can be developed, he adds, "only by big corporations, and big corporations will not and ought not to undertake such a business unless they are to have adequate profits." Mr. Taft may say that he opened the Controller Bay shore front (under conditions which, in his judgment, must prevent harbor monopoly and provide for reasonable control by the Government) because he was convinced that corporations of large resources could not otherwise be induced to build a railroad terminal there.

While these gentlemen may differ as to the methods which should be used under our present laws, they agree about the imperative need of new legislation. All of them favor such a system of leases and royalties as both Mr. Roosevelt and Mr. Taft have advocated in official message. If the American people look for the cause of unsatisfactory conditions in Alaska they will find it in the failure of Congress to do what ought to have been done long ago. Before the adjournment of the present special session, Congress should enact reasonable laws relating to the lands and mineral resources of Alaska. But who, reviewing the almost shameful record of Congress as to this subject for a long time past, will predict that the needed legislation will be enacted within the coming three or four years?

## The Farm Colony for Tramps

It is only 1911, and the year is only a little more than half gone. Since 1865 the tramp, who has been a nuisance and a danger in every civilized land since Menes assumed the administration of united Egypt, has been in the United States a pest of the big and virulent sort —quite in keeping with American self-esteem, American graft, American brag, American trusts and the American boss. For forty-five years sensible people have been agreed that this nuisance ought to be abated, and well-informed people have known how it could be. Not waiting for the rounding out of a full half century of discussion and dawdling, the New York Legislature has enacted and Governor Dix has signed a measure to inaugurate the one method of accomplishing this end which experience has shown to be feasible. So far as known, the new law has nothing but experience, common sense and righteous purpose back of it. It embodies substantially the scheme urged by the late Edmund Kelly, as put into shape by Robert W. Hebbard, secretary of the State Board of Charities, and looked after at Albany by Assemblyman Chanler. So, in a single generation a great commonwealth gets to the point of attacking a big task in the obviously right way, which has all along been known to be the right way! As American political evolution goes, this is "going some."

The law establishes a State farm colony "for the detention, humane discipline, instruction and reformation" of male adults committed as tramps or vagrants from any part of the State. A board of seven managers will be appointed by the Governor, and they will appoint a superintendent. It is expected that abandoned farm lands owned by the State will be utilized for the experiment.

The word "reformation" is put into the description of the function of the colony to please those tender-hearted moralists of both sexes who rejoice over one "bum" who professes repentance, more than over ninety-nine self-supporting workmen who carry their pay envelope home to their wives. The records of five

continents for six thousand years may be searched in vain for a properly authenticated case of reformed tramp. But the farm colonies of Germany are an adequate and businesslike proof that tramps can be kept from tramping. They can be rounded up, kept off the roads, off the park benches, out of the dives and police cells, and out of the polling places on election days; they can also be compelled to wash and to comb, and to do enough work to diminish appreciably the burden of their maintenance. Maintained they are and must be, so long as the community is unprepared to deal with them according to Oliver Wendell Holmes's prescription for the choice of ancestors. Farm colonies do not pay in the commercial sense; but if the cost which unrestricted vagrancy saddles upon a community be fully reckoned up, they pay well.

The philosophy of this subject is simple and is perfectly understood by all who make an unprejudiced study of it. The amount and differentiation of vagrancy is determined, like that division of labor which Adam Smith described, by the extent of the market. Every State and every town in it gets the amount and quality of vagrancy that it stands ready to pay for. Nobody but the professional agitator and the uninformed confounds the vagrant with the working man out of a job. The unemployed workingman looks upon unemployment as a crushing misfortune. The tramp looks upon work as an unendurable infliction. The Chanler law discriminates at this point. The unemployed are not to be sent to the farm colony. Its tender mercies are extended only to the true vagrant. Its adequacy to eliminate this variety of the human species will be demonstrated if it is put into operation and conducted in good faith, and with reasonable administrative ability.

## The Passing of a Business-Man Type

THE fight between the public and the "interests," as it is waged in the United States, takes forms that grow out of original and picturesque conditions of American life. Every government commission and every individual investigator that comes from Europe to study American trusts and "trust busting" lands here with a notion that nothing exactly like our problem exists elsewhere, altho it is because problems in a general way like ours have arisen elsewhere that the investigators come to look us over.

There is enough of truth in the foreign view of our social evolution to make it worth our own while now and then to observe the process and to analyze it with reasonable care. There are factors in it now which will have disappeared within another generation, and with their dropping out our problems of economic public policy will probably be less provocative of the elemental passions than they now are, if not essentially less difficult.

The "interests," so called, altho they are legally, as in popular description, identified with corporate organizations, have in nearly every instance been built up by forceful individuals whose boldness and ruthlessness have not been inferior to their vision. With few exceptions the most aggressive and the most successful of the constructive sort of men in American business have been uneducated in the academic sense. They have sprung from vigorous but unpolished stock, and have grown up in rough, often distinctly brutal surroundings. With such start and under such conditions they have not, as a rule, acquired an excessive sensitiveness to the minor infelicities of life nor an abnormal consideration for the rights and the happiness of their fellow men. More often than not they have boasted of their ignorance, despised college education, and in their secret hearts preferred shirt sleeves to decent apparel, even after they have taken to wearing diamond studs.

Such men have been a product of the pioneer life and frontier conditions that are fast passing, and can never return. They have been the rank growth of primal opportunity and lawless freedom. Their rank egotism, their mining camp and cowboy manners, their obtuseness to such facts as constitute the traditions, conventions, refinements and moral restraints of long-settled communities, must happily pass away with the raw conditions that produced them.

In contrast with such exaggerations of crass individualism, community feel-

ing, public interest, a sense of civic obligation, are products of that long living together, that interbreeding and that co-operation in an hundred enterprises which are the conditions and processes of civilization. These conditions create a folk-thought and folk-ways. They create manners and refinements, decencies and morals. They create a respect for what other people have found out as well as what we have found out for ourselves; a respect, therefore, for education, its traditions and methods.

In the historical evolution of the United States old settlements with their conventions and folk-feelings on the one hand, frontiers, ranches, lumber camps and mining camps on the other hand, have jostled one another. While rank individualism has grown amazingly in one region, civic obligation and the idealism of civilization have found nourishment and have waxed strong in various local areas like New England, where have grown and lived those sectional civilizations that have been the most characteristic and perhaps the most worthy and beautiful American achievements thus far.

In the light of these social facts it is plain that the conflict between the public and the "interests" is more than an economic antagonism. From the first there has been in it an intensity of bitterness which springs from differences of attitude toward the most cherished traditions of civilized man. The most irritating factor all along has been—to put it in the frankest way—the egregiously bad manners, the brutal contempt for elemental moralities, the vulgar egotism and the ridicule of education which a large proportion of the most successful, self-made business men of the United States have hitherto displayed. "The public be damned" has been not only their motto, but also their self-revelation. Their day has happily gone by. The community has grown upon and will soon have obliterated the spawning grounds of their brutal individualism. The business men of tomorrow will have to be, and will be, civilized beings, men of education and urbanity, respectful of the moralities and decencies of life and therefore reasonably considerate of their fellow beings. With their succession the fight between the "interests" and the public will have been won. The "interests" will be for the public and will be controlled by the public. They will not be for and controlled by the ruthless lords of lumber camps and slaughter houses, of coal mines and private property railroads.

## Simplified Spelling

Occasionally The Independent receives a letter from some new subscriber who is offended because we print *tho* for *though,* and *thru* for *through,* but the number is much less of the complainants than we might have expected. We presume that our intelligent readers —and it is for such that we try to cater —for the most part see the sense of the desired reform, and we hope that many of them wish we carried our own practice of it somewhat further. We ourselves wish to, but it is not wise to lead too far in advance of the following army.

That the scholars and teachers are with us appears in the action just taken by the Modern Foreign Language Conference of the National Educational Association meeting in San Francisco. It has unanimously endorsed simplified spelling, not a dissenting voice being raised. A resolution was passed recommending a conference between the Simplified Spelling Board of the United States and the Simplified Spelling Society of Great Britain with a view to united action. It was also suggested that the Simplified Spelling Board seek to secure Governmental co-operation if practicable. President Roosevelt's adoption in his White House correspondence was an admirable and far-seeing decision, but was too early to be maintained. Is it not time now for our Government to take the lead with the people by printing all its documents in a more decent spelling?

Perhaps not yet. That conference between the American and the English societies needs to do some preliminary work, so that it may be wisely decided under what rules simplification can take place. The two societies are not in full agreement, altho in complete harmony as to the need. The American Simplified Spelling Board has begun with cer-

tain recommendations, in a list of words that surely need rectification, so as to accustom the people to the idea of reform, and make them ready for a wise radical reform when it may come. The English Simplified Spelling Society, on the other hand, makes as yet no recommendations for general use, but waits till its members can perfect universal rules for the reform. Thus they have at present no propaganda; there is in Great Britain no journal like THE INDEPENDENT, and no large publishers like Funk & Wagnalls that make use of it to any extent. The two societies also differ in their principles of reform, so far as formulated by them. The English Board is the more radically phonetic. It would have only one letter, or digraph, for one sound—thus long *a* might always be *ae*, and long *o* be *oe*. With only twenty-six letters it is necessary to select digraphs for many of the forty or fifty different sounds in the language. It will be seen that this is a radical principle, and pure phonetics thus adopted would very much change the looks of an English page, altho not so much as would the ultimate scientific phonetic alphabet with its new characters.

The American Simplified Spelling Board has adopted thus far a method which is more of a compromise with the accepted English orthography. It asks what are the prevalent rules of English spelling and seeks to eliminate exceptions to them. Thus, it is a prevalent rule that a long vowel in final accented syllables is indicated by a silent final *e*, as in *mate, mete, mite, mote* and *mute;* why not let the rule *prevale?* The Board is going over the dictionary to learn what the present principles of spelling and pronunciation are, and what the exceptions. As another example, it is a prevalent rule which after a short vowel in an accented antepenult does not double the following consonant, as in *animal, eminent;* why then not drop the unnecessary *n* in *cannibal?* It will be evident that the American method makes much fewer changes than the English, and leaves the page less strange to the reader. Those wishing to keep in touch with the various phases of the movement may procure free literature on the subject from the Simplified Spelling Board, 1 Madison avenue, New York.

One of these days we shall have one purely phonetic alphabet of forty or fifty letters for all languages. But that is in the future. It will require the long labor of an international commission. Meanwhile the representatives of English-speaking people on both sides of the sea should meet and agree on the principles of the reform which they seek to accomplish, and which so sadly needs to be achieved. Children cry for it.

## The High School and the College

A FEW years ago in the rivalry between the high school and the college, the college had the better of it, and a commission with President Eliot at its head "articulated" the high school on the college. It was the needs of the college which was in mind, and the high schools were authoritatively told what they should teach and how much. The colleges set the standard; they dictated the subjects, even selecting the texts in English literature to be taught. The college was master; the high school was servant.

But it could not last, and the session of the National Educational Association at San Francisco records the rebellion. And why should they not rebel? The high school has had a tremendous growth in these few years. In the two last decades high school attendance has increased almost fourfold. The high school is the people's university. The overwhelming majority of boys and girls do not go beyond it. If but one in twenty of the graduates of the high school goes to college it is too much to ask that the high school curriculum should be dictated for the advantage of the 5 per cent. There must be considered also the advantage of the very large number who are unable to complete the high school course.

The special committee appointed by the National Educational Association last year accordingly gave the high school the precedence, and bade the college follow after. They hold to the fifteen educational units, but not for the college primarily. They make much of vocational instruction in mechanic arts, agriculture or domestic science, which they regard as "rational elements in the education of all boys and girls, and es-

pecially of those who have not as yet chosen their vocations." Accordingly they allow from the total fifteen units four units for such vocational instruction, but they are careful to add, "or for additional academic work." So there is a choice left, and the curriculum should be flexible. The courses are divided into majors and minors, and each student is expected to complete two majors of three units each, and one minor of two units. This leaves room for the vocational studies, and for such other studies as will be required by the boys and girls who expect to go to college. We take it that the full fifteen units now required for entrance to college would not include the four vocational units.

Beyond question it would be an advantage to every student entering college if he or she has had a course in agriculture, the mechanic arts or domestic science, but he needs a good deal more. He cannot now give to these studies the four units allowed in the high school course, and the colleges cannot well accept them in making up the complement without lowering the standard. The chief purpose of the college is not vocational but cultural. And yet the chief purpose of the high school is not to fit youth for college, nor is it simply for culture; it should be for both. Those who do not go beyond the high school should be allowed to pursue the vocational studies, so as to be better farmers, mechanics and home-keepers; but other special studies should be provided for those who need them. The committee well says:

"It ought to be possible for any strong high school at any time to introduce into its curriculum any subject that either meets the peculiar needs of the community, or that appears to be the most appropriate vehicle for teachers of pronounced individuality."

The college faculties will not all agree with the recommendation of the committee as to its method of "articulation." It would have any student who has satisfactorily completed a well planned high school course admitted to college on its fifteen units. As we understand it any fifteen units would be sufficient. This may be questioned. Yet the argument offered is strong. It is declared with truth that many graduates of the high school are prevented from going to college because the college does not recognize their needs as shown in the courses taken by them in the high school. The committee seriously objects to the iron rule of the present college prescription for admission, which too much crowds the boys whose own needs require some other studies, while at the same time it prevents the more important development of the high school on its own independent lines.

The high school is the most democratic institution we possess. It is the chief real education of the most of our people. Real education begins in the high school. Its tremendous development will not be stayed, and it must supply what the bulk of the people need. To be sure it does not give a complete education, and the chief leaders of public life, our thinkers and guides, will be those pre-eminently who have passed from the high school on to the college and university. Education has no limit, but for the bulk of the people the high school will be their university, and democracy will rest on it. For a comparatively small number of its graduates of exceptional ambition or opportunity it will open a narrow door by which to pass up to higher halls of study, but for the multitude it will open a broad gateway into the activities of life. No limit can be set to its development, certainly no limit can be set by the college.

## Beautiful Streets

An American highway ought to be, and can be, the most beautiful part of the country. It should not only be neat and wholesome, but the trees should be selected with a good deal more wisdom and planted with more care than they generally are. There certainly is good reason why so many people like to plant the sugar maple. It is an ideal tree for shade, and the associations connected with this tree are homeful every way; but there is no tree more likely to get into disorder and partial decay than the sugar maple when neglected. It must be understandingly planted and trimmed, and then it must be judiciously let alone. It will not endure being sawed and hacked at by the professional trimmer. If set so that the roots will not have too much water to dispose of, and if the limbs are trimmed to about the right

light for permanence, a row of these maples constitutes a most charming feature in road landscape. This, however, is wofully rare. If trimmed after it has reached much size the exudation of sweet sap draws insects, and the bark of the tree is very sensitive to hot sun rays. On the whole we can hardly recommend this tree for general street planting.

A very much better maple, in all ways, is the Norway. This tree is characterized by a milky juice, that is acrid and disagreeable to all sorts of insects and worms. The tree is almost absolutely immune to the attacks of vermin. Beside this, the growth is astoundingly fast, at least one-third faster than the sugar maple. The shade is dense, from the foliage of very large leaves, rich green in the summer and canary yellow in the fall. In all ways this is a conspicuous tree, of fine proportions, and elegant shape. It may be fairly placed at the head of all street trees, wherever maples will thrive at all. It will endure moist soil about as well as the swamp maple, and it is not quickly affected by drought. There is but one caution, and that is the tree must have room. In the street they should stand at least 40 feet apart. This space will be rapidly filled up, altho fillers may be used for temporary shade, and removed later.

This matter of fillers is understood in orchards, where the grower has a selection of small growing, early bearing apple trees, which he can place between the more lasting sorts, to yield fruit for a few years, while the standard trees are growing. The same plan may be adopted with street trees judiciously. Select with care the trees that are to be permanent, and set them far enough apart, so that when grown there shall be no collision of limbs; then place between them trees of rapid growth, that can be removed when no longer needed. This will avoid the necessity for mutilating your large trees after they have interlocked their limbs.

Close after the Norway maple there is another tree too seldom used in our streets, but which has about all the qualifications for a perfect shade tree. The American linden or basswood has superb foliage, a fine spread of limbs, the densest kind of shade, and is naturally healthy in all soils. It does not like solid, sticky clay very well, and it does not like to be abused with artificial manures. Give it any natural soil, and it will develop into a shade tree to be enjoyed and proud of. Beside this, its blossoming is something one may go far to enjoy. The bees adore the basswood. They will work in it all night, making more honey from its nectar than from any other American tree. On the whole, Americans can do nothing better than to multiply the basswoods in their streets. The maple does not heal over easily, but a basswood will repair a wound of large size, and will recover its strength. Its wood is soft, and worthless for fires. For this reason there is a common prejudice against the tree. It deserves, however, a place at the very head of the American flora.

Of course, where the oaks are at home an oak avenue is something hard to beat. Nearly all the oaks are tough fibred, will endure trimming, and make admirable shade. The form of the leaf is so varied and so finely cut by nature as to be very attractive. Among the very best of the oaks for street planting is the Scarlet. This tree is very tenacious of life, is broad spreading, and, while not really scarlet at any time, is is certainly very handsome in its autumn coloring. Where trees are wanted to hold their foliage very late, the English or Royal oak will also serve admirably.

However, this matter must be considered, that for the most part we do not need trees in the street to give shade very early in the spring or very late in the autumn. We want them to shelter us from the hot suns of midsummer. An ideal street tree would leaf out about middle May, and drop its foliage about mid-October. The white ash would be perfect for this purpose, only that it is rather slow growing, and its limbs are inclined to be rather open. However, we have seen a row of white ash in a highway, that could hardly be surpassed for either shade or beauty. The butternut is another of these late developing trees, that again drops its foliage early in autumn. There certainly is no objection to nut trees in the street. We are inclined to think that it would be a kind policy that would multiply them everywhere for the young folk. The hickories are

simply superb for street trees, but are slow growing—not very slow, yet not as fast as the lindens and maples. Nothing could be more beautiful in foliage, or more prolific of fruit than the walnut.

There is a native American tree of great beauty, in the legume family, which carries the absurd name of Kentucky coffee tree. It is a remarkable tree for lawns on account of its delightful spread of limbs, and it would serve just as well for the street, only that the sexes must be carefully distinguished. The female grows as erect as a Lombardy poplar, while only the male is a good shade tree. Its blossoms are as spicy as they are profuse. The stateliness of the magnolia acuminata secures it attention, and would warrant its planting in suburban avenues. It is very erect in growing and very symmetrical in its limb growth. It endures a wound, and its foliage is simply superb. The flowers are large yellow, but fall very speedily after opening.

The beech and the elm are two more of our trees that ought to be used with more freedom: the beech where dense shade is needed and quiet rules; the elm for great avenues, where the vista should be open. The beech should not be trimmed more than 10 feet high, and underneath is the very ideal spot for children to enjoy themselves at midday. It is the tree for side streets; the elm is the tree for avenues; equally superb in its own place, there is no comparison to be drawn.

Our American streets should be planted with the understanding that they belong to the people, and are not simply strips of land to permit the most rapid transit from one point to another. The term good roads should mean not only good drives and well drained highways for vehicles, but delightful parks, where the trees are conspicuously perfect. We have suggested a few of the more valuable sorts for making our streets charming. We particularly desire to see introduced varieties that will not easily become diseased, or exhibit decay instead of life. The maples almost everywhere are unfortunately giving us examples of what ought to be removed. It does not pay to doctor a lot of diseased trees, or to tolerate them after they have got below real value. If you have an old and decrepit avenue, first set between them something more desirable, mulch these and stake them, and, as soon as they have begun to give shade, cut out the old wreckage for fuel. Our object is accomplished if we have designated a few sorts that will make our streets most beautiful, in the shortest space of time.

## From College Windows

As a complement to the article which we publish in this week's issue on "Harvard under Two Presidents," let us add a few sentences from two letters received from Cambridge. One of these was written by an official of the university, the second by a professor: each of them after a reading of our proof sheets. The professor is not sure that the average member of the Faculty has yet fully made up his mind about the new president. Speaking from the standpoint of the teacher of literature, he questions whether courses in political economy and government are not at the present moment "university fads." The other critic writes that "the article as a whole strikes him as accurate," but wishes that the new plan for the choice of electives had been mentioned—a plan which aims to oblige the student to base his choice of studies upon something better than whim, and to give to the college course something of unity. Certainly this is an important development. "I wish also," adds the kindly critic, "that you had made some reference to the new alternative plan of admission, for it will undoubtedly bring the university much closer to the public high school boy than ever before. It is noteworthy that about 50 per cent. of the boys admitted under the new plan come from schools outside of New England, and that some of the best examinations were passed by boys from small high schools in the West, who probably could not have come to Harvard under the old plan." This is a most desirable consummation from any point of view, and one which THE INDEPENDENT has not failed to bring before its readers. An editorial on the subject, entitled "Entrance Tests—New Plan," was published some months ago (LXX, 214). But there is one more point

raised by the letter writer, and this time it is more nearly a question of opinion. The criticism is made that too much emphasis is laid on "the sporting element in college, with its mediocre or low scholarship." To quote at length:

"I am afraid a reader might infer that the majority of students loaf, spending too much time on athletics or in conviviality. As a matter of fact, a student cannot cut as much as he pleases, nor as much as he dares. There will always be loafers, of course, but they are not the rule, and are getting to be more and more the exception. The large number of serious minded fellows who are working their way thru college and hence have low grades are certainly to be taken into account. The sporting element is, when all is said and done, a very small proportion of the college."

THE INDEPENDENT is incorrigibly optimistic and therefore takes especial pleasure in printing this letter. But our chief interest is not in the loafer: rather in those who might do distinguished work but for the toleration of the student of low ideals by the academic authorities, and the reduction of education—not chiefly at Harvard by any means—to the lowest common denominator.

**A Big Defense Fund**

It is an extraordinary appeal which Secretary Morrison, of the American Federation of Labor, has made to the two million members of the labor unions to raise a fund of $500,000 to defend J. J. McNamara, accused of dynamiting with accessory murder. We do not see how that much money could be honestly spent in a legal defense, or half of it. He ought to have even justice, acquitted if innocent and punished if guilty. Whether he is innocent or guilty we do not know, but it is not impossible that he is guilty, and if guilty all labor union men ought to want him convicted. It is no part of their interest to have him escape if he is not innocent, and the amount of the defense fund sought for is such as to suggest the thought that it is desired to secure acquittal whether or no. Somebody is guilty of the numerous series of dynamiting offenses of which the one for which Mr. McNamara is to be tried is one of the most shocking on record, and for which some one ought to be punished. It would be unfortunate if it should be made to seem as if labor union men did not want any one punished who kills "scabs" or who destroys buildings and bridges on which union labor is not employed.

**Noisy and Noisome**

It was the high-toned, aristocratic Conservatives, representatives of wealth and ancient dignities, that howled and yelled and would not allow the Premier of the Empire, the chief representative of the people, the highest officer of the Empire, the man who tells the King what to do, to make an opening address in reporting the amended Veto bill which had been adopted by the House of Lords. How years ago they fumed and fretted at the rude discourtesy of the Irish representatives in the days of Parnell, and now, as representing and defending the peers, they outdid the Irish in noise and insult, with their cries of "Traitor," until the Speaker was obliged to close the session. One would think they had learned from the suffragets that violence may serve where argument fails. We cannot imagine such a scene allowed in our House of Representatives. The Speaker would call the disturbers to order speedily, and if they persisted the sergeant-at-arms would arrest the offender. And these are the Unionists, the paragons of culture, peers or backers of peers, like Lord Hugh Cecil, who represents Oxford University, or Sir Edward Carson, who is sent by Dublin University, that thus disgraced themselves and the chamber by a riot as bad as anything that Vienna could show. If we judge Englishmen aright this disturbance and insult will create such disgust and indignation as will make it easier for the Cabinet to proceed with their program and force their bill thru the House of Lords.

**Sliced Literature**

THE INDEPENDENT has its faults, as we are frequently reminded by our kind readers. But whenever these reminders come in too thick we take a pharasaical delight in reflecting that there is one crime of which we are not guilty; that is, we never slice up our articles to sandwich in advertisements. This pernicious custom seriously

impairs the esteem that we owe to our esteemed contemporaries. We read a page of a good story, fictioinal or factual, and turn over the leaf to continue it only to find that we are plunged into the midst of quite another story. This also looks inviting, and we begin it only to be again interrupted by another change of subject. It is as bad as reading thru the dictionary. If one of the stories we have started happens to be so interesting as to overcome our natural inclination to throw down the magazine in disgust, we attempt to follow the clue at the bottom, "Continued on page 36," dodging automobiles and revolvers, until we hit the trail again and get a few more paragraphs before we are told to seek the rest on page 42. It is as exasperating as a dinner at which, after we have tasted the soup, the waiter takes it away to bring it back again after the fish, and when we have eaten a bit of the roast we are told that we can have the rest of it later, part after the salad and part after the ice cream. It is an insult to an author to print his article in such a way as to destroy the continuity that he has labored to secure. The hero is cut off in his prime by a safety razor, and the most entrancing love scene interrupted by talk about toilet powders and garters. Why will not these publishers reduce their pages to a convenient size and keep their advertising in its legitimate place, letting the reader mix it in to suit himself. It is, of course, a matter of taste, but for our own part, if the editor of THE INDEPENDENT gets hard up, he will surrender one side of his house to an advertisement of Castoria before he will contaminate his reading matter pages.

**An Aerotechnic Institute**

The University of Paris has the honor of being the first in the world to establish a distinct and completely equipped department for research and training in the arts of aviation. The site chosen adjoins the plain of St. Cyr, near Versailles, used as the exercise ground of the military school. Here laboratories, shops and hangars have been erected and apparatus installed for experimenting on a large scale with different kinds of motors, propellers and planes under various air currents. A straight trolley track nearly a mile long with electric power affords an opportunity to test the efficiency of different models without danger of accident. The University owes the Institute to the generosity of Henry Deutsch (de la Meurthe), one of the foremost patrons of French aeronautics, who donated $100,000 for the plant and $3,000 for its running expenses. It is his desire that its facilities should be open to all, inventors and professors, scientists and mechanics, and that theory and practice should here co-operate in the conquest of the air. As M. Steeg, Minister of Public Instruction, said in inaugurating the Intitute:

> "Formerly the University was absorbed in itself. It did not seek in the world outside its *raison d'être* and its ends. Now the University is no longer content to teach science. It creates it and pursues its practical applications. It is no longer satisfied with instructing the theoricians and professors, it makes engineers and technicians; it put its speculative genius at the service of all the needs of society."

It is not by chance that the automobile of the air has reached its highest development in France. The encouragement, official and popular, which has been given it from the start is in marked contrast with American indifference and ridicule. The Wright brothers had to go to France for recognition and in the days when they were struggling with difficult problems in aerodynamics and construction none of our universities and technological institutes gave them assistance. Professor Langley, because he happened to be Smithsonian secretary, was able to get a little Government aid, but when his aeroplane on its first flight met with an accident owing to a breaking of the launching ways, that was the end of him. He was laughed down and no Congressman dared suggest paying out money for a machine which did not fly the first time trying.

**Comparative Literature**

Nowadays there is no university and perhaps no college too poor to have its courses in "Comparative Literature." Sometimes these are courses formerly offered by the Department of English Literature, or by the Classical Department, or by that of Modern Languages, and the only novelty about them is the name. For the subject, Comparative

literature, is almost as old as the phenomenon literature itself. There was never any critical appreciation of either verse or prose that was not "comparative": the noun criticism implies comparison, since before we judge we must indeed compare. How does the comparative method work out in individual instances? Let us not take the case of Elizabethan sonnets and dramas, interesting tho that case is, it would perhaps smack overmuch of the classroom. Take rather a novel: George Moore's "Esther Waters," for example. The intelligent reader will want to contrast the author's treatment of a certain type of English girl with George Meredith's treatment of her in "Rhoda Fleming." He will want to compare Mr. Moore's demonstration of the gambling evil with cruder expositions of social curses by earlier English novelists — Fielding, Charles Reade, Dickens—and with Galsworthy's later writings. He will want to compare the pictures of low life with the pictures by French authors not without influence upon George Moore—Zola, for example. Now, whether the study of all these matters takes the form of a doctoral dissertation, an undergraduate's work in a college course, or disinterested consideration by a reader who has no intention of rushing into print or receiving a diploma for his enterprise, it is in any case a piece of work in "comparative literature." The importance of this kind of education, applied to whatever genre or period you will, may easily be exaggerated, as also the value of the results of the investigations made; but the lesson of such studies, the lesson of the oneness of literature, which is akin to the unity of history or science, is a lesson not to be neglected by readers in or out of universities. Properly administered, the department of Comparative Literature offers the student of letters relief from the tyranny of philological training. The peril lurking in it is superficiality—as the peril in philological studies is atrophy of the critical sense and of thought processes.

If men travel for "change" they are booked to suffer frequent disappointments. In our own day the rule of the machine and of the corporation has, as it were, reduced to a common denominator men, manners and manufactures. The same gloves are sold over Tremont street counters, counters in the Avenue de l'Opéra, counters in Bond street. The same films are shown in moving picture theaters of Detroit, Mich.; Portland, Ore.; St. John, New Brunswick. One hears the twang of Sixth avenue and the words of Broadway when a concert singer steps upon a stage in Montreal, Canada, or Austin, Tex. Quebec is an old town—for America—but on our vacation the first words we heard spoken at the boarding house (a French one) were these: "Say, kiddo . . ." If you take a vacation journey in search of change, it is just as well to take the change along with you. Even then you are more than likely to leave it behind.

It would seem that to Mayor Fitzgerald, of Boston, there are in Europe only two countries, Ireland and Germany. According to the report that has come back from his visit to Hamburg with the Boston Chamber of Commerce, in his speech thanking the Burgomaster he said that the party hoped to visit "the two other great German cities, Vienna and Buda Pesth." The Germans present gasped, and so did the Boston visitors, for they had not heard that these cities had been lost to Austria and Hungary. As for Ireland, the other half of Europe, the Mayor makes no errors there, for he owns and runs an Irish Catholic weekly paper, *The Republic*.

We do not often quote compliments so our readers must pardon us when we state that the *New York Press* alludes to "The Morocco Question," by Sydney Brooks, which we published July 27, as "the sanest, soundest, best informed article on Morocco and its present diplomatic embroilment that has ever been contributed to a matter over which the chancellories of the Powers concerned and the European correspondents continually are raising a cloud of dust."

It seems to us that the N. E. A. is coming to be too much like the D. A. R.

# Insurance

## Casualty Insurance Legislation

In a recent address Edwin W. De Leon, president of the Casualty Company of America, made some interesting remarks on excessive insurance legislation. During the last year eighteen legislatures considered 594 bills affecting casualty insurance, and 119 were enacted into law. The United States Congress and five State legislatures appointed commissions to investigate and report on the subject of employers' liability and workman's compensation. Commissions are already at work in five other States. In every case the casualty insurance companies have contributed their share in helping to solve the problems confronting these commissions. Officials of the companies have appeared at the hearings and have frankly and fully exprest their views, based upon actual experience of years in the practical working out of many of the questions involved. Statistics have been freely furnished to corroborate the statements made. In every way the companies have shown not only a keen desire to learn how their mistakes might be corrected, but a ready spirit of co-operation in arriving at the basic principles for liability and compensation laws. Some idea of the magnitude of the operations of casualty companies in this country may be gained from the following figures of their operations during eight years ending January 1, 1910.

| | |
|---|---|
| Number of policies issued | 1,555,014 |
| Premiums received and earned | $124,705,322 |
| Notices of injuries received | 2,326,606 |
| Amount paid for injuries | $62,853,305 |
| Average cost of each injury | $27.01 |
| Number of suits settled | 60,986 |
| Amounts paid for suits settled | $29,263,889 |
| Average cost of each suit settled | $479.84 |
| Reserve for unsettled suits | $4,440,579 |

The attitude of the casualty insurance companies toward legislation is hopeful and helpful. The present situation in many of our States requires the utmost caution in the work of the underwriters, for the casualty insurance companies must create and maintain a fund that will be amply sufficient to meet the demands of the new great burdens unloaded upon them by employers, and they must also be ready to provide adequate compensation to injured employees. The casualty insurance companies do not desire to perpetuate the present unsatisfactory system of compensating workmen for injuries sustained, and will welcome any legislation that provides a fixed definite scale of compensation for occupational injuries, which will enable the companies to adjust the rates of premium upon a basis that has for its ultimate purpose the elevation of the business of liability insurance to the highest plane of utility and permanence.

## The Unexpected Loss

George H. Furbeck, of St. Joseph, Mo., while a passenger on a street railway car, carrying in his hand two incandescent electric light globes, dropped one; in the attempt to catch it he leaned forward, the lamp struck the back of a seat and exploded, cutting his left eye badly, but not causing an entire loss of sight until six days afterward. It then became necessary to remove his eye. Fortunately for the injured man he carried an accident insurance policy in the Travelers Insurance Company of Hartford. The principal of the policy, together with the accumulations and expenses, amounted in all to $20,885.71. The injured man did not expect to lose his eye any more than the five or six million other people did who that day rode in public conveyances. But by having the insurance policy he was protected against the unexpected and received over $20,000 for the loss of one eye. Most people cannot profit by the experiences of others, but must suffer themselves before they can be made to realize the wisdom of foresight. But to the few, who can observe in the experiences of others the value of action, this incident may lead to the desirable end of self-protection against a similar accident.

# Financial

## Currency Reform

Three or four weeks after the end of the present session of Congress, the National Monetary Commission will begin to prepare its report, which will be submitted to Congress at the beginning of the regular session in December. It is expected that the Cummins bill, calling for a report at that time, and closing the life of the Commission immediately after the reception of the report, will be passed. The character of the report is not foreshadowed by members of the Commission, altho the prediction is made by one or two of them that it will recommend adoption of the leading provisions of what is called the Aldrich plan. One member expresses regret that the beginning of a campaign of popular education concerning currency reform has been deferred so long that, in his judgment, it will be difficult to obtain legislation during the regular session.

A league or association to promote popular discussion of the questions which were referred to the Commission was recently formed in Chicago. Prof. J. Laurence Laughlin, of the University of Chicago, is chairman of this association's executive committee. It was intended that there should be branches of the association in many parts of the country. One was formed in New York, last week. John Claflin, the well known merchant, is president; Isidor Straus, interested in old and prominent department stores, is treasurer, and George A. Plimpton is secretary. The members of this branch listened, last week, to an address by Professor Laughlin, who said, in part:

"I desire to make very plain that it is not the intention of the national organization to declare at present for any special plan involving financial legislation at Washington. Of course, I think that there must be changes in our present monetary system. Business troubles of the past and difficulties of a more or less serious kind of the present are what inspired Western business men to form the national organization, whose headquarters have been established in Chicago and of which I am the chairman. It is too soon, however, for us to be for or against the plans of anybody. . . . Remedial legislation is of the same importance to the worker for wages as to the man of business. The sound money campaign of 1896 would never have been won had not the man who worked for wages added his votes to those of the man who already had a little or much money . . . Unfortunately the interest in the effort for banking and currency reform has been limited to bankers and financiers. This has resulted in the country getting the impression that these men were the only ones who desired changes in the laws. The national organization I represent proposes to disseminate reliable and useful information on financial questions to the whole people, so that they can take part in the discussion and the decision of this question. When the weaknesses of the present system are understood and the principles of sound finance made clear to all the people of the country, I have confidence that the legislators will devise the right kind of laws. And I also feel sure that the people will want these laws enacted for the benefit of the whole country and not because they are of any special or peculiar advantage to those who have had small or great success in accumulating or possessing property."

The movement is to be commended and encouraged. We hope that the branch association in New York will have the support of business men thruout the State, and that branches will be established in all the States. Earnest and intelligent discussion of the subject will be of much practical value in promoting wise legislation in Congress.

* * *

....Net earnings of the United States Steel Corporation for the quarter ending with June were $28,108,520, against $23,519,203 for the March quarter and $25,990,978 for the quarter ending with December.

....Owing to unusual demands upon them, on account of very large crops of grain, the Canadian banks will probably ask the Treasury Board for authority to increase their note circulation by 15 per cent., beginning with September.

....It is reported that the Canadian Pacific has decided to have a terminal of its own in Chicago. It reaches that city by means of the Wisconsin Central and the Minneapolis, St. Paul and Sault Ste. Marie roads, which it controls. The Wisconsin Central has been using the Illinois Central's terminal facilities there. It is said that the sum expended will be about $5,000,000.

The Independent

VOL. LXXI NEW YORK, THURSDAY, AUGUST 10, 1911 No. 3271

# Survey of the World

**Arbitration Treaties**

On August 2, two arbitration treaties were signed in the White House at Washington. The signatory powers were the United States and Great Britain, and the United States and France. We comment editorially upon the import of these negotiations. The Anglo-American Convention was signed for Great Britain by Ambassador Bryce and the French treaty was signed for France by Vice-Consul the Viscount de Saint-Phalle. Immediately after signing the treaties President Taft added his signatures to the messages of transmittal, thereby completing arrangements for sending the treaties to the Senate. On August 5 that body made public the text of the treaties at the request of the Administration. Two Senators, Mr. Borah, of Idaho (Rep.), and Mr. Bacon, of Georgia (Dem.), have exprest objections to the conclusion of the treaties in the forms submitted. Their criticism was applied to the third section, identical in the French and British conventions. The text of the treaty with Great Britain follows, the difference between this and the French convention being confined to the preamble (which we omit) and to details such as the dates of existing treaties:

ARTICLE I.

All differences hereafter arising between the high contracting parties which it has not been possible to adjust by diplomacy, relating to international matters in which the high contracting parties are concerned by virtue of a claim of right made by one against the other under treaty or otherwise and which are justiciable in their nature by reason of being susceptible of decision by the application of the principles of law or equity, shall be submitted to the Permanent Court of Arbitration established at The Hague by the convention of October 18, 1907, or to some other arbitral tribunal, as may be defined in each case by special agreement, which special agreement shall provide for the organization of such tribunal if necessary, define the scope of the powers of the arbitrators, the question or questions at issue, and settle the terms of reference and the procedure thereunder.

The provisions of Articles XXXVII to XC, inclusive, of the convention for the pacific settlement of international disputes concluded at the second peace conference at The Hague on October 18, 1907, so far as possible, and unless they are inconsistent with or modified by the provisions of the special agreement to be concluded in each case, and excepting Articles LIII and LIV of such convention, shall govern the arbitration proceedings to be taken under this treaty.

The special agreement in each case shall be made on the part of the United States by the President of the United States, by and with the advice and consent of the Senate thereof, his Majesty's Government reserving the right before concluding a special agreement in any matter affecting the interests of a self-governing dominion of the British Empire to obtain the concurrence therein of the Government of that dominion.

Such agreement shall be binding when confirmed by the two Governments by an exchange of notes

ARTICLE II.

The high contracting parties further agree to institute, as occasion arises, and as hereinafter provided, a Joint High Commission of Inquiry, to which, upon the request of either party, shall be referred for impartial and conscientious investigation any controversy between the parties within the scope of Article I, before such controversy has been submitted to arbitration, and also any other controversy hereafter arising between them, even if they are not agreed that it falls within the scope of Article I; provided, however, that such reference may be postponed until the expiration of one year after the date of the formal request therefor, in order to afford an opportunity for diplomatic discussion and adjustment of the questions in controversy, if either party desires such postponement

Whenever a question or matter of difference is referred to the Joint High Commission of Inquiry, as herein provided, each of the high contracting parties shall designate three of its nationals to act as members of the

Commission of Inquiry for the purpose of such reference, or the commission may be otherwise constituted in any particular case by the terms of reference, the membership of the commission and the terms of reference to be determined in each case by an exchange of notes.

The provisions of Articles IX to XXXVI, inclusive, of the Convention for the Pacific Settlement of International Disputes, concluded at The Hague of the 18th of October, 1907, so far as applicable and unless they are inconsistent with the provisions of this treaty, or are modified by the terms of reference agreed upon in any particular case, shall govern the organization and procedure of the commission

ARTICLE III.

The Joint High Commission of Inquiry, instituted in each case as provided for in Article II, is authorized to examine into and report upon the particular questions or matters referred to it, for the purpose of facilitating the solution of disputes by elucidating the facts, and to define the issues presented by such questions, and also to include in its report such recommendations and conclusions as may be appropriate

The reports of the commission shall not be regarded as decisions of the questions or matters so submitted either of the facts or on the law, and shall in no way have the character of an arbitral award.

It is further agreed, however, that in cases in which the parties disagree as to whether or not a difference is subject to arbitration under Article I of this treaty, that question shall be submitted to the Joint High Commission of Inquiry; and if all or all but one of the members of the commission agree and report that such difference is within the scope of Article I, it shall be referred to arbitration in accordance with the provisions of this treaty.

ARTICLE IV.

The commission shall have power to administer oaths to witnesses and take evidence on oath whenever deemed necessary in any proceding, or inquiry, or matter within its jurisdiction under this treaty, and the high contracting parties agree to adopt such legislation as may be appropriate and necessary to give the commission the powers above mentioned, and to provide for the issue of subpœnas and for compelling the attendance of witnesses in the proceedings before the commission.

On the inquiry both sides must be heard, and each party is entitled to appoint an agent whose duty it shall be to represent his Government before the commission and to present to the commission, either personally or thru counsel retained for that purpose, such evidence and arguments as he may deem necessary and appropriate for the information of the commission

ARTICLE V.

The commission shall meet whenever called upon to make an examination and report under the terms of this treaty, and the commission may fix such times and places for its meetings as may be necessary, subject at all times to special call or direction of the two Governments. Each commissioner, upon the first joint meeting of the commission after his appointment, shall, before proceeding with the work of the commission, make and subscribe a solemn declaration in writing that he will faithfully and impartially perform the duties imposed upon him under this treaty, and such declaration shall be entered on the records of the proceedings of the commission.

The United States and British sections of the commission may each appoint a secretary, and these shall act as joint secretaries of the commission at its joint sessions, and the commission may employ experts and clerical assistants from time to time as it may deem advisable. The salaries and personal expenses of the commission and of the agents and counsel and of the secretaries shall be paid by their respective Governments, and all reasonable and necessary joint expenses of the commission incurred by it shall be paid in equal moieties by the high contracting parties.

ARTICLE VI.

This treaty shall supersede the arbitration treaty concluded between the high contracting parties on April 4, 1908, but all agreements, wards, and proceedings under that treaty shall continue in force and effect, and this treaty shall not affect in any way the provisions of the treaty of January 11, 1909, relating to questions arising between the United States and the Dominion of Canada.

ARTICLE VII.

The present treaty shall be ratified by the President of the United States of America by and with the advice and consent of the Senate thereof, and by his Britannic Majesty. The ratifications shall be exchanged at Washington as soon as possible, and the treaty shall take effect on the date of the exchange of its ratifications. It shall thereafter remain in force continuously unless and until terminated by twenty-four months' written notice given by either high contracting party to the other.

**Diplomatic Promotions**

John G. A. Leishman, Ambassador to Italy, is President Taft's choice for American Ambassador to Germany, to succeed Dr. David Jayne Hill, who resigned last spring. His appointment will be accepted by the German Emperor. Mr. Leishman entered the foreign service in 1897 as Minister to Switzerland. He was transferred to Turkey in 1900, and in 1906 the post was raised to an Ambassadorship. In the same year Mr. Leishman was transferred to Rome. His successor at Rome is likely to be Thomas J. O'Brien, the present Ambassador to Japan, who will himself be succeeded by Charles Page Bryan, Minister to Belgium. Mr. Bryan has been Min-

ister to Belgium since December, 1909, having previously served as Minister to Portugal, China, Brazil and Switzerland.

**Aviation**

Lincoln Beachey, a twenty four-year-old aviator, won the $5,000 race from Governor's Island, New York, to Philadelphia, August 5. The course was about 90 miles and the flying time 1 hour, 50 minutes, 17 seconds.——Harry N. Atwood, of Boston, who won the trophy offered some time ago by a New York newspaper for a flight from Boston to Washington, announces that he will start on Saturday from Milwaukee for New York City, hoping to win $10,000 offered by Victor J. Evans, of Washington. The distance is 1,062 miles, or a little more than the British cross-country course. On Saturday, Captain Felix, of the French military aviation school, ascended 11,330 feet, breaking the world's record. The ascent was made in 63 minutes and the descent in 12½ minutes. The previous record was made by M. Legagneux at Pau (10,499 feet), the late Arch Hoxey's record of 11,474 feet at Los Angeles never having been verified.

**Trust Questions**

The Government has brought suit, in the Federal court at Columbus, Ohio, against the Lake Shore, Chesapeake & Ohio, Toledo & Ohio Central, Hocking Valley, Kanawha & Michigan and Zanesville & Western railroad companies, and the Sunday Creek, Continental and Kanawha & Hocking coal companies, for violation of the Anti-Trust law in connection with the mining, transportation and sale of bituminous coal.——All but ten of the eighty-three men indicted for their connection with a combination in the wire trade have appeared in court and been fined, the total thus far being $136,700. Herbert L. Satterlee, son-in-law of J. Pierpont Morgan, was required to pay $1,000. Edwin E. Jackson, who organized the combination, paid $45,000, or $5,000 for each one of nine indictments.——Ex-President Roosevelt testified last week before the House Committee that is making an investigation concerning the origin and history of the United States Steel Corporation, speaking of his relation to the Corporation's purchase of the Tennessee Coal & Iron Company soon after the beginning of the panic of 1907. It had not been his duty, he said, to prevent that purchase by expressing disapproval. He had acted upon his own initiative, and the responsibility was his alone. His action had been right and proper; if he had taken the opposite course his action would have been "well-nigh criminal" in its relation to the interests of the people. The purchase checked the panic; the results of it, regarded from every standpoint, had been beneficial; it had added only 4 per cent. to the Corporation's share of the steel industry, increasing that share from 58 to 62 per cent., and this addition had made no change in the Corporation's legal status.

**Strikes Here and Abroad**

The carmen of the Coney Island and Brooklyn Railroad Company, New York, went on strike last Saturday, the strikers being members of the Amalgamated Association of Street Railway Employees. Rioting occurred and numerous arrests have been made. On Sunday fifteen persons, including a number of passengers, were injured by strikers who stoned the cars. The carmen demand an increase of pay from 23 to 25 cents an hour for regular men, and from $1.75 to $2 a day for substitutes.——A strike on the street railway system of Des Moines, Iowa, has been interrupted by a court order reinstating the union carman whose discharge had brought on the strike.——The officers of the International Seamen's Union of America, sitting at New York City, has declared a strike of seamen on the tramp trans-Atlantic steamers. The idea is to prevent American sailors from taking the place of British union seamen in the strike.——The strike of dockers in South Wales has spread to a considerable extent. At Cardiff, the strikers have been joined by the patent fuel workers, the dry-dock workers and the laborers at the Rio Tinto Copper Works. The Metropolitan Police has sent reinforcements to Cardiff, but rioting has on several occasions broken out. In one battle 150 police were engaged for nearly three hours, and some 18 constables

were injured. Detachments of light infantry, Gordon Highlanders and Hussars are concentrated at nearby points in readiness for any emergency. A general strike, including 12,000 dockers at London, has been averted, however, and arbitration is hoped for. The dockers claim an advance in wages. American meats remain aboard a number of vessels which are unable to discharge cargo, and some of the ships will proceed from London to Continental ports. At London there is already a shortage in beef and mutton, and prices have been advanced by English retailers.——In Amsterdam there are indications that the dockers' strike is nearing an end. The number of men now out is probably between three and four thousand. The workingmen's Socialist organizations have withheld pecuniary support, and it is said that the strikers have maintained themselves largely thru terrorism. Amsterdam is losing ground as a port thru the continuance of the strike.

**Adventures of a Cuban Rebel**

General Acevedo, a veteran revolutionist, attacked the Cuban Government, on the 1st, by proclaiming rebellion at Regia, across the bay from Havana. He had an army of eight men, who distributed copies of a manifesto in which he asserted the Gomez Administration was corrupt, urged the people to rise against it, gave President Gomez fifteen days in which to resign, and promised to lay the entire country in ashes if he should refuse to retire from office. Troops were sent after the bold general. Two days later, his army having been reduced to one man, he sent word to the Governor of the Province that he wanted to surrender, being then about 20 miles from Havana, and he was permitted to do so.——President Diaz, of Nicaragua, and General Mena, his Minister of War, have reached a friendly agreement as to their differences, and thus much trouble is said to have been averted. Diaz's disagreement with Mena was inherited from his predecessor, President Estrada. Great floods in the valley of the Escondido River, not far from Bluefields, have caused much loss of life and property. The banana output will be largely reduced for a year to come. Work upon the fortifications of the Panama Canal was begun last week, and it is expected that they will be completed before the opening of the canal. Orders for the large guns have been placed. More slides in the Culebra Cut are reported, requiring an additional excavation of 5,000,000 cubic yards. It is said that President Taft and a party of Senators will go to the Isthmus in November.

**Reyes a Candidate in Mexico**

Gen. Bernardo Reyes said to the people of Mexico, last week, that he was a candidate for the Presidency. He also said that he would withdraw and leave the country if he should be convinced that his candidacy would cause a new war. It is reported that Ernesto Madero, uncle of the revolutionist leader and now Minister of Finance, will have the second place on the Reyes ticket. On the 4th, a party of prominent revolutionists had an interview with Francisco Madero, seeking from him a promise that, if elected, he would never ask Reyes to enter his Cabinet. He refused to make such a promise.——The dismissal of Emilio Gomez, Minister of the Interior, from the Cabinet, on the 2d, caused excitement and anxiety. Gomez, whose brother Francisco is Minister of Education, said he had been at variance with President De la Barra, who was a conservative while he himself was a radical, devoted to the revolution's ideals. The friends of the dismissed Minister were angry. In an interview with the President they threatened to make another revolution. There was danger of a riotous demonstration, and troops were held ready at the capital. But Francisco Madero in a public statement said that he fully approved the dismissal of Gomez, who had "placed difficulties in the way of the De la Barra Government." Gomez himself, addressing his friends, counseled moderation. De la Barra, thru the press, declared a determination to use his power for a realization of the revolution's ideals. It was his purpose also to guarantee the security of life and property, and he had the support of 27,000 soldiers. ——At El Oro, Mexico's largest mining camp, where American, English and

French capital is invested, 12,000 miners went on strike last week and warned all foreigners to leave the place. There were riots, and fourteen strikers were killed by troops. The garrison was promptly reinforced. Dynamite bombs were found, and, because the men had offered a reward for the assassination of the manager of the mines, the company has asked for an official investigation.——In a fight some miles south of Juarez, seven Liberals, or Magonists, were killed last week by the Rural Guard. Owing to an order for the dismissal of about fifty revolutionist employees in the customs service at Juarez, the custom house there was seized and held by them. Five hundred soldiers were sent from Chihuahua to drive them out.

**Revolutionists Win in Hayti**

Hayti's revolutionists have taken possession of the capital, from which President Simon fled, on the 2d, to an American schooner in the harbor. Two days later he sailed for Kingston (Jamaica), going into exile there as his predecessor, Nord Alexis, did in 1908, fleeing before this same Simon, then a victorious revolutionist. Alexis died there in 1910. On the 1st, as the entire country, the capital excepted, was in the hands of the revolutionists, Simon was urged by the foreign Ministers to resign. He consented to do this, but asked for a truce of three days. Whereupon the Ministers had interviews with the revolutionists' commanders, whose troops surrounded the city. There are two factions. One was willing that there should be three days' delay; the other was not. While Simon and the members of his family were embarking, on the 2d, they were attacked by a mob. His daughter was wounded, and her escort, Simon's Chamberlain, was shot dead at her side. In all, five persons were killed. Simon was protected on the schooner by a guard from an American battleship. He was carried to Kingston on a Dutch steamer. A committee of safety was formed. After the revolutionists entered the city, marines were landed from the German and the French battleships. During the first day and night forty persons were killed while looting houses and stores. One wing of the revolutionist army represents the aspirations of General Cincinnatus Leconte, formerly Minister of the Interior; the other supports General Antenor Firmin, Minister to Great Britain. Twenty soldiers were killed in a fight between the two factions. On the 4th Leconte proclaimed his dictatorship. On the same day Firmin sailed from St. Thomas, and with him sixty Haytian exiles from that port or from Porto Rico. It is expected that there will be war between Leconte's soldiers and those who are loyal to Firmin. There are five American warships in Haytian waters.

**South America**

A new revolutionary plot, involving many officers of the army, was discovered in Paraguay last week. The leaders of the movement were arrested. ——There were reports in Peru, on the 3d, that Chili was about to occupy the Territory of Ticaco, which is a part of the tract as to which the two countries are in controversy. It was said at Lima that such occupation would cause war. On the 5th, Chili declared that the report had no foundation in fact.——A battle was fought on the 5th between the troops of Colombia and those of Peru at Coqueta, which is in unorganized territory held by Colombia but claimed by Peru. The Colombians were defeated. ——Argentina is offended by the decree of the Italian Government prohibiting emigration from Italy to that country. Altho sanitary reasons for the order are given, an impression prevails in Argentina that it is a manifestation of hostility, due to several incidents, one of these being Argentina's rejection of Italy's offer to build her new battleships.

**The Lords**

The Unionist peers who have gained the name of "No Surrenderites" have met and adopted a resolution to

support Lord Halsbury in his determination never to yield to the Premier's threat to overthrow by a gross abuse of the royal prerogative the right and the liberties of the inhabitants of the United Kingdom, vested in the ancient government of the realm by the King, Lords and Commons."

This is bravado, however, for Lord Morley has published a list of seventy-six Liberal peers who have promised the Government their votes on the veto bill.

Ballots enough will undoubtedly be added by Unionists who follow Lord Lansdowne to carry the measure. The Government will thus probably avoid taking the unpopular step of creating new peers. Parliament will probably be adjourned August 18, to reassemble late in October.

**The Moroccan Crisis**

The danger of war as a result of German demands upon France seems now to have been materially diminished. France, it is said, will cede to Germany territory in the French Kongo, in return for a free hand in Morocco, and it is stated that Russia had acted as a friendly intermediary. It is, however, declared that France still wishes to submit the Moroccan question to another European conference, and this is opposed by the German Government.——Surprise has been exprest in the Belgian press that the German demands respecting Morocco should have included the cession of the French contingent rights over the Kongo State. The *Indépendance Belge* has published a letter by the Belgian jurisconsult, M. Nys, declaring that the right of pre-emption vested in France cannot be ceded or transferred to a third Power. In the negotiations now in progress both Germany and France have been compelled, it is said, to concede a number of important points, neither Power being prepared to press matters too far, Germany in especial reducing the demands of her Foreign Minister, Herr Waechter. An outbreak of protest from extreme partisans on both sides of the frontier is anticipated. Already the pan-German press has attacked the Kaiser's Foreign Minister and the Imperial Chancellor, demanding their retirement, asking the question: "What has happened to the Hohenzollerns?"——The *Marine Rundschau* of Berlin publishes a dispatch from Tokyo stating that Japan will seek to compensate herself for the disadvantages she suffers under the revised treaty with England by a rapprochement with Germany. Viscount Aoka and two Cabinet Ministers, MM. Goto and Hirato, are taking the initiative in reorganizing the defunct "Society for the Cultivation of German-Japanese Friendly, Scientific and Social Relations." While Admiral Togo is visiting the United States, General Nogi, the victor of Port Arthur, is the Kaiser's guest at Berlin.

**French Affairs**

The Monis Ministry fell when a militarist deputy interpellated the War Minister as to the command in time of war. The new Ministry has now made proposals for the readjustment of the functions of the commander-in-chief, and the Minister of War, M. Messimy, has submitted his scheme to the President prior to laying it before the Chambers. The proposal is said to invest the officer appointed commander-in-chief of the northeastern group of armies with titular control of the General Staff of the army, while the chief of the General Staff will retain the practical direction of this department. It is believed that General Joffre will be offered the supreme command. The fact is not concealed that there are dissensions in the Army Council.——It is planned to establish communication by wireless telegraph between Paris and all the French possessions in Africa. French cables are actually laid only to Tunis, Algeria and Dakar. Several months elapse before France can exchange news with equatorial Africa.——New methods of railway sabotage are constantly revealed. Near Firminy an electric circuit was linked up with the telegraph wires, with the result that they were fused, and on the Paris-Nogent line the rails were taken up for a distance of about 80 yards. The police offer a reward of $1,000 for information leading to the detection of the manifestants who recently tried to derail the Paris-Havre express. Some of the authors of wanton acts of destruction and disorder have already been captured, and the western lines are patrolled by the police.——Fires have been raging in the forest of Fontainebleau, and it has been only by the strenuous efforts of troops and foresters that the flames were prevented from reaching a powder magazine situated near the Rocher de Boutigny. In the course of the last month fires have broken out in various parts of the forest at points well removed from the railway.——The Government is said to contemplate abolishing the Department of Public Worship. The next

year's budget will probably provide for the change. The business of the department will in that case be administered by the Interior Department and Colonial Office.

**The Near East**

In the "Survey" last week we commented upon the administration of the Persian treasury by W. Morgan Shuster, the American financial expert. The correspondent of the London *Times* congratulates President Taft upon having

"done Persia a signal service in introducing to her one who had already worked wonders in the Philippines. . . . Mr. Shuster appears to have completely won the confidence of that somewhat fickle assembly, the Mejliss. . . . All the best elements in the country and all those who have no handling of public funds are naturally enthusiastic. Battle is in fact formally opened between the forces of honesty and dishonesty. Against him are the ignoble army of peculators from high ministers to petty officials. . . . The battle will certainly be interesting and it seems evident that Mr. Shuster can rely on the sympathy of Great Britain."

The Sipahdar, who lately asked for an unauthorized credit of nearly $500,000 "for extraordinary expenses in the army," and was refused by the American Treasurer-General, tendered his resignation to the Regent upon the passage of a resolution of the legislature calling for his retirement. Arrests of suspected persons are being made and the revolution is being treated in a firmer manner. Russia and England have exchanged views regarding the return to Persia of the ex-Shah, Mohammed Ali, and are in perfect harmony. Both Governments, said the *Times*, would prefer the regency of Nasr-Ul-Mulk to the restoration of the former Shah, yet agree that the latter's return is the domestic concern of Persia. Mohammed Ali has forfeited his pension in staking all upon one desperate throw. It seems likely that he has been misled, and that the actual Government will maintain itself without too great difficulty. Late reports from Teheran say that Mohammed Ali has landed at Ashraf, in the Province of Mazanderan, 50 miles west of Astrabad. He is awaiting developments at Teheran before making a further move.——In spite of the excellent impression made by Mr. Shuster at Treasurer-General, the French and Italian representatives at Teheran have joined those of Germany and Russia in protesting against payments being made by him. Russia is also disturbed by rumors that Major C. B. Stokes, British military attaché at Teheran, has been appointed as head of an expedition against the deposed Shah Mohammed Ali Mirza. Russia and Great Britain, says the *Novoe Vremya*, should not interfere in the internal affairs of Persia. If Great Britain prizes the Anglo-Russian agreement of 1907 she will not permit Mr. Stokes to resign his commission in the British army for the sake of participating in combats outside the British sphere of influence, or consent to his appointment as chief of the financial gendarmerie under the "financial dictator Shuster," to operate thruout Persia, including the northern provinces within the Russian sphere of influence. A Cossack brigade has refused to return to the Persian Minister of War mountain battery ammunition intended for a campaign against the ex-Shah, tho the ammunition was delivered to the brigade thru an error. The Russian consuls at Ardebil and Ispahan have forcibly prevented mass meetings of protest against the ex-Shah's return. The Russian Bank at Teheran has advanced a large sum to the reactionary committee, which sits at the Russian Legation.——The Malissori tribesmen of Albania have accepted the concessions made to them by the Turkish Government on condition that they cease hostilities and disperse. The Montenegrin Minister of War told the tribesmen that King Nicholas wished them to give up the revolt, in order that they might profit by considerable concessions. The Turkish proposals include a general amnesty, and no taxes are to be levied for two years. The carrying of arms is permitted, except in towns and bazaars. About $60,000 is promised as compensation for damaged and demolished houses, and there is to be relief for those refugees who have lost this year's crops. Albanian officials and teachers are promised. Successive amnesties have been declared since June 24. Autonomy has been the Albanian demand. Apparently this will now be approximated, at least, without European intervention.

# The Jewish Race

BY ISRAEL ZANGWILL

(Author of "Children of the Ghetto," "The Melting Pot," Etc.)

TO sum up in a few thousand words a race which has energized for 4,000 years is a task which can only be executed, if at all, by confining oneself to elementals. And of these elementals the first and most important is the soul of the people. The soul of the Jewish race is best seen in the Bible, saturated from the first page of the Old Testament to the last page of the New with the aspiration for a righteous social order and an ultimate unification of mankind of which, in all specifically Jewish literature, the Jewish race is to be the medium and missionary. Wild and rude as were the beginnings of this race, frequent as were its backslidings, and great as were—and are—its faults, this aspiration is continuous in its literature even up to the present day. There is every reason to believe that the historic texts of the Old Testament were redacted in the interests of this philosophy of history, but this pious falsification is very different from the self-glorification of all other epics. Israel appears thruout not as a hero but as a sinner who cannot rise to his rôle of redeemer, of "servant of the Lord"—that rôle of service, not dominance, for which his people was "chosen." The Talmud, the innumerable volumes of saintly Hebrew thought, the Jewish liturgy, whether in its ancient or its mediaeval strata, the "modernist" platforms of reformed American Synagogues, all echo and re-echo this conception of "the Jewish mission." Among the masses it naturally transformed itself into nationalism, but even this narrower concept of "the chosen people" found poetic expression as a tender intimacy between God and Israel.

"With everlasting love hast Thou loved the house of Israel, Thy people; a Law and commandments, statutes and judgments, hast Thou taught us. . . . Blessed art Thou, O Lord, who lovest Thy people, Israel."

Such is the evening benediction still uttered by millions of Hebrew lips.

And the performance of this Law and these commandments, statutes and judgments, covering as they did the whole of life, produced—despite the tendency of all law to over-formality—a domestic ritual of singular beauty and poetry, a strenuous dietary and religious régime, and tender and self-controlling traits of character, which have combined to make the Jewish masses as far above their non-Jewish environment as the Jewish wealthier classes are below theirs. No demos in the world is so saturated with idealism and domestic virtue, and when it is compared with the yet uncivilized and brutalized masses of Europe, when, for example, the lowness of its infantile mortality or the healthiness of its school children is contrasted with the appalling statistics of its neighbors, there is sound scientific warrant for endorsing even in its narrowest form its claim to be "a chosen people."

This extraordinary race arose as a pastoral clan in Mesopotamia, roved to Palestine, thence to Egypt, and after a period of slavery returned to Palestine as conquerors and agriculturists, there to practise the theocratic code imposed by Moses (perhaps the noblest figure in all history), and to evolve in the course of the ages a poetic and prophetic literature of unparalleled sublimity. That union of spirituality, intellectuality and fighting-power in the breed, which raised it above all ancient races except the Greek, was paid for by an excessive individualism which distracted and divided the State. Jerusalem fell before the legions of Titus. But—half a century before it fell—it had produced Christianity and thus entered on a new career of world-conquest. And five centuries after the destruction of Jerusalem, its wandering scions had impregnated Mohammed with the ideas of Islam. Half the world was thus won for Hebraism in some form or other and the notion of "the Jewish mission" triumphantly vindicated. A nucleus of the race, however, still persisted, partly by nationalist instinct, partly by the faith that its doctrines had been adulterated by illegitimate elements and its mission was still unaccomplished, and it is this

persistence to-day of a Hebrew population of twelve millions—a Jewdom larger than any that its ancient conquerors had ever boasted of crushing—which constitutes the much-discussed Jewish problem.

But there was a Jewish diaspora even before Jerusalem fell; settlements of Jews all round the Mediterranean, looking, however, to Jerusalem as a national and religious center. The Book of Esther is historically dubious, but it contains one passage which is a summary of Jewish history: "And Haman said unto King Ahasuerus, There is a certain people scattered abroad and dispersed among the people in all provinces of thy Kingdom, and their laws are diverse from all people; neither keep they the King's laws: therefore it is not for the King's profit to suffer them. If it please the King, let it be written that they may be destroyed." The Jewish problem in fact, from the Gentile point of view, is entirely artificial. It springs exclusively from Christian or heathen injustice and intolerance, from the oppression of minorities, from the universal law of dislike for the unlike. In Russia, which harbors nearly half of his race, the Jew is confined to a Pale and forbidden the villages even of that Pale, he is cramped and crippled at every phase of his existence, he must fight for Russia but cannot advance in the Army or the Navy or the Government service, except at the price of baptism. Occasionally bands of Black Hundreds are loosed upon him in bloody pogroms, but his everyday existence has not even this tragic dignity. It is a sordid story of economic oppression designed to keep this mere four per cent. of the population from dominating Holy Russia. Ten years ago Count Pahlen's Commission reported that "ninety per cent. of the Jews in the Pale have no stable occupation" and if the Government enforces the Sunday Law recently passed by the Duma it means that they will in many cases be forced to choose between their own Sabbath and economic starvation. Already the ancient hope and virtue of the most cheerful of races are slowly asphyxiating in the never-lifting fog of poverty and persecution. A similar situation in Roumania, if on a smaller scale as affecting only a quarter of a million of Jews, is accentuated in bitterness by Roumania's refusal to fulfil the obligation of equal treatment she undertook at the Berlin Congress, and the passivity of the Powers in presence of violated treaties adds to the Jewish tragedy the tragedy of a world grown callous of its own spiritual interests. The Jews, whose connection with Roumania is at least fifteen centuries old, are not even classed as citizens. They are "Vagabonds." In Morocco the situation of the Jews is one of unspeakable humiliation. They are confined to a Mellah, and as the Moroccan proverb puts it "One may kill as many as seven Jews without being punished." The Jews have even to pickle the heads of decapitated rebels. Tested by the Judaeometer, Germany herself is still uncivilized, for if she has had no Dreyfus case, it is because no Jew is permitted military rank. Even in America with its lip-formula of brotherhood, a gateless Ghetto has been created by the isolation of the Jews from the general social life.

But if from the Gentile point of view the Jewish problem is an artificial creation, there is a very real Jewish problem from the Jewish point of view—a problem which grows in exact proportion to the diminution of the artificial problem. Orthodox Judaism in the diaspora cannot exist except in a Ghetto, whether imposed from without or evolved from within. Rigidly professing Jews cannot enter the general social life and the professions. Jews *qua* Jews were better off in the Dark Ages, living as chattels of the king under his personal protection and to his private profit, or in the ages when they were confined in Ghettos. Even in the Russian Pale a certain measure of autonomy still exists. It is emancipation that brings the "Jewish Problem." It is precisely in Italy with its Jewish Prime Minister and its Jewish Syndic of Rome that this problem is most acute. The Saturday Sabbath imposes economic limitation even when the State has abolished them. As Shylock pointed out, the race cannot eat or drink with the Gentile. Indeed social intercourse would lead to intermarriage. Unless Judaism is reformed it is, in the language of Heine, a misfortune, and if it is reformed, it cannot logically confine its teachings to the Hebrew race, which, lacking the normal protection of a terri-

tory, must be swallowed up by its proselytes.

The comedy and tragedy of Jewish existence to-day derive primarily from this absence of a territory in which the race could live its own life. For the religion which has preserved it through the long dark centuries of dispersion has also preserved its territorial traditions in an almost indissoluble amalgam of religion and history. Palestine soil clings all about the roots of the religion, which has, however, only been transplanted at the cost of fossilization. The old agricultural festivals are observed at seasons with which, in many lands of the Exile, they have no natural connection. The last national victory celebrated—that of Judas Maccabaeus—is two thousand years old, the last popular fast dates from the first century of the Christian era. The Jew agonizing in the Russian Pale rejoices automatically in his Passover of Freedom, in his Exodus from Egypt. Even while the tribal traits had still the potential fluidity of life, neither Greeks nor Romans could change this tenacious race. Its dispersion from Palestine merely indurated its traditions by freeing them from the possibility of common development. The religious customs defended by Josephus against Apion are still the rule of the majority. Even new traits superimposed by their history upon fractions of the race are conserved with equal tenacity. The Jews expelled from Spain in 1492 still retain a sub-loyalty to the King of Spain and speak a Spanish idiom, printed in Hebrew characters, which preserves in the Orient words vanished from the lips of actual Spaniards and to be found only in Cervantes.

This impotency to create afresh—which is the negative aspect of conservatism—translated itself, after the final revolt of Bar-Cochba against the Romans early in the second century, into a pious resignation. The Jewish Exile was declared to be the will of God, which it was even blasphemous to struggle against, and the Jews, in a strange and unique congruity with the teachings of the prophet they rejected, turned the other cheek to the smiter and left to Cæsar the things that were Cæsar's, concentrating themselves in every land of the Exile upon industry, domesticity and a transmuted religion, in which realities were desiccated into metaphors, and the Temple sacrifices sublimated into prayers. Rabbinic opportunism, while on the one hand keeping alive the hope that these realities, however gross, would come back in God's good time, went so far in the other direction as to lay it down that the law of the land was the law of the Jews. Everything in short—in this transitional period between the ancient glory and the Messianic era to come—was sacrificed to the ideal of mere survival. The mediæval teacher Maimonides laid it down that to preserve life even Judaism might be abandoned in all but its holiest minimum. Thus—under the standing menace of massacre and spoliation—arose Crypto-Jews or Marranos, who, frequently at the risk of the stake or sword, carried on their Judaism in secret. Catholics in Spain and Portugal, Protestants in England, they were in Egypt or Turkey Mohammedans. Indeed the *Dönmeh* still flourish in Salonika and provide the Young Turks with statesmen, the Balearic Islands still shelter the *Chuetas*, and only half a century ago persecution produced the *Yedil-al-Islam* in Central Asia. Russia must be full of Greek Christians who have remained Jewish at heart. Last year a number of Russian Jews, shut out from a university career, and seeking the lesser apostacy, became Mohammedans, only to find that for them the Trinity was the sole avenue to educational and social salvation.

Where existence could be achieved legally, yet not without social inferiority, a minor form of Crypto-Judaism was begotten, which prevails to-day in most lands of Jewish emancipation, among its symptoms being change of names, accentuated local patriotism, accentuated abstention from Jewish affairs, and even anti-Semitism mimetically absorbed from the environment. Indeed Marranoism, both in its major and minor forms, may be regarded as an exemplification of the Darwinian theory of protective coloring. The pervasive assimilating force acts even upon the most faithful, undermining more subtly than persecution the life-conceptions so tenaciously perpetuated.

Nor is there anywhere in the Jewish world of to-day any centripetal force to

counteract these universal tendencies to dissipation. The religion is shattered into as many fragments as the race. After the fall of Jerusalem the Academy of Jabneh carried on the authoritative tradition of the *Sanhedrin*. In the Middle Ages there was the *Asefah* or Synod to unify Jews under Judaism. From the middle of the sixteenth to the middle of the eighteenth century, the *Waad* or Council of Four Lands legislated almost autonomously in those Central European regions where the mass of the Jews of the world was then congregated. Today there is no center of authority, whether religious or political. Reform itself is infinitely individual, and nothing remains outside a few centers of congestion but a chaos of dissolving views and dissolving communities, saved from utter disappearance by persecution and racial sympathy. The notion that Jewish interests are Jesuitically federated or that Jewish financiers use their power for Jewish ends is one of the most ironic of myths. No Jewish people or nation now exists, no Jews even as sectarians of a specific faith with a specific center of authority such as Catholics or Wesleyans possess; nothing but a multitude of individuals, a mob hopelessly amorphous, divided alike in religion and political destiny. There is no common platform from which the Jews can be addressed, no common council to which any appeal can be made. Their only unity is negative—that unity imposed by the hostile hereditary vision of the ubiquitous Haman. They live in what scientists call symbiosis with every other people, each group surrendered to its own local fortunes. This habit of dispersed and dependent existence has become second nature, and the Jews are the first to doubt whether they could now form a polity of their own. Like Aunt Judy in "John Bull's Other Island" who declined to breakfast out of doors because the open air was "not natural," the bulk of the Jews consider a Jewish State as a political perversion. There are no subjects more zealous for their adopted fatherlands: indeed they are only too patriotic. There are no Ottoman so Young Turkish as the Turkish Jews, no Americans so spread-eagle as the American Jews, no section of Britain so Jingo as Anglo-Jewry, which even converts the Chanukah celebration of Maccabæan valor into a British military festival. Of the two British spies now confined in German fortresses one is a Jew. The French Jewry and the German reproduce in miniature the Franco-German rivalries, and the later even apes the aggressive *Welt-Politik*. All this ultra-patriotism is probably due to Jews feeling consciously what the other citizens take subconsciously as a matter of course; doubtless too a certain measure of Marranoism or protective mimicry enters into the ostentation. At any rate each section of Jewry, wherever it is permitted entrance into the general life, invariably evolves a somewhat overcolored version of the life in which it finds itself embedded, and fortunate must be accounted the peoples which have at hand so gifted and serviceable a race, proud to wear their livery.

What wonder that Jews are the chief ornaments of the stage, that this chameleon quality finds its profit in artistic mimicry as well as in biological. Rachel, the child of a foreign pedlar in a Paris slum, teaches purity of diction to the Faubourg St. Germain; Sarah Bernhardt, the daughter of Dutch Jews, carries the triumph of French acting across the Atlantic. A Hungarian Jew, Ludwig Barnay, played a leading rôle in the theatrical history of Germany, and another, von Sonnenthal, in that of Austria. For if, like all other peoples, the Jews can only show a few individuals of creative genius—a Heine, a Spinoza, a Josef Israels, a Mendelssohn, etc.—they flourish in all the interpretative arts out of all proportion to their numbers. They flood the concert-platforms—whether as conductors, singers or performers. As composers they are more melodious than epoch-making. Till recently unpractised in painting and sculpture they are now copiously represented in every gallery and movement, though only rarely as initiators. Indeed the Jew is a born intermediary and every form of artistic and commercial agency falls naturally into his hands. He is the connoisseur *par excellence*, the universal art-dealer. His gift of tongues, his relationship with all the lands of the Exile, mark him out for success in commerce and finance, in journalism and criticism, in scholarship and travel. It was by their linguistic

talents that the adventurous journeys of Arminius Vambery and Emin Pasha were made possible. If a Russian Jew, Brennon, is the chief authority on Italian art, and George Brandes, the Dane, is Europe's greatest critic, if Reuter initiated telegraphic news and Blowitz was the prince of foreign correspondents, if the Jewish Bank of Amsterdam founded modern finance and Charles Frohman is the world's greatest entrepreneur, all these phenomena find their explanation in the cosmopolitanism of the wandering Jew. Lifted to the plane of idealism, this cosmopolitan habit of mind creates Socialism thru Karl Marx and Lassalle, an international language thru Dr. Zamenhof, the inventor of Esperanto, a prophecy of the end of war thru Jean de Bloch, an International Institute of Agriculture thru David Lubin, and a Race Congress thru Dr. Felix Adler. For when the Jew grows out of his own Ghetto without narrowing into his neighbor's, he must necessarily possess a superior sense of perspective.

As a physician the Jew's fame dates from the Middle Ages, when he was the bearer of Arabian science, and the tradition that kings shall always have Jewish physicians is still unbroken. Dr. Ehrlich's recent discovery of "606," the cure for syphilis, and Dr. Haffkine's inoculation against the Plague in India, are but links in a long chain of Jewish contributions to medicine. Nor would it be possible to mention any other science, whether natural or philological, to which Jewish professors have not contributed revolutionizing ideas. The names of Lombroso for criminology, Benfey for Sanscrit, Jules Oppert for Assyriology, Sylvester for Mathematics, and Mendeleiff for Chemistry ("The Periodic Law") must suffice as examples.

In law, mathematics and philosophy, the Jew is peculiarly at home, especially as an expounder. In chess he literally sweeps the board. There is never a contest for the championship of the world in which both rivals are not Jews. Even the first man to fly (and die) was the Jew, Lilienthal.

But to gauge the contribution of the Jew to the world's activity is impossible here. To mention only living Jews, one thinks at random of Rothschilds with their ubiquitous financial and philanthropic activity, Sir Ernest Cassel financing the irrigation of Egypt, Mr. Jacob Schiff financing the Japanese war against Russia and building up the American Jewry, Herr Ballin creating the Hamburg American Line, Maximilian Harden's bold political journalism, the Dutch jurist Asser at The Hague conference, or the American statesman and peace-lover Oscar Straus, the French plays of Bernstein, or the German plays of Ludwig Fulda, or the Dutch plays of Heyermanns, or the Austrian plays of Schnitzler, the trenchant writings of Max Nordau, the paintings of Solomon and Rothenstein, of Jules Adler and Max Liebermann, the archeologic excavations of Waldstein, Hammerstein building the English Opera House, Imre Kiralfy organizing our Exhibitions, Sidney Lee editing the Dictionary of English Biography, Sir Matthew Nathan managing the Post Office, Meldola investigating coal-tar dyes, the operas of Goldmark, the music-plays of Herr Oscar Straus and Humperdinck (Herr Max Bernstein,) the learned synopses of Salomon Reinach, the sculpture of Antokolsky, Mischa Elman and his violin, Sir Rufus Isaacs pleading on behalf of the Crown, Signor Nathan polemizing with the Pope, Dr. Frederick Cowen conducting one of his own symphonies, Michelson measuring the velocity of light, Lippmann developing color photography, Henri Bergson giving pause to Materialism with his new philosophy of Creative Evolution, Bréal expounding the science of Semantics, or Hermann Cohen his neo-Kantism, and one wonders what the tale would be both for yesterday and to-day if every Jew wore a yellow badge and every crypto-Jew came out into the open, and every half-Jew were as discoverable as Montaigne or the composer of "The Mikado." The Church could not even write its own history; that was left for the Jew, Neander. To the Gentile the true Jewish problem should rather be how to keep the Jew in his midst—this rare one per cent. of mankind. The elimination of all this genius and geniality would surely not enhance the gaiety of nations. Without Disraeli would not England lose her only Saint's Day?

But the miracle remains that the Gen-

tile world has never yet seen a Jew, for behind all these cosmopolitan types which obsess its vision, stand inexhaustible reserves of Jewish Jews—and the Talmudic mystic, the Hebrew-speaking sage, remains as unknown to the Western world as though he were hidden in the fastnesses of Tibet. A series of great scholars—Geiger, Zunz, Steinschneider, Schechter—has studied the immense Hebrew literature produced from age to age in these obscure Jewries. But there is a modern Hebrew literature, too, a new galaxy of poets and novelists, philosophers and humanists, who express in the ancient tongue the subtlest shades of the thought of to-day. And there is a still more copious literature in Yiddish, no less rich in men of talent and even genius, whose names have rarely reached the outside world.

And if the Jew, with that strange polarity which his historian Graetz remarked in him, displays simultaneously with the most tenacious preservation of his past the swiftest surrender of it that the planet has ever witnessed, if we find him entering with such passionate patriotism into almost every life on earth but his own, may not even the Jewish patriot draw the compensating conclusion that the Jew therein demonstrates the comparative superficiality of all these human differences? Like the Colonel's lady and Judy O'Grady all these peoples are the same under their skins—as even Bismarck was once constrained to remark when he saw Prussians and Frenchmen lying side by side in the community of death. Could Jews so readily assimilate to all these types, were these types fundamentally different? The primitive notion of the abysmal separateness of races can scarcely survive under Darwinism. Every race is really akin to every other. Imagine a Canine Congress debating if all these glaring differences of form, size and color could possibly consist with an underlying and essential dogginess. It is curious that Houston Chamberlain, the most eloquent champion of the race theory and the Teutonic spirit, is himself an Englishman married to the daughter of Wagner (*alias* Geier) and that with quasi-Semitic assimilativeness he has written his book in German, after a career as a writer in French.

Not only is every race akin to every other but every people is a hotch-potch of races. The Jews, though mainly a white people, are not even devoid of a colored fringe, black, brown or yellow. There are the Beni-Israel of India, the Falashas of Abyssinia, the disappearing Chinese Colony of Kai-Fung-Foo, the Judeos of Loango, the black Jews of Cochin, the negro Jews of Fernando Po, Jamaica, Surinam, etc., the Daggatuns and other warlike nomads of the North African deserts who remind us what the conquerors of the Philistines were like. If the Jews are in no metaphorical sense brothers of all these peoples, then all these peoples are brothers of one another. If the Jew has been able to enter into all incarnations of humanity and to be at home in every environment, it is because he is a common measure of humanity. He is the pioneer by which the true race-theory has been experimentally demonstrated. Given a white child, it is the geographical and spiritual heritage—the national autocosm, as I have called it—into which the child is born that makes out of the common human element the specific Frenchman, Australian, or Dutchman. And even the color is not an unbridgeable and elemental distinction.

Nor is it only with living races that the Jew has manifested his and their mutual affinity, he brings home to us his brotherhood and ours with the peoples that are dead, the Medes, the Babylonians, the Assyrians. If the Jew Paul proved that the Hebrew Word was universal, the Jews who rejected his teaching have proved the universality of the Hebrew race. One touch of Jewry makes the whole world kin.

The labors of Hercules sink into child's play beside the task the late Dr. Herzl set himself in offering to this flotsam and jetsam of history the project of political reorganization on a single soil. But even had this dauntless idealist secured co-operation instead of bitter hostility from the denaturalized leaders of all these Jewries, the attempt to acquire Palestine would have had the opposition of Turkey and of the 600,000 Arabs in possession. It is little wonder that since the great leader's lamentable death, Zionism—again with that idealization of impotence—has sunk back into

a cultural movement which instead of ending the Exile is to unify it through the Hebrew tongue and nationalist sentiment. But for such unification, a religious revival would have been infinitely more efficacious; race alone cannot survive the pressure of so many hostile milieux—or still more perilous—so many friendly. The Territorial movement, representing the original nucleus of the Herzlian idea, is still searching for a real and not a metaphorical soil, its latest negotiation being with the West Australian Government.

But if the prospect of a territorial solution of the Jewish Question, whether in Palestine or in the New World appears remote, it must be admitted that the Jewish race, in abandoning before the legions of Rome the struggle for independent political existence, in favor of spiritual isolation and economic symbiosis, discovered the secret of immortality, if also of perpetual motion. In the diaspora Anti-Semitism will always be the shadow of Semitism. The law of dislike for the unlike will always prevail. And whereas the unlike is normally situated at a safe distance, the Jews bring the unlike into the heart of every milieu and must thus defend a frontier-line as large as the world. The fortunes of war vary in every country but there is a perpetual tension and friction even at the most peaceful points, which tend to throw back the race on itself. The drastic method of love—the only human dissolvent—has never been tried upon the Jew as a whole, and Russia carefully conserves—even by a ringfence—the breed she designs to destroy. But whether persecution extirpates or brotherhood melts, hate or love can never be simultaneous throughout the diaspora, and so there will probably always be a nucleus from which to restock this eternal type. But what a melancholy immortality! "To be *and* not to be"—that is a question beside which Hamlet's alternative is crude.

It only remains to consider what part the world should be called upon to play in the solution of this tragic problem. To preserve the Jews, whether as a race or as a religious community, is no part of the world's duty, nor would artificial preservation preserve anything of value. Their salvation must come from themselves, though they may well expect at least such sympathy and help as Italy or Greece found in their struggles for regeneration. The world's duty is only to preserve the ethical ideals it has so slowly and laboriously evolved, largely under Jewish inspiration. Civilization is not called upon to save the Jews, but it *is* called upon to save itself. And by its treatment of the Jews it is destroying itself. If there is no justice in Venice for Shylock, then alas for Venice.

If you deny me, fie upon your law!
There is no force in the decrees of Venice."

Even from the economic standpoint Russia with her vast population of half-starved peasants is wasting one of her most valuable assets by crippling Jewish activity, both industrially and geographically. In insisting that Russia abolish the Jewish Pale I am pleading for the regeneration of Russia, not of the Russian Jew. A first-class Ballet is not sufficient to constitute a first-class people. Very truly said Roditchev, one of the Cadet leaders, "Russia cannot enter the temple of freedom as long as there exists a Pale of Settlement for the Jews." But abolition of the Pale and the introduction of Jewish equality will be the deadliest blow ever aimed at Jewish nationality. Very soon a fervid Russian patriotism will reign in every Ghetto and the melting-up of the race will begin. But this absorption of the five million Jews into the other hundred and fifty millions of Russia constitutes the Jewish half of the problem. It is the affair of the Jews.

That the preservation of the Jewish race or religion is no concern of the world's is a conclusion which saves the honest Jew from the indignity of appealing to it. For with what face can the Jew appeal *ad misericordiam* before he has made the effort to solve his own problem? There is no reason why a race any more than a man should be safeguarded against its own unwisdom, and its own selfishness. No race can persist as an entity that is not ready to pay the price of persistence. Other peoples are led by their best and strongest. But the best and strongest in Israel are absorbed by the superior careers and pleasures of the environment—even in Russia there is a career for the renegade, even in

Roumania for the rich—and the few who remain to lead lead for the most part to destroy. If, however, we are tempted to say, "then let this people agonize as it deserves," we must remember that the first to suffer are not the powerful but the poor. It is the masses who bear almost the entire brunt of Alien Bills and massacres and economic oppression. While to the philosopher the absorption of the Jews may be as desirable as their regeneration, in practice the solution by dissolution presses most heavily upon the weakest. The dissolution invariably begins from above, leaving the lower classes denuded of a people's natural defences, the upper classes. Moreover, while as already pointed out the Jewish upper classes are, if anything, inferior to the classes into which they are absorbed, the marked superiority of the Jewish masses to their environment, especially in Russia, would render *their* absorption a tragic degeneration.

But if dissolution would bring degeneracy and emancipation dissolution, the only issue from this dilemma is the creation of a Jewish State or at least a Jewish land of refuge upon a basis of local autonomy to which in the course of the centuries all that was truly Jewish would drift. And if the world has no ethical duty to take the lead in this creation, it may yet find its profit in getting rid of the Jewish problem. Many regions of the New World, whether in America or Australia, would moreover be enriched and consolidated by the accession of a great Jewish colony, while to the Old World its political blessing might be many-sided. A host of political rivalries, perilous to the world's peace, centre round Palestine, while in the still more dangerous quarter of Mesopotamia, a co-operation of England and Germany in making a home under the Turkish flag for the Jew in his original birthplace would reduce Anglo-German friction, foster world-peace and establish in the heart of the Old World a bridge of civilization between the East and the West and a symbol of hope for the future of mankind.

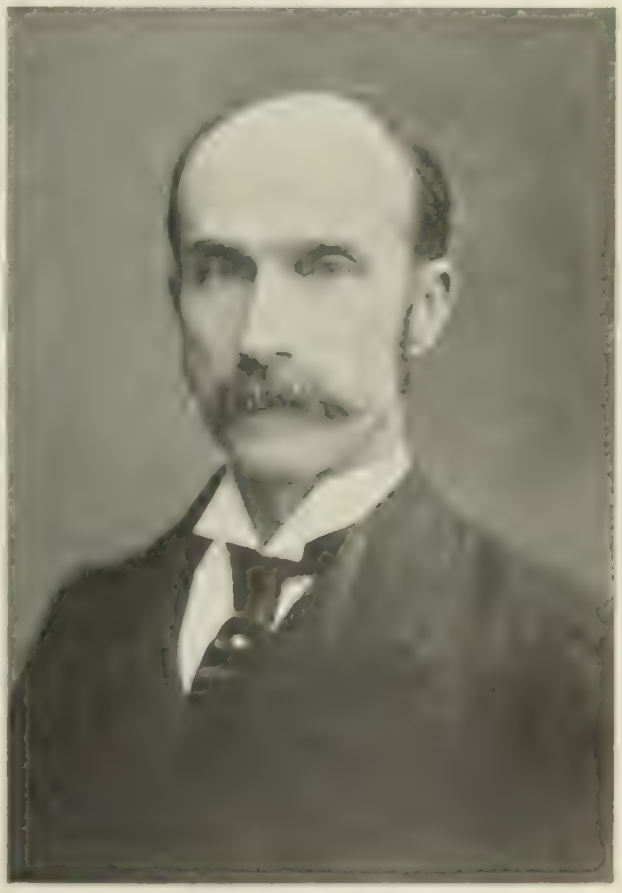
London, England.

# The Struggle Between Lords and Commons at Westminster

BY JUSTIN McCARTHY

THE struggle between the Peers and the Commons maintains itself quite steadily in England and without giving the slightest suggestion of any possible reconciliation or even up to the present of any chance of compromise. Everybody who knows anything about the whole subject knows that there can be no actual concession on the part of the representative chamber and that the hereditary law-makers would never surrender any one of their hereditary principles while there was the slightest chance of their maintaining it in defiance of any agreement of public opinion on the other side. I have conversed with many intelligent advocates of the claims of the still Upper chamber and with some intelligent members there are really, I may freely admit, many peers—tho very highly qualified and never could learn from them what compromise if any, they still hoped to make. All the world knows that the peers will have to give in at the last and the only really interesting question is how we can construct a second chamber which can discharge its real duties and yet maintain its real dignity. Yet if one recalls to mind the history of past events even in comparatively recent times he will see that at many a great crisis in the progress of modern reforms the peers have submitted to the most complete and prostrating defeat at the hands of superior power and yet were able to make up their minds to submit to their defeat and go on just as if nothing particular had happened. When the struggle went on for Catholic Emancipation the peers held out to the very last until the Duke of Wellington, who altho himself a devoted Protestant, acknowledged no championship of religious persecution, told the

VISCOUNT MORLEY OF BLACKSTONE



Government of the day that he felt assured the maintenance of the laws against Catholics must lead to a civil war and that in such a case he, the Duke, could not consent to lead the British forces against the enemies of religious liberty and equality. The Conservative peers of the present day probably had not this declaration of the great soldier duke in their minds or do not expect the prolonged and stubborn resistance of themselves and their allies, if they really have any allies, outside their own rank even in the hereditary chamber itself, and so they maintain and magnify their resolve at obstinate resistance to the proclaimed policy of the Liberal Government. Many of their supporters in the Tory press and in the Tory clubs keep on telling us that they are determined to do battle to the very last. Apparently the intention of the Tory peers is to force the country into another general election. Now my American readers must know as well as I do that the Lords have already forced the Government into two great general elections on this very subject and have given at each of those elections a most triumphant victory to the Liberal policy. What then can be the possible hope to be still entertained that a third general election on the same political question can end in anything but a third defeat even more overwhelming on the same subject? Even after all that has happened I do not think there is any very strong desire among the general body of Liberals in Great Britain to see the entire abolition of the second chamber altho it were to remain a chamber of members not elected but succeeding by right of succession. Yet, if the nobles of the present day should carry their insensate opposition to the new reform bill too far it seems to me not merely possible but highly probable that such resistance might ultimately lead to the formation of a new Parliament composed only of one house invited and authorized by popular election to carry on the whole political and other business of the country. As yet we know absolutely nothing of what the Tory peers intend to do and I can only conclude that they have not yet made up their minds on any policy.

The speeches delivered by Viscount Morley were among the greatest triumphs accomplished on behalf of political liberty during the whole of the present parliamentary struggle in Westminster. John Morley is indeed in every sense one of the very rare and therefore all the more conspicuous examples of the professional author and journalist who, having won a seat in the House of Commons, succeeded also in achieving for himself a recognized position as a parliamentary debater and even orator. The speech which he delivered only the day before this on which I am offering my tribute of admiration to it was one of the few bright and redeeming features of a long and for the most part unmeaning and unreal debate in the House of Lords. Thus far the Lords do not seem to have quite made up their noble minds as to the precise claim which they are according to their own judgment called upon to set up and maintain for the now hereditary chamber. To judge from some of the speeches delivered in the Upper Chamber it might be supposed that the majority of the peers had set their minds upon putting the country to the test of another general election. But it is hard, indeed

to understand how any peer could fail to remember that such decision has already been given twice and by overwhelming majorities during the last two year

"Home Rule is at our doors," said Lord Lansdowne last evening, but he would not admit that the Government had any mandate to settle the question. The "only way" to ascertain with any approach to accuracy whether the people wanted a particular measure was the referendum, and if the electors were to decide against Lord Lansdowne's party he "would do what he could to make the best of the new state of affairs." Apparently he felt the more free to make this avowal because of his conviction—or should it be hoped?—that Home Rule will never be accepted by this country. The speech was disingenuous. Lord Lansdowne protested that he and his followers fully admitted that adjustment between the two Houses was necessary, and that they were ready to meet the Government in a reasonable spirit. Their spirit of compromise is exprest in a series of amendments striking at the root of the Government's proposals. It is too late now to attempt to confuse the issue, but the effort was made last evening. The feeble charge was repeated that under the Parliament bill constitutional legislation would be left entirely to one House of Parliament. The powers of consultation and delay preserved to the Upper House by the bill are more highly rated by many of Lord Lansdowne's followers, and they prefer the measure to his own scheme of reform utterly wiping out the influence of the backwoodsmen. Lord Morley's task was not a heavy one. Lord Lansdowne had reiterated many shibboleths; had contended that the Government had no authority for thinking of a Home Rule bill, upon which the country had not been consulted. In the words of the leader of the Opposition, "the attention of the voters of the country was concentrated, not upon Home Rule, but upon what had been described as the conflict between the peers and the people." But Lord Lansdowne himself was one of the many Unionist peers who never tired of telling the people all that the conflict involved as to its consequences. Lord Morley quoted from one of his utterances on this subject. "What would happen," asked Lord Lansdowne, at Glasgow, on the eve of the last general election, "if this new dispensation came into force? Home Rule would go thru at once without further ado." Elsewhere he uttered the same warning. And now he pretends that the obnoxious mandate having been given it cannot be executed until Lord Cromer's joint committee, or some similar body, equally effective in superseding the House of Commons, has agreed to it. Lord Morley, who recalled that he was concerned in the manufacture of two Home Rule bills, characterized as absurd the pretense of the Opposition that they did not know what sort of measure the Government had in contemplation. But his most scathing and effective criticism had reference to the House of Lords as an assembly which could claim any knowledge of or sympathy with the needs of this country. With such a speech before them the friends of Liberty can have no doubt as to the ultimate issue.

It seems to me an event of much importance to the national cause that an article representing so thoroly and so faith

LORD LANSDOWNE

aptly the actual convictions of all true Irish Nationalists should have appeared in the columns of the leading National journal just on the eve of King George and the Queen's visit to Ireland, because it will enable them to understand most clearly the reality of the Irish national sentiment on the subject of Home Rule. George V has already made for himself in Ireland as well as in England the reputation of being a man of genuine intelligence, distinct independence of judgment, and force of character, and if on his first royal visit to Ireland he is enabled to learn by his own observation how distinctly the whole feeling of the vast majority of the Irish people is in favor of Home Rule it cannot but guide him in deciding as to the policy which it will be his duty and his pride to adopt in his direction of Irish affairs. We may well hope that the star of Ireland's national achievement is destined at last to rise upon the horizon. Now I can well understand the feelings of a considerable section of the Irish population belonging to what is called by a curiously artificial phrase the respectable classes, who object to a Home Rule government for Ireland because they do not want to see their native or their adopted country put mainly under the control of Irish ideas. But I cannot believe there is any resident Irish citizen who does not fully understand and recognize the fact, however he may grumble at it, that Ireland is quite clear on the question of Home Rule and is not to be turned against it by threat of penalty or expectation of reward.

We have not had much of a season for the publication of lighter literature during this year of so much political convulsion in Great Britain. I must call attention, however, to the issue of one novel by an author who I am sure is well known and is indeed a highly esteemed favorite among all Irish readers in the United States and Canada. The author is Mr. Percy White and the book I write of is called "The Broken Phial" and is published by Messrs. Constable & Co., London. Owing to the increased number of my political occupations during these last few weeks I have not been able even to read Mr. Percy White's romance, but I feel quite well qualified to invite attention to the mere fact of its publication as a literary event of distinct importance and I shall endeavor to do it something like critical justice in my next letter to THE INDEPENDENT. Percy White is among the most promising novelists of these days and I feel no doubt that he is already making himself well known and received with honors on the other side of the Atlantic.

LONDON, ENGLAND.

# From Inner Springs

BY CHARLES E. CRAVEN

THE march of progress in this school behold:
A noble edifice, equipt and fully manned,
A hundred times as costly as that planned
To educate the men who now are old.
But will the school a better manhood mold,
And will the rising generation stand
A hundred times as strong to bless the land,
A better, wiser race a hundredfold?
Nay, they are richer in material things,
In broader fields of knowledge lies their lot,
But if they stand strong as their fathers stood
'Tis all we hope. Worth wells from inner springs,
And still 'tis true, man's life consisteth not
In what he may possess of outward good.

MATTITUCK, N. Y.

THE CLUB HOUSE AT ARDEN.

# Arden: a Modern "As You Like It"

BY J. W. GASKINE

[The author of the following article is a veteran communist, and has spent much of his life in various kinds of social colonies.—EDITOR.]

IT is some nineteen miles from Philadelphia and a short mile from Harvey station, on the B. & O. Railroad to Wilmington, Del. It is in an old-time region of small farms. The soil is of good fertility and the turnpike, making a slight ascent from the station, passes between fields of corn, splendid in the massed beauty of their greenness, mobile in the breeze and rich in promise of the fall's husking.

Between these corn fields the turnpike, still slightly ascending, goes on by several small farmhouses, with flower gardens at their front. Here a wood's growth commences, some tall locusts of superb foliage line one side, and on the other, shortly beyond, appears a rude, rustic arch surmounting a narrow footway of crushed stone which enters some bushes at an angle, and looking along which glimpses are had of its leading to some sort of village settlement.

A large oak and some sturdy chestnuts upspring from the bushes stretch their limbs toward the entrance, and at the top of the arch is inscribed the invitation:

"You Are Welcome Hither"—

and on the inner side, where the eye would rest coming out—

"If We Do Meet Again We Shall Both Smile."

Thus you find yourself in Arden and recognize that there is a strangeness in it, or something different from the ordinary settlement.

It is not a great domain—but some 70 acres, of which a considerable part is a border of wood on either side of an open suitable for dwellings and gardens.

The open, flat or slightly rolling, is of no more than ordinary aspect, but the main wood, on one side, holds the look with its denseness and the great beauty of its glistening leafage.

A public highway passes along the wood, and from this highway paths enter it—faint trodden paths little more than a guide to the feet, which, like stealthy Indian trails, traverse the wood and wind about thickets and gray rocks

much as there a brook hidden there and making its way to the Delaware, quiet but persistent, and foaming little eddies of triumph about the rocks that would stop it. All is still within it, as if no one ever strayed there, but the wanderer along the trails will come suddenly from a loneliness to a bungalow or a cabin, and of a further loneliness in being not only out of sight from the open, but from each other.

These hidden and lonely habitations are the homes, it is said, of the first renters under the Single Tax, who, having a choice, sought the retirement of the wood, much in the spirit of the lay which Amiens sang in the Arden woodland of "As You Like It", readers of the play, no doubt, and caught by that call:

> Who loves to lie with me
> Under the greenwood tree
> Come hither, come hither, come hither"—

And there was the further lay yet more to the simple life, warbled by the cynical Jacques:

> "Who doth ambition shun
> And loves to live in the sun
> Seeking the food he eats
> And pleased with what he gets—
> Come hither, come hither, come hither—
> Here shall he see
> No enemy
> But winter and rough weather."

Inviting to the garden and feasts of turnips and greens. Yet tho the open land is favorable to the spade, and tho Bolton Hall has spoken eloquently to the settlement in urgency of "intensive culture" and the independence of the simple life, and tho the Single Tax declares a belief that men will swarm to the farm and the hoe when the personal landlord is no more, and good people secure of potatoes and cabbage under a rental tax only, voted by themselves for needed public work, the disposition at Arden seems not to arduous cultivation of the soil, and of the plots planted flower beds make the best showing and vegetables the poorest, with tall weeds calling more for the scythe than the hoe. But if the gardens are neglected, amusements are not, mixed spirits combining in this settlement named after that forest in which beauteous Rosalind made a merry adventure of love. From suggestion, or perhaps by a clever stroke of leadership, the theatrical cult is pushed, and every few days "The Merchant of Venice," "Romeo and Juliet," "The Midsummer Night's Dream," have a free public performance in an outdoor setting full of charm.

Under the very boughs of the wood a circular space has been latticed in, with seats about for spectators. In the center of the background there rises from a leafy border a gray rock just high enough and flat enough for a forum. On that rock Portia can pace, sure of the clapping of a group of black-haired Jewesses fled from haters of their faith in Russia; Rosalind can skip upon it with a bound from the hiding of the wood; and the happy children of this modern Arden troop about it delighted in "Midsummer Night's Dream," under red lantern light hung from the tree tops and wondering at the sparkings of the fireflies in the dark of that forest from which there come so many fairy things.

The theater gives joy, but a sterner spirit asks more; it asks equality and justice. This was the spirit of Henry George, this conceived the Single Tax, this established Arden. It might be called the socialistic spirit, the spirit of discontent among the workers, that spirit which demands that Society, that the great Whole, that Government, shall relieve individuals from cruel care-taking struggle for subsistence, doing for men what formerly it was supposed a God alone might and would do in another life. Arden, welcoming those of this spirit and soothing them with its entertainments, gives to their voices and likings a free rein, and all kinds of cranks find opportunity for the simple (or the simpleton) life—the free attire in shirt sleeves, or shirts without sleeves, overalls anywhere and at all times, dishabille for the females, with short skirts or the "new bloomers," which are baggy trousers to the knees, and then legs clad in tan stockings, or on occasions the flesh only.

Notable wanderer, drawn by this modern "As You Like It," the "millionaire tramp" released from a Philadelphia jail on bond, flees to Arden for a respite, and with a hoe chops down weeds for two days in an easy travesty of earning a living by hard work. Could anything

be more like Shakespeare's Arden, with Jacques singing:

"If it do come to pass
That any man turn ass
Leaving his wealth and ease
A stubborn will to please—
Ducdame, ducdame, ducdame
Here shall he see
Gross fools as he
And if he will come to me."

Amiens—"What is that ducdame?"

Jacques—"It is a Greek invocation to call fools to a circle. I'll go sleep if I can; if I cannot I will rail against the first born of Egypt."

Anarchism, too, finds a shelter. From a public road at a point where the wood touches it in a wettish swale there comes to view a faint path leading under bushes as low and dense as would screen the lair of some Hottentot. Two rough boughs, torn from some dead tree seemingly, arch over and mark this opening, and within there he lives—not the Hottentot, but the Anarchist. The house is but a rod in that thicket—a rough board cabin within which no despot rules that order shall prevail, tho a bright woman makes it hospitable. Clustering trees hang down scraping limbs on that roof and under it the Anarchist spends most of his time and drinks beer; or he sits outside on a porch and drinks it, while he cobbles. Not at all a ruffian in look, but of a genial bearing, bald-headed with marked Socratic features and brow, and a Socratic dialectic which pitilessly dissects socialistic chimeras.

The trail goes on; follow it by a flattish beach, where the wife of the Anarchist does her washing. Keep on thru the wood and by the habitations hidden on the brook's edge, with porches where the dwellers sit out to feel the sun gleams struggling thru the tree tops, to dine and smoke and chat and watch the ripples pass.

Further along the trail enters the brook, and stepping stones flung in invite the crossing to a rocky field which has a shut away and lonely look. A writer famous as advocate of fasting and health restored by nature cure, is sometimes seen there. He sits on the ground, pen in hand, his back to a rock. The loneliness, the damp of the ground, the hardness of the rock he leans against, the sun pouring on his hotless head, these evidences of nature as a curer appear to him as benefactions, refreshing, and giving inspiration to his unresting pen.

Jacques—
"A fool, a fool! I met i' the forest,
A motley fool; a miserable world!
As I do live by food I met a fool
Who laid him down and basked him in the sun."

Turn from the brook and take a path crossing the wood. The broken sunbeams fall on a brownish soil covered with a low growth of underbrush, among which show the tops of rounded rocks. Often after nightfall a camp fire will be set to some rock in a convenient hollow, and a huddle of adults and children will cluster round the blaze which lights the pleasure on their faces as old-time stories of Indians and the wilderness are told.

Keep on thru the wood and soon the path passes into a thicket of bushes which is the wood's border. Tents appear in the bushes and here the author of "The Jungle" (now an Ardenite) has pitched his camp. The five tents which

HELLING PEAS

before his household stand in line, with only a few feet between, and peering in the open flaps they look comfortably furnished. Externally the stained gray canvas, drabbly from the frequent rains, and bedding outside flung crookedly on sagging lines, give the look of an encampment of pioneers or a caravan of Mormons perhaps, stopped for a rest on the way to Utah. But from the tent at farthest end may emerge a female to dispel such illusion—the new woman, surely—young, of a good hight and shape, with nice brown hair uncovered, clad in the "new bloomer," but smiling to your glance and salute as might have Rosalind herself when she queried: "Tho I am caparisoned like a man, dost think I have a doublet and hose in my disposition?"

IN THE WOOD.

Across from the tents of "The Jungle" a smooth stretch of sward for games extends to a chief village road, on which face the inn and the Arden clubhouse.

The Arden Club is the instrument that plans and executes all that goes on in the way of entertainments. A card explaining the requirements for membership is hung conspicuously in a doorway which is generally open. The entrance fee is $3 annually, but the card further explains that this money is not all that will be called for from the member; that he or she will be expected to be merry, to dance, to take part in all the games and goings on, and to urge others to join and make merry too.

In reality the club is a parasitic culture which has lodged itself upon the corporate but somewhat inert Single Tax foundation of the settlement; and like most parasites, it is well nourished. In return it does an important work. The club entertainings have made the name of Arden widely known, they bring out a host of visitors, all of whom leave some money and some of whom rent lots. It is a scheme which succeeds and gives a summer of peculiar happy life to a number of men and women largely of a class who could not elsewhere find such joy of life within their means.

Similar entertainments, diversified with lectures and debates upon the social problems of the day, follow each other every evening the summer thru, and show how efficiently the club does its work.

As an example of the Single Tax in operation, successfully developing a considerable domain and providing workers opportunity to establish homes upon land, Arden is disappointing. An ex-

member states that the property was bought fifteen years ago by a Mr. Frank Stephens and a Mr. Will Price (supposably ardent Henry Georgeites), who "had the title made out to themselves as trustees, for those who should rent the land from them, on the basis of the Single Tax. There was a large mortgage on the property, which was later bought up by Joseph Fels, and the interest on this mortgage consumes most of the income of the colony. The lessees, at the annual meeting, assess themselves or appoint assessors, and accept or reject their ruling, and thus the whole matter of colony regulation and taxation is in the hands of those who lease the lots, except that the deed of trust provides that the tax shall be in accordance with the Single Tax system."

Fifteen years is a considerable time, but it appears that the mortgage still remains a monster absorbent of receipts from rentals, that the great production predicted, when land only and not the effects produced is taxed, has not followed, and that the trustees and the leaseholders have failed to place themselves in a position of independence as a land-holding company, and are at the mercy of a kindly millionaire maker of soap.

A recent publication from the association—*Arden Leaves*—prints the "Assessment of Arden land rentals for the year beginning March 25, 1911." This official statement describes that Arden has leased 125 lots, at an average rate of about 50 cents a thousand feet, or something like $22 an acre. The lot areas vary greatly, from 7,000 to 70,000 square feet. The last town meeting passed the following resolution: "That this meeting reaffirms the principle of communal rights on which this colony was founded, and the assessment should, in the language of the leases, equal as nearly as possible the full rental value of the land exclusive of improvements."

Much satisfaction is exprest at the large area of land held for common:

"Where can you find a community with so large a proportion of its area given for public use? Sixty-nine of Arden's one hundred and seventy acres are public." "In the financial statement you will find that not a penny goes for salaries and very little for administrative expenses."

To a sub-renter during the past summer the administration did not appear deserving even of that little. The administration of the public work seemed as inefficient as the club administration for entertainment was efficient. The only work shown was the putting a layer of crushed stone on some paths and a few culverts at wet spots. The men hired for this work could be seen languidly pushing the roller or sometimes leaning idle on their shovels for half an hour of gossip, nursing the easy job. And no correction of this made by any official, tho it must have made the little work done cost high, and suggests why, after fifteen years of organization, Arden is still a dependent mortgagee.

The rent of lots at an average above $20 an acre is too high for workers of the soil, and partly explains the little and imperfect cultivation. The leaseholders were in majority workers from the city who wanted a bit of land for a summer outing in tent, a lesser number of artists and actors attracted by the picturesque features, and a fewer number of considerable wealth, liking the freedom, and who were putting up some expensive dwellings, much to the disgust of the poorer and more radical renters.

Altho the settlement has been established so long, there is no public water supply, tho water is abundant close below the surface, and there is also a fall from the head of the brook. The villagers go with pails to some three or four pumps, in some instances near a quarter of a mile from the house. Early in the morning complaisant husbands or lovers are seen passing, with a pail in either hand, like Chinese coolies, hurrying to get home the water for the coffee kettle. Women and even children are thus seen as water bringers. The pump mostly favored is on a conspicuous corner, with a tub for drivers to water their teams. Toward the end of summer this pump got out of order and a placard was tacked on it explaining that it was not "the town pump, as erroneously supposed," but private property, and that users were expected to pay for its repair, and they were asked to sign below, which some dozen did.

The pump was out of service nearly a week, and the cost of repair set down

is at about 75 cents to each signer. But no one paid. Then another placard was tacked up:

"Help Assistance Service Aid!
The plumber must be paid
Cement costs money
So come along honey
With the promise that you made,"

and this placard remained in full view of the throng of visitors on the birthday of Henry George.

Such administration is obviously too great a blot on Arden not to be remedied shortly by the modern intelligence demanding waterworks, baths in the houses and sanitary drains. When it gets these improvements Arden may call a larger brotherhood to live "As You Like It" under the greenwood tree, as the old duke lived: "They say he is in the forest of Arden, and many merry men with him, and there they live like old Robin Hood and fleet the hours careless as they did in the Golden World."

A renaissance, to be possibly a Single Tax mythology in coming centuries and sung:

"Fair golden age when men ate only food
Of luscious fruit they gathered in the Wood,
Or stirred the soil in simple way to plant
Potatoes, carrots, beets, as busy as the ant:
When but a Single Tax allowed no wealth
To sever brotherhood and ruin health;
When pride of dress and hats to blind
Were not the tyrants of the woman mind—
But to buy real goods with honest toil,
Too wise to listen to the dealers guile;
When there were only honest folks who knew
No happiness but what from dances and Club
lectures grew.

ARDEN, DEL.

# A Song of Today

BY E. P. POWELL

NOT so long ago we pushed our feet toward the blazing pine knots of a New Year's eve; and you and I had a kindly talk, that is we of THE INDEPENDENT family. We are not quite like other magazine groups, but are something more of a family, and we can tell our experiences together like an old fashioned Methodist Love Feast. That is the way it was with us while the Old Year went out and the New Year came in. It is worth the while to love and be loved, and not to live and work alone.

You remember that while we chatted softly and swapped experiences, the Young Year came in upon us; a fine fellow, modest with his promises, but with a resolute look that pledged twelve months ahead of honest performance of duty. You remember also that when we asked of what is ahead, he only said, "Plow deep and much reap." Not one word could we get from him concerning political events, only this, "Remember to elect God;" and of social matters he had only, "Fall in with evolution." And you remember perhaps that when you inquired about crops and so forth, he said, "A farmer does not need that anyone shall tell him about what is going to happen in April and May and June. It is all charted out ahead for him—the early and the latter rain, the days for sowing and the days for reaping; only he must learn how to plow deeper, and to be on hand in time."

When questioned farther about the

future, the Young Year said, "It is the past that you can know and need to know, study that as your text book. The more you know of the future in any other way the worse it is for you." The pine knots snapped their fingers and cracked their knuckles, as if to say, Yes, indeed! there you have it. We have three hundred years in our bones, and it is worth the while to know even the history of a tree. Everything and everybody has a life to study, only they are off trying to find out what is not yet, and not remembering the *is*.

But, after all, did we not see somewhat into the future that night? One who studies his years that have been lived, gets a good deal of what is coming hereafter. It is the twos and twos of the past that make the fours of the days to come. To look back carefully and studiously is to look forward successfully, till finally we grow a prophetic sense; and this is increasing with each generation. A careful student is able to forecast the future without either goose bones or corn shucks.

This is about all the difference between folk: some forget or neglect experience, and study the changes of the moon. Every village has its prophets who are wise without knowledge, the guessers; and it has also those who study the future in what has already been discovered. Curran spoke of the twenty-six letters as the natural enemies of folly. Ten thousand books a year. Allow but one in a hundred to constitute a real addition to our knowledge, still we are getting steadily an increased power of foresight. You find this in our religious consciousness, which, beginning with the Ten Commandments, long ago added the Beatitudes and the Golden Rule; and will never be patient until these are worked into our everyday life. Already we have become certain that "All things work together for good to those who love God."

There really is a growing art of prophecy; a psychological power of foreseeing the future, and this is working its way into our lives. I heard two men disputing. One called the other impious and an atheist. But the other answered, "You depend on prayers; I on obedience. I trust the eternal laws written on the beautiful days and weeks; you trust your ability to persuade Deity to do your will. It is this splendid certainty in law that lets me put my foot down cheerfully just ahead in the unknown future. The voluminous past it is that gives us our language, our moral intuition, and our evolution altogether."

Yet it is this growing power to look into the future that makes also the worry and the fret of life—just this growing power to forsee consequences. It is a sort of Anglo-Saxon power at its maximum, and it has already led to insurance policies and old age pensions and to savings banks, and these are largely taking the place of prayers and psalms. The African knows and cares for none of these things. He sings as a bird sings over this year's nest; it costs little and the waste will be trivial.

Where will civilization take us after awhile? We have our long distance 'phones, and our long period weather forecasts; and these are growing longer, while calling in the planets as well as the sun to tell us what our next week's will be. Another thousand years will pretty surely enable us, not to guess, but to read from sunrise to sunset all the coming contents of an unborn day—things that will make us happy and things that will make us miserable. But will we be able to stop at that? Will we not be forecasting or forereading a full week ahead, and then a full month; and not be able to help ourselves?

But that unborn babes should feel this premonition of evolution before birth, that is the wonder of it. Yet it looks now as if those who are to be born hereafter will be doing just what babes always have been doing in the womb, inheriting as knowledge a good deal that their parents had to learn after birth, and to learn with great difficulty. It is not at all impossible that they will be born by and by able to read and juggle with letters, as well as to do a good many other things, by instinct. I mean that they will not have to learn their a b c's, as we had, at the knees of nurses, and with some propulsions of a physical sort, but that before birth they will inherit a knowledge of the alphabet and how to use it. How much farther they will go who can tell? It is true of our whole population that it is born a little riper than it was

at birth fifty years ago, as if we should put the first five years of life back into the womb. This has been Nature's method heretofore, and she will probably do the same thing again.

Perhaps something is due to our newer methods in education, which remove a good many of the old fashioned hindrances to going ahead. At any rate, there are accumulating records of good readers at two years of age. Young Sidis, at Harvard, is a better metaphysician at fourteen than Swedenborg was at forty, altho Swedenborg was abnormally precocious. An adult Bushman cannot count more than four, but an Anglo-Saxon boy of ten can count as many thousand as you require. He expects to become a millionaire, and no sort of figures and figuring can stagger him. A good deal of this work is prenatal, and more will be. At this rate the future boy, of the coming cosmopolitan race, will be a college freshman at six or eight years of age, and he will graduate at ten or twelve. I am not so sure however of this if our school children are to be kept on the irrational effort to learn how to spell the whole English language according to the dictionaries. This is a good fifteen years' job even for precocity.

What could one do anyway with a fully unrolled future? The great trouble with the religions of the world has been that they have turned away too sharply from the eternity behind, and have made too much of eternity ahead. Do not try to look too far; and for the life of me I cannot see why a man who owns up his ignorance is so much worse than a believer. It is with to-day that right religion has to deal; it is the duty within reach of the hands that belongs to us, and it is with no other duties that we have a right to spend our time lamenting. It is a wise necessity that is steadily turning us away from the fathomless eternity of future hopes and years. I think we cannot too often nestle at Nazareth with Him who told us that the whole volume of human obligation, was to drop out the contentions of the Councils, and do to others as we would have them do to us. I suspect that empty churches frequently mean Give us less of this awful unknown ahead; and give us more of the gospel of sunshine and to-day.

It must not alarm us that there does not seem to be quite as much piety in a hymn book as there once was, and more in doing the right thing at the right time; just working with God as little children. In this day of electricity and machinery, there is a poor chance for monks and anchorets, and for the exaltation of shiftlessness into saintship. Cursing a barren fig tree was a startling affair, looked at from the standpoint of the older creed, but Jesus taught a magnificent truth that there is no place in this world for the workless.

You and I have nothing to do with death till we get to the dying, and we must look out that we do not begin dying early in life, and so never be really and fully alive. In the old times, when I said the Lord's Prayer, I felt someway out of key with the words "Give us this day our daily bread"—just this day, and not a word about next month or next year. My religion was telling me to look a good deal farther ahead. "Daily bread" is hardly worth asking for, but now I better understand what the Master thought, and what he wanted to teach us. We are to avoid that dying that goes on every day, the rasp and file of vice eating into our wholesomeness, and leaving us to go on one-half alive or one-quarter alive.

I have a good deal of sympathy with Hale's maxim to "Look upward and not downward, outward and not inward;" but as for "forward and not backward" I think Mr. Hale was too good an historian to mean that for a general maxim. Lot's wife (I mean respectfully Mrs. Lot) was right as she wandered over the hills of Sodom, to think about the home she had left behind her. Would the biscuit burn while she was gone; or would the fire go out altogether in the kitchen stove? The good mother was probably the salt of the earth before they transformed her into salt altogether. I know some such women nowadays. It would be the most natural thing in the world to come home some day and find them pillars of salt.

The more I think of it the more I am sure that it is a beautiful thought to have us hemmed in from the things ahead—that is for the most part. One day at a time is about all that we can handle yet, and I wish that our schools would teach

the young folk less far reaching ambition. There are thousands of their presidents and senators and governors just graduating, but fortunately most of them will get into better business.

Look at it as we will, we get into the future fast enough, and here already we are in the middle of the year, that so short a time ago we greeted as new. We have gone half way around the sun; have rolled over one hundred and eighty times; have traveled about among the stars; have slept and waked, and been fed and flattered by Nature as her chiefest child. Some say half the year has gone; that is not the way to look at it; rather half the year has come. It is realized, it is a part of what is and eternally will be, and we all have our share in it. It is property. We are much closer other to-morrows, everyone full of throbbing events, but Nature will not trust us with one of them.

One little spot, however, cannot tell the whole story. I ate my strawberries in Florida in February, and my blackberries in April, but my Haverlands and William Belts waited again for me in the New York June; and in July my northern blackberries are still unripe. The fact is we have hardly begun to apprehend what to-day means. When I first went to Florida it was from the snow banks of a New York December, and that first Christmas under the orange trees, with all the roses I could desire and the violets in bloom, made it difficult for me to tell the yesterdays from the to-morrows. What really can one ask for except common sense to know how to use the beautiful days that this dear old world gives us so freely.

Nature has a way of loitering on some days, when she comes upon the roses and the sweet briars, with the crickets singing all night and the mockingbirds all day. She just sits still, or seems to do so, and lets things ripen. The corn grows six inches in twenty-four hours, and the honeysuckles woo the moths at midnight. You cannot keep up with a hoe; and you console yourself with the thought that Nature is getting tired creating, and there will soon be an end of it—except the "pusley," which always waits until everything else is through and then begins its growth. I always do my work with memoranda, and it is curious to see how very little ways ahead you can lay out your plans for the hoe and the cultivator. Your memoranda will have to be recast every night.

I like it well just now that the days have widened out so grandly, so that at four in the morning you and I can begin the day, and at noon hide ourselves for awhile from the heat of the sun. That is a wonderful experience, what we call the siesta, when we swing in our hammocks, on the broad verandas, with the Atlantic Ocean on the one side and the Gulf of Mexico on the other, to fan us with their breezes. With the sun at ninety at midday, we do not realize it; altho we wait until its rays are level across the lake before we take up our afternoon tasks.

When one comes to think of it, a single day is really enough to live at a time—that is if you get the whole of it. Get up at break of day; fill your lungs full of midsummer ozone; look God in the face; know that the sun is rising for you. Refuse to be one day older than you were, except in common sense; eat frugally of fruit and bread, and joyously join with Nature in making a day of it.

First I walk in my melon garden, enjoying the beauty of the vines, selecting the ripest and richest for myself and my friends, and then I listen to the hum of bees in the blossoms, and am careful to lay open here and there a ripe melon for the saucy mockingbirds. Bob whites call me out of the covers, and everything, everywhere, is crying, Rejoice! and again we say rejoice! Let us have nothing but golden days, one at a time. God is here quite as much as in the awesome by and by. A good steel hoe and something to do constitutes piety as much as a golden harp, and not a beetle to fight or a fungus to disturb your equanimity. I think I should not care for a heaven without hens to get thru the fences, and my collie Hector to drive them out. If once in awhile one's daily cares get too large for him, let him look up. The sky is always happy. Jesus noted that when He said, "Thy will be done on earth as it is done in the heavens"—that is, the sky.

Dear God of life and love! How wonderful was the moonlight last night! and this morning the robin song was as good as if it had never been sung before! I will remember never to use indelible ink

when I pray. Before night one may always find compensation for his troubles, or else at midnight he will be able to see something that he could not see at noon. Thank God for midnight, the midnight of old people, when we lie awake for awhile, and our problems are solved in the clearing house of Nature.

"Sufficient unto the day is the evil thereof"; sufficient unto the day is the good thereof. I do not say anything against precaution and foregathering. Every year should have an increment of credit and an increment of character—a little something over, as the good housewife keeps a bit of yeast to start the next brewing. So should every day have a margin of salvation; a fringe along the edge of it to keep it from raveling out; a few things done over; what our Catholic folk call works of supererogation; a few smiles caused here and there.

When one studies the past he does it in his memory and in books, but when he studies the future he does it with ghosts and magic. He asks questions, as if somebody else knew the unknown or could describe what has not as yet had being. I do not care for the prophets; they are all false prophets.

No, you are not right there, my friend; for the past also has to be found out. Today is like the sap wood of a big tree; it wraps about and is dependent upon the heart wood of the past, and the real aim of both is to reach up high enough to see over the intervening hindrances, up where the fruit is. The only trouble with the past is that as yet we have invented no sure way of disposing of its hates and its failures; its dead gods. What a curious thing is history! with a jumble of the good and the bad! Which are right, those who go there to recite the story of kings and wars; or those who go to resurrect newspaper gossip about common folk? I am inclined to think that there is no real history but that which goes to the past as a boy goes to the knees of a father, and seeks to find the lesson of things—what we call its philosophy.

Yet here we are with the complexity of modern civilization on our hands and in our blood. I have not yet heard of any one being turned into a pillar of salt for looking backward, but for looking ahead we have a good many turning into pillars of gold. What are we going to do about it? Shall we go on until we are all mere parts of a social machine, and so escape care and worry? The machine it is that will feed us three times a day; all the same porridge; and make us use our napkins an equal number of times. Such is the consoling dream of a growing crowd—a crowd ready to give up individualism and evolution, to get to the end of things, and there go to sleep. I have no other trouble with socialism only that it deprives me of trouble. I will bite the spoon that is placed in my mouth by compulsion.

I would rather have my own cow and my own bowl of peaches and milk, altho some day I may have but a pone cake in the ashes. If you are determined to bring all the world over to Thoreau or to the dweller in a flat, why I go with Thoreau, even to the banks of Walden Pond. The liberty of absolute equality is no liberty at all when it becomes compulsory. Liberty means a chance to differ, to work out the self that is in you. What would the world have amounted to if it had repeated an Adam or a Saul, to the end of time. In such a world Jesus could have had no interpretation and no misinterpretation. He would not have discovered the Golden Rule, or the Beatitudes.

Perhaps it will be the other way, that we shall go ahead until the crowd is more effectually a mass, a crushed pumice of humanity; and the wealth and the comfort is all in the hands of a small fraction. I do not believe either of these finalities; but so long as I believe in a divine life, in a God Father, I shall believe in the God children—that is, in the possibility of Jesus being born in the cradles of our Bethlehems. You have not had your last poet nor your last Christ. God begets himself continuously. To have really got to a point of letting the future alone, and not trying to modify it in any way, or to worry over it with our plans and our prayers; just to do our duty and go ahead smilingly, that is the great achievement.

The future! It is the rising sun. See it look over the horizon; and lo, rising, it *is* today. The future! It is the New Year that stealthily entered while we sat by our new year's fire; but already half of it is in the past. To perpetuate the

present is exactly what Nature abhors. Photography that does not express art and science gets stale as quickly as the housewife's new bread. Nothing shows more evolution than the work of the camera. It is hardly possible for us to keep still long enough to have our pictures taken. Do not worry about next year; you will soon be there. Only keep your tools sharp. Plow deep today so that you shall reap a rich harvest tomorrow.

SORRENTO, FLA.

# The Home Daughter Again

BY CLARA E. HUDSON

[In our issue of July 13 Marion Harland deplored "The Passing of the Home Daughter." That article elicited several interesting letters from "Home Daughters" and others. We regret we have space to print only the following from Miss Hudson.—EDITOR.]

WITH Marion Harland I, too, deplore the present state of affairs, in which so many girls leave their homes to engage in teaching or in other lines of work. But it seems to me that those who are largely responsible for this condition are the *mothers*. When their daughters are young they fail to interest them in household affairs, and do not encourage them in acquiring a knowledge of cooking and housework, excusing themselves on the ground that "it is so much easier to do things one's self." Later they expect that girls, whose minds and bodies have been used to regular training in school and college, will be satisfied to stay at home and help in small ways.

Like "Isabel's" mother, mine also anticipated, thru the four years of my college life, the day when I should again be free. She realized, however, that no vigorous girl of twenty of the present generation could be content to settle down into a life that offered no substitute, in physical and mental energy, for that she had just left. She therefore resolved to put the housekeeping into my hands, giving me first charge of the commissary, while she still superintended the cleaning. I was given a stated allowance every month, sufficient to pay all my own expenses and to lay a little aside in the bank. I was to pay all household bills, and at the end of the month I was reimbursed for the part that had been spent for the other members of the family. In this way I came to know the cost of everything, from pew rent to potatoes; I was perfectly free to seek my mother's advice and help at any time, and she was ready to take charge whenever I wished to go away on a visit.

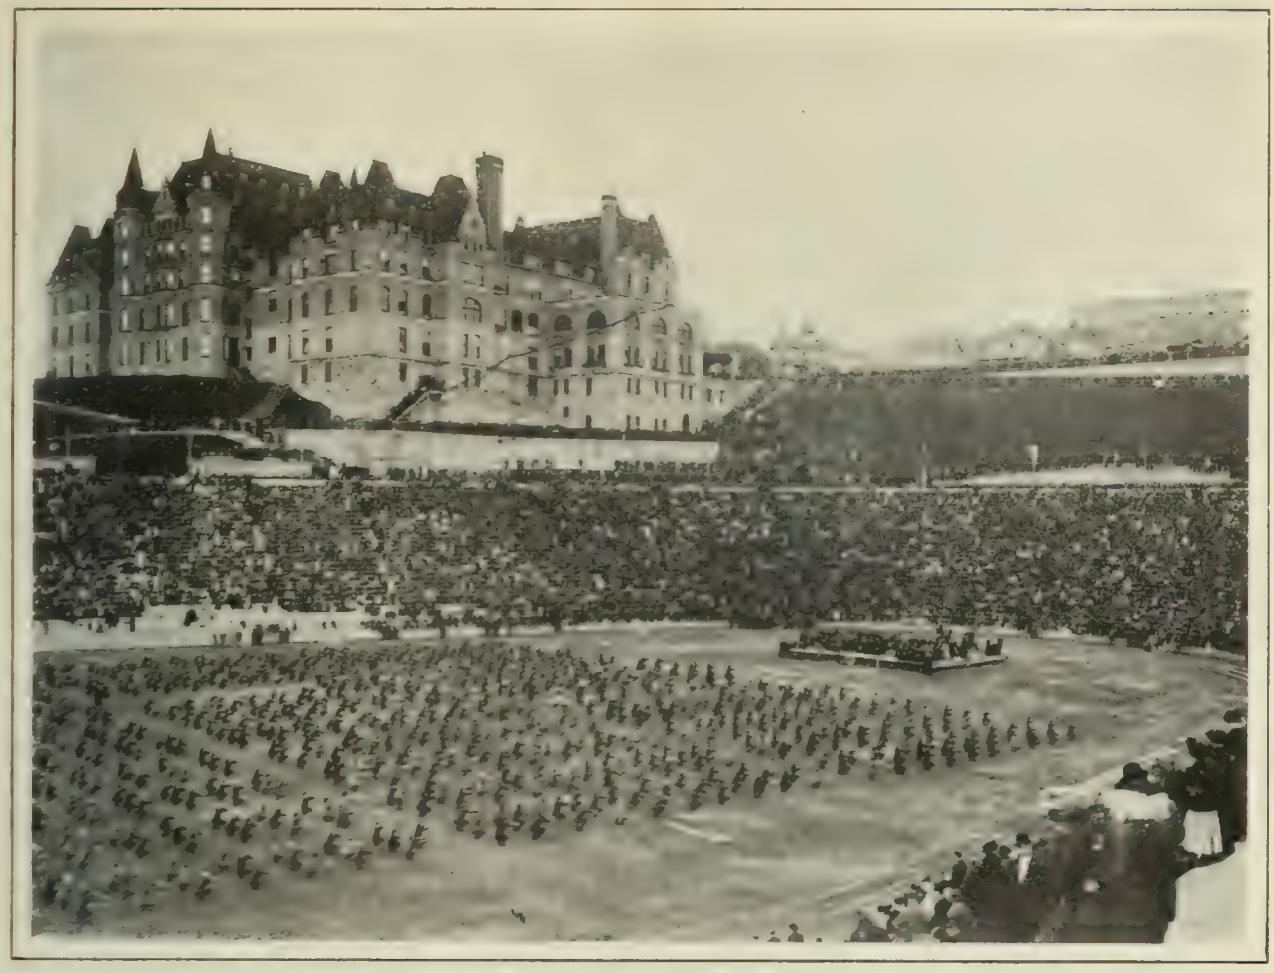
My mother soon taught me to realize that housekeeping is a science, and that making good bread is a thing as much to be proud of, as reading Greek. She, too, was a college girl and believed that a college training should make one better able to solve every day problems. She showed me how necessary it is to plan meals which are well balanced, with neither too much nitrogenous food nor an undue number of starchy dishes. When abroad, I have eaten a lunch that began with macaroni, had potatoes with the meat course, and a dessert based on rice. I have also had many a dinner that had a meat soup, besides meat, vegetables—all of which were nitrogenous, such as beans, cauliflower, etc.—and a dessert formed largely of eggs and milk. No wonder I longed for home cooking and the good digestion resulting from it!

With such a teacher, home became to me a more interesting school than any I had passed thru, and housekeeping an absorbing vocation. Why do not more mothers follow this plan with their daughters? Not one in ten is willing to do so, whether from a fear of "being put on the shelf," or because they have no resources in themselves I shall not try to decide. They are certainly failing to do their duty. How is the coming generation to have wise, sensible, cultured mothers if our better educated girls are not trained to care for the home life which is a woman's truest sphere?

AUBURN, N. Y.

# The Tacoma Stadium: A Lesson in Civic Patriotism

BY CLARENCE GREEN



IT is refreshing in these times of "pork-barrel" politics," when greedy municipalities vie with one another in grafting for national aid, to find a self-reliant community that can undertake a great public enterprise and finish it in a clean and creditable fashion. The manner in which the citizens of the vigorous young city of Tacoma, Washington, completed the High School Stadium furnishes a lesson in civic patriotism that is both interesting and instructive. This magnificent structure, composed of 600 tons of steel and 600 barrels of cement, on the site of what was formerly a gulch in the cliffs of Commencement Bay is a glorious monument to the loyalty of the self-reliant patriotism of the Tacoma "boosters."

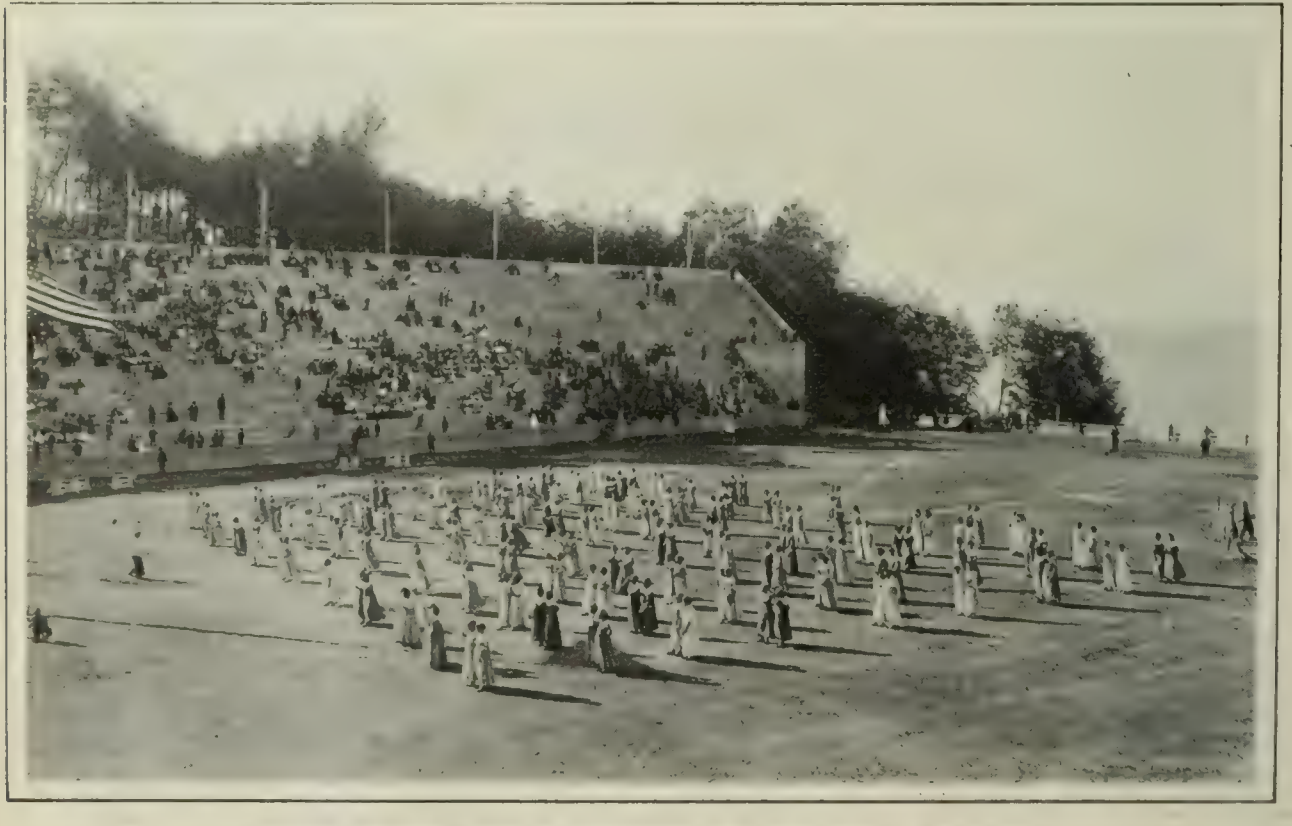
The story of the stadium proves conclusively that Tacoma is a city of "boosters." And all of the "boosters" big and little in this sturdy young city of the West aided in the great work of building the stadium. The boys and girls of the Tacoma public schools played no small part in the stadium campaign. In fact the two thousand students of the Tacoma High School were in the van of the stadium fight from start to finish. The two impressive and enthusiastic parades of high school students and teachers through the business section of the city, September 19 and October 6, 1909, were what gave the campaign its initial impetus and assured its successful completion. These student parades and the enthusiastic mass meetings in the High School Auditorium taught practical lessons of city patriotism to the coming citizens of Tacoma that will bring forth great results. The High School students furnished not only enthusiasm and noise, however, but they also by their own personal efforts raised $25,000 of the stadium fund. On the day of the big stadium parade the student solicitors recured $2,000 and in three days they obtained pledges for $9,500.

The "Father of the Stadium," however, is the school architect, Frederic Heath, for it was his mind that first conceived the project of transforming "Old Woman's Gulch" into a beautiful stadium. After him among the leaders comes the then Superintendent of City Schools, A. H. Yoder, who is known as the "Step-father of the Stadium." J. G. Collicott, then principal of the Tacoma High School and at present the Superintendent of City Schools, was also among the leaders of the enterprise as were also all of the members of the High School Faculty. The Stadium Committee composed of S. A. Perkins of the Commercial Club, R. L. McCormick of the Union Club, John Ray of the University Club, E. E. Horgan of the Chamber of Commerce, A. L. Sommers of the High School Faculty, W. S. Broenkow of the Alumni Association, Justin Hill of the Student Body, and M. L. Clifford of the Board of Education furnishes a fairly representative list of other important leaders of this great civic undertaking. This committee secured $50,000 of the subscriptions for the $110,000 stadium fund leaving only $60,000 to be taken from the tax levy.

The manner of raising this fund was novel and interesting. To every one who contributed $10 was given a ticket of admission good for five years for all stadium events. Some of the larger contributors, however, did not take their full proportion of tickets, so at present there are only 3,300 of these five-year tickets outstanding.

With characteristic Western frankness the people of Tacoma rejected the proposal to have a private corporation build the stadium and pocket all the profits for a term of twenty years. The people would have nothing to do with this franchise project but wanted a stadium built and conducted along the lines of muni-

TACOMA SCHOOLBOYS GIVE AN EXHIBITION DRILL.



DEDICATION FIESTA: DRILL OF SCHOOL CHILDREN.

cipal ownership. The building of the stadium under the direction of the people has been a great success, entirely free from graft or any kind of corruption. The citizens can now point to the splendid structure with a feeling of pride in the honesty and enterprise of their municipality.

The mammoth completed structure with its six miles of seats overlooking the shipping of Commencement Bay is a sight worth traveling far to see. The open end of the horseshoe-like structure gives an excellent view of the dark, tranquil waters of Puget Sound. On the right rising from the purple wall of the Cascades may be seen the towering mass of majestic Mount Tacoma, while on the left toward the great Pacific are the graceful snow-capped peaks of the rugged Olympic range. The dimensions of the stadium give some idea of its capacity and proportions. The arena of 2 6-10 acres exclusive of a 16-foot 5-lap running track is 400 feet wide at the open end facing the bay and 250 feet wide at the narrowest point. Rising above the green turf of the field are the tier upon tier of thirty concrete seats, 18 inches on the perpendicular and 27 inches on the horizontal. Leading upward from the topmost seat, which is 52 feet above the level of the field, are the two winding concrete stairways to the street, which is 43 feet above the top seat. Just above the top row of seats is a broad, bulwarked promenade of concrete from which open at regular intervals twenty-nine gateways to the rows of concrete steps descending to another bulwarked promenade at the bottom.

One should, however, have seen the wild tangle of the "Old Woman's Gulch" in order to completely realize the significance of the finished structure. The difficulties in the way of the enterprise seemed in the beginning almost insurmountable, but the men of the Northwest, who are accustomed to conquering giant forests and sluicing down hills, were not daunted. Hydraulic pressure, the steam shovel, and dynamite all aided in the herculean task of transforming the gulch into a beautiful and artistic stadium. The contractors commenced work on the stadium April 1, 1909, and the work was ready for dedication June 10, 1910. Besides the work of erecting the great structure of concrete and steel, 180,000 cubic yards of earth were removed and a fill of 147 feet was made in the deepest portion of the gulch.

The Stadium Fiesta of June 10 and

HIGH SCHOOL GIRLS PRESENT THE COLONIAL MINUET.

11, 1910, in which 7,000 school children participated was a fitting dedication of this great municipal enterprise. The drills, marches, and games of the children in gay and various colored costumes presented a picture that will not soon be forgotten. Crimson-clad school children to the accompaniment of jingling spangles and tambourines went through the intricate mazes of the Spanish dance; flaxen-haired little sons and daughters of Scandinavia presented the dances and drills that have made Swedish physical culture famous; to the droning of the bagpipe Scotch lads and lassies gave a vigorous presentation of Highland grace and agility and hundreds of High School maids in quaint Colonial costumes charmed the audience with the beauty of the court minuet. There were athletic games galore for the boys and field meets with neighboring high schools. And the fiesta netted $1,500 for the school fund of Tacoma.

The Stadium is the property of all the people of Tacoma and the problem which now confronts them is how best to use and enjoy it. The prosaic materialism of the modern age is hardly accustomed to producing spectacles that harmonize with this beautiful setting. The military tournament given in the stadium last summer by troops from all arms of the service from the Department of the Columbia was a pleasant and inspiring spectacle. But the most inspiring stadium scenes for the people of Tacoma will no doubt be found in a repetition of the pageants presented during the dedication fiesta by the children of the Tacoma public schools. Situated as the stadium is at one of the nation's leading gateways to the Orient, it would be an ideal place for a grand international tournament where the military, athletic, educational, and fraternal forces of Orient and Occident could be represented.

TACOMA, WASH.

# Turkey's New Method of Conquest

BY HERBERT ADAMS GIBBONS

THE astonishing progress of the peace movement thruout the world during the past year has certainly had its influence in Turkey, despite the bellicose attitude of the Young Turks toward Europe and the fighting in Albania and the Yemen. The recent peace-making visit of Mohammed V to Macedonia and Albania is an event as epochmaking for the Ottoman Empire as the proclamation of the Constitution three years ago.

For several months before the outbreak of the present Albanian revolution it had been decided by the Ministry that the Sultan should make a tour of Macedonia and Upper Albania in June. It was hoped that the loyalty and enthusiasm of the people might be awakened by the presence of their sovereign, and that he might succeed in reconciling by love rather than by force of arms the elements which have been so long warring against each other and against the Government in that unhappy region. Such a project was unique in Ottoman annals, and so contrary to Turkish nature and methods that it was universally considered as absurd. When the news came of the outbreak in Albania there were many who said: "It will be easy now for the Cabinet to cancel the Sultan's trip. It can be done with good grace, and the people will still think that the journey was seriously contemplated." But, in the face of all the difficulties of the undertaking and the real danger which it involved, the journey was carried out just as it had been planned.

On June 7, Mohammed V, escorted by a squadron of warships, left Constantinople by water, and was enthusiastically welcomed the next day at Salonica, where Abdul Hamid from his prison could see the bonfires and hear the acclamations which greeted his successor. Never has Salonica witnessed such festivities. Two days later the Sultan entered Uskub, of revolutionary reputa

tion, surrounded by officials of his court and an unarmed populace. From there he went boldly on to Prichtina, which is not far from the scene of the present rebellion.

On June 15, on the plain of Kossova, Mohammed V, as Caliph of the Faithful, led 200,000 Albanian Moslems in their Friday devotions. On this very spot, in 1389, his ancestor, Murad I, had fallen in the great battle which won for the Turks their empire in Europe. On the same field, in 1444, Murad II had successfully defended against the last crusaders the Turkish domination of the Balkan peninsula. In 1911, in a desperate attempt to retain his heritage, comes Mohammed V to Kossova without arms and bringing the olive branch. Appealing to their religious and patriotic sentiment, he calls upon those with whom he has just prayed to sustain and preserve the last remnants of the empire in Europe. The majority of his auditors are men who were yesterday fighting against the Turkish army and who are probably meditating a renewal of the rebellion tomorrow!

From Prichtina the Sultan returned to Uskub and Salonica, and then went to Monastir, unvisited by an Ottoman Sultan since the time of its incorporation in the empire four hundred and fifty years ago.

At every stopping point the Sultan was accessible to the common people. He bestowed his greetings and gifts and granted audiences to all the elements without partiality. Political prisoners of all nationalities and confessions were pardoned, injustice righted after personal investigation, schools established and alms given to the poor. The response made to the addresses of welcome from the municipalities was always the same: "I am come among you to plead for peace and unity, for the spirit of love replacing the spirit of hate. Let there be mutual forgiveness for the past. My coming is a proof of my interest in my people. I am the father of all alike."

But words are easily spoken and rarely meant in Turkey. They would have made no impression if they had not been backed by deeds. At Keuprulu, the Sultan was so touched by the salutation of a small Bulgarian boy that he ordered the child to be educated at his expense. At Salonica, he gave the first greeting and closest attention to the children from the Jewish schools. At Kossova, to prove the sincerity of his desire for peace, he proclaimed a general amnesty for the Albanians in revolt, promised to grant their demands for fiscal and educational reforms, and offered from his private purse the sum of 10,000 pounds ($44,000) for the rebuilding of homes and churches and for the restocking of farms which had been destroyed or damaged during the rebellion.

I have just witnessed the return of Mohammed V from this memorable journey. Constantinople, Scutari, and the Bosphorus and Marmora villages took a holiday to greet their conquering sovereign. There were flags, illuminations, fireworks, bands. Seraglio Point was crowded by the hundreds of thousands (I do not think I am exaggerating) who had been waiting long hours for the squadron to appear on the horizon of the Sea of Marmora. Neither Mohammed the Conqueror nor Soleyman the Magnificent had ever received such an ovation. When I realized the actual meaning of this welcome home I could hardly believe that I was really in the Constantinople whose whole history is that of might making right. *These people were greeting the first Ottoman Sultan who had gone to conquer without a sword in his hand!*

Let us put to one side the practical result of this journey. The Albanians are still fighting as hard as ever. Its purpose has not been immediately and fully attained. But the significance is in the fact that such a journey was conceived and undertaken at all. The spirit of the twentieth century is peace, and that spirit is worldwide.

Robert College, Constantinople, Turkey.

## A Famous British Journalist

Only two British journalists—Delane, who was for thirty-six years editor of the *Times*, and Sir William Howard Russell, who for about as long a period was the most famous of the *Times* special correspondents—have been commemorated in two-volume biographies. But there will be no criticism of Mr. Atkins for the length of his book; for if the lives of Gladstone and Parnell are excepted it would be difficult to recall a British biography published within the the last ten years that appeals to more readers than will the *Life of Sir William Russell.** Russell was a man of strong personality. In the work in which he was the pioneer—that of war correspondence—he was a man of great achievement; and for forty years his life was full of stir and danger. In a word Russell was an excellent subject for a biography; and Mr. Atkins, who himself has seen service as a war correspondent, has made the most of his great opportunity. He claims for Russell that in the Crimean War he "saved the remnant of the British army"; that his first letter from Cawnpore during the Indian Mutiny ended the policy of indiscriminate executions; and that in the Civil War in this country he helped Englishmen to change their minds, and to see that the Federal cause was the cause of justice and truth.

Yet Russell was one of the many men who have drifted into journalism. It was not until he went to the Crimea in 1854 that his fame as a descriptive reporter extended beyond the *Times* office. Twelve guineas a week was the salary at which he was engaged for this work. It may have been increased as the war dragged on; but it was as a reporter on a salary of twelve guineas that he made himself famous, added enormously to the already high reputation of the *Times*, and by his letters describing the chaos of the British army organization brought about the downfall of the Aberdeen Government.

By members of the Government and at the War Office in London, and by some of the British officers of high rank in the Crimea, Russell at this time was more hated than any journalist of his day or since; and for most of the time while he was with the troops he was made to feel this, and every obstacle was thrown in his way. But Russell was convinced that he was serving the English people as distinct from the Government or the War Office, and he was upheld by Delane, who had the fullest confidence in his judgment and integrity. Russell, who during his long life saw more of war in three continents than any other man, had a hatred of war. Its sordidness and its ferocity always impressed him; and he did more than any other man since war began except perhaps Verestchagin to strip it of its glamour and its so-called glory. This attitude of Russell toward war comes out strongly in his letters to his wife from Balaclava. He told her of the good friends he had lost—"the dear companions of many a ride and walk and lonely hour." "I have seen them," he continued, in this letter of November 5, 1854, "buried as they lay all bloody on the hillside, amid their ferocious enemies, and I could not but exclaim in all bitterness of heart, 'Cursed be he who delighteth in war.'"

The story of Russell's work and experiences in this country during the Civil War, as told in much detail by Mr. Atkins, has an interest apart from that of Russell's varied and strenuous career as a newspaper correspondent. It throws some new light on the attitude of the *Times* and of the aristocratic classes in England who then sympathized with the Southern Confederacy. In the early weeks of January, 1861, when the crisis was impending, the *Times* was not a partisan of the South. It then said:

"We cannot disguise from ourselves that there is a right and wrong in this question, and that the right belongs to the States of the

*The Life of Sir William Howard Russell, The First Modern Correspondent. By Fox Bourne. With Portraits and Illustrations. Two Volumes. New York: E. P. Dutton & Co. Pp. xviii, 393; vi, 413. $10.

North. The North is for freedom of discussion and the South resists freedom of discussion with the tar brush and the pine faggot."

But by August, 1861, the *Times* was on the other side, and how far Delane sympathized with the South may be judged from his letter to Russell concerning his story of Bull Run:

"I can't describe to you the delight with which I, and I believe everybody else, read your vivid account of the repulse at Bull Run, and the terrible debâcle which ensued. My fear is only that the United States will not be able to bear the truth so plainly told. As to their girding against us, the pretty little fleet we already have in those waters, acting in concert with Mr. Jeff Davis, would raise the paltry blockade and turn the tables against them in a week."

Six months later Delane discharged Mr. Davis, the New York correspondent of the *Times*, and sent from London Charles Mackay to replace him. "Davis's proclivities," he wrote in explaining the change to Russell, "were entirely Northern, and he gave them expression to the exclusion of all other. I fancy he believes even now—February, 1862—the Union to be triumphant, and solid—a delusion shared by no one on this side of the Atlantic." Delane, like Palmerston, was anxious that the South should win. He had convinced himself that there could be no other outcome of the Rebellion. Russell could not move him from this conviction. He held it to the last; and at the end of December, 1864, when he had the news that Sherman was at Savannah, he wrote, "The American news is a heavy blow to us as well as to the South," that he was "sore vexed about Sherman," but that Chenery (an editorial writer on the *Times*) had done his best "to attenuate the mischief."

Russell's description of Bull Run was as disturbing at Washington as his letters from the Crimea had been to the Aberdeen Government. It must have been written in much the same spirit; and there were among his American friends, men such as John Bigelow, who always held that when Russell was refused permission to go to Fortress Monroe, he was punished not for what he himself wrote, but for what appeared in the editorial columns of the *Times* for which Russell, as is now clear, was in no degree responsible.

One incidental proof of Russell's sterling independence was his willingness to take a stand and adhere to it when it was not the stand of the great newspaper with which he was so long identified, and for which he did more than any man who had not served as editor. As late as December 8, 1862, he doubted whether the Union could be restored; but he had an intense hatred of slavery and his sympathies were with the North, and when all was over he regretted that the *Times* had not taken his advice, and he claimed—June, 1865—that if ever he did state service it was in his letters from America written between March, 1861, and April, 1862.

## A Sculptor on Art*

"YES, there is always Rodin, the greatest sculptor of his age," writes Mr. Huneker—and a book of conversations with Rodin on the subject of his art is, one has a right to assume before even opening it, worth a careful reading. It so happens that this book of *Entretiens* is so remarkable a volume that it would be worth that reading, whatever the name on the cover. Many, in reading it, will for the first time have a first glimmering of what art is, and tries to be.

So informal is its mold, the only way of arriving at some idea of its content would be to quote copiously. This one could do to good effect. The admirable simplicity of the book is one of its merits. It shows a fine contrast with the vaporousness of most art criticisms and causeries.

Rodin is, to be sure, no academician. He would not accept at its face value Lessing's dictum: "Ugliness in itself should not form a suitable subject for poetry," but would point out that Lessing added that even Homer "painted extreme ugliness," and quoted Gloster's speech out of Shakespeare's "Richard III." "Painting," said Lessing—and no doubt meant to include sculpture, too—"as an imitative power, can express ugliness; as a fine art it refuses to do so. In the former capacity, it has all visible objects at its command; in the latter, it confines itself to *such as awaken pleas-*

*Auguste Rodin: L'Art. Entretiens reunis par Paul Gsell. Paris: Bernard Grasset. 6 francs.

*ant sensations.*" But Rodin plays another tune. "In art," he says,

"only that is beautiful which has *character*. . . . And that which is considered ugly in Nature often presents more *character* than that which is described as beautiful. . . . There is, in Art, nothing ugly but what wants character: that is, what offers naught of exterior or interior truth. The ugly in Art is the false, the artificial, what essays to be pretty or beautiful instead of being expressive. . . . When an artist, in the intention of embellishing Nature, adds green to the springtime, rose to the dawn, purple to young lips, he creates ugliness *because he lies.*"

One need not accept as gospel all that Rodin tells M. Gsell, his interlocutor, and the classicist may find fault with many of his declarations. The classicist does find fault, indeed, and in the remarkable essay of Prof. Irving Babbitt, entitled "The New Laokoön," we read:

"Rodin and other impressionistic sculptors are straining so hard to be vital and expressive that they are in danger of overstepping the bounds of their art . . and so of failing to temper their rendering of life and motion with a sufficient suggestion of repose."

WILLIAM J. LOCKE

Yet what M. Rodin phrases here of his own aspiration and achievement is almost immeasurably suggestive, both technically and, if one may say so, philosophically. To classicists and apostles of restraint like Professor Babbitt, no less than to all of us who are interested in the modern forms of art with which he, for one, is so little sympathetic, the chapters on "Models," on "Repose and Gesture," on the failure of photography as an artistic medium, on successive phases of action in one composition, must prove wonderfully illuminative. This book is beautifully printed and illustrated.

**The Glory of Clementina.** By William J. Locke. New York: John Lane Company. $1.30.

In his latest novel, Mr. Locke has taken a woman for the hero. The word "heroine" does not suit Miss Clementina Wing, who is of lofty and stern characteristics; a portrait painter of masculine genius; utterly reckless as to personal appearance; careless of speech; with a large and liberal attitude toward the conventionalities. A homely, dark face, hair never in order, blouse gaping at the back—her own portrait is not attractive as she is sketched in with quick and skillful strokes of Mr. Locke's brush. Yet we love Clementina from the first page to the last, which celebrates her apotheosis. Back of the almost sexless painter with her rough tongue always stands the tender-hearted woman with wistful eyes. She mothers everybody—Etta, Tommy and Dr. Quixtus, who would have fared ill at the hands of life but for her rescue. A sharp tragedy at twenty had severed Clementina from the usual destiny of young girls; her bitterness and sourness were only the encrustations that time had cooled over the hot lava of her heart; the fire had not died out beneath. "Genius!" said Clementina. "I can't be a genius for the simple reason that I'm a woman." . . . "Woman has always her sex hanging round the neck of her spirit." Clementina gives us her definition of genius: "The quality the creative spirit assumes as soon as it can liberate itself from the bond of the flesh"; and her idea seems to be that the mother hunger of even the greatest woman hin

der her creative work in other lines. What woman would not rather hold a real child in her arms than to paint its portrait, even tho that picture might prove the greatest painting the world possessed? Somehow, we hope that Clementina may manage to accomplish both, in spite of her skepticism. The sub-hero, Dr. Quixtus, is the gentle, unworldly, lovable and half-helpless character that Mr. Locke has endeared to us in several of his more notable novels. The bewilderment of a trusting spirit when it makes a personal acquaintance with treachery is apt to take some form of eccentricity, and the more loving the spirit the greater the shock of its contact with evil. The monomania of Quixtus takes the form of a settled plan to revenge himself on the world by becoming cruel himself. Even Mr. Locke's skill in eccentric psychology scarcely makes credible his schemes to do evil in return for the wrong done him. The novel is ripe fruit of a delicate and happy genius. Mr. Locke is the Cervantes of another guileless Don Quixote. But Clementina is the glory of the book.

**The Book of Decorative Furniture:** Its Form, Color and History. By Edwin Foley. With One Hundred Reproductions in Full Color Facsimile of Drawings by the Author, and One Thousand Text Illustrations; Correlated Charts of British Woodwork Styles and Contemporaries; Decorative Furnishing Accessories; Principal Trees, etc. In Two Volumes. Vol I. 4to, pp. xv, 427. New York: G. P. Putnam's Sons. $7.50.

Of all the succession of volumes, English and American, on furniture, this is the most superb. The work will consist of two volumes, of which the first carries the history of furniture, mostly British, down to near the end of the eighteenth century, and so does not reach the time of Chippendale, Heppelwhite, Sheraton and Adam, or the Empire style. That will give plenty of matter for the second volume. This volume has fifty richly colored plates and five hundred drawings inserted in the text. We are willing to have the first chapter touch but imperfectly on ancient Egyptian, Assyrian and Greek furniture, that fuller space may be given to that of more modern times. The colored plates are most elaborate. The selections are from the choicest treasures of royal and ducal palaces, in colors to represent them, not in their present deadened color, but as they were when new in rich wood, and inlay, and lacquer, and embroidered stuff; and the background is selected from the furnishings of court halls of the period. Thus every plate is a rich composite work of art. Equally the multitude of engravings, on almost every page, give the features of carving and decorations which only need enlargement. There is almost nothing in existence worth figuring that goes back of the fifteenth century. One plate gives a buttressed coffer, Italian, of the fourteenth century. But after that period cassones, dressoirs, bedsteads, cupboards, armoires, tables, cabinets and chairs appear in successive profusion of styles. Mr. Foley's study of them is very minute and complete, while the specimens figured are of those less known, and taken by permission, often from the treasures of castles and private mansions. The volume is thus very different from the usual furniture book, which represents what one might expect to find in some old colonial home. It seeks the very choicest. At the same time it gives a very careful study of the elements and characteristics of the decorative arts as applied to household furniture. This sumptuous volume will appeal to the connoisseur more than to the amateur, and it belongs to the public library which can afford to buy the choicest works for the convenience of the less fortunate student. We add the remark that the author saves his maledictions for the iconoclastic Puritanism of the Commonwealth, which he charges with destroying precious specimens of ecclesiastical furniture.

**William H. Seward.** By Edward Everett Hale, Jr. Philadelphia: Jacobs & Co. $1.25.

**Stephen A. Douglas.** By Henry Parker Willis. Philadelphia: Jacobs & Co. $1.25.

Dr. Oberholtzer has added two new volumes to his series of "American Crisis Biographies": *Stephen A. Douglas*, by H. P. Willis, and *William H. Seward*, by Edward Everett Hale, Jr. In style, critical acumen and range of vision, the former is decidedly the superior of the two, altho it will by no means please any one living under the great

Douglas myth. Nowhere in the volume does Dr. Willis exhibit any warm enthusiasm for his subject; in fact, there is a sting about it that might have come from New England. He regards Douglas as a strictly practical politician from his earliest years, and declares that "he was always lacking in the idealistic instincts which lead such men to devote themselves to a cause for its own sake" (p. 86). To the very end our author views Douglas as a man bent largely upon pursuing his own "personal and political ends" (p. 334), which happened at times to make his conduct consistent and patriotic. In its plan, fullness of detail and fresh restatement of a well-worn theme, the book deserves a kind reception. For Mr. Hale's volume hardly as much can be said, altho it is an acceptable biography. He takes a generous view of the high purposes of Seward, but he does not unduly emphasize that statesman's place in American politics. The style of the volume is pedestrian, and there is scarcely a place where the reader will feel like running ahead to find out how the story ends. Both of these books, especially Hale's, will contribute to that vicious American tradition that over-emphasizes the place of the slave controversy in antebellum life, and causes a neglect of those great economic beginnings whose significance will be appreciated more in 1950 than in 1911. Nevertheless, these biographers are not responsible for the tradition; they are writing for a market and they have done their work well enough.

**Some Forerunners of Italian Opera.** By W. J. Henderson. New York: Henry Holt & Co. $1.25

This new little book from the versatile and trenchant musical critic of the New York *Sun* possesses a real value for the student of the history of music. The result of several years of painstaking research among original but forgotten sources of information, it corrects some old misapprehensions as to the origins of the opera—the most curious form of musical art, tho the most interesting probably to the largest number of people—which, Mr. Henderson shows, is "a child of the Roman Catholic Church." The book is a study of the lyric drama in Italy prior to the birth of opera, and its central theme the character and performance of the first Italian secular drama, the "Orfeo" of Poliziano, a lyric work made in honor of the Cardinal Francesco Gonzaga, probably in 1472, but which heretofore has been studied chiefly as a literary production, to the exclusion of its musical element.

## Literary Notes

....*Prayers in the Congregation and in College* (Longmans) contains prayers and fragments that were left among his manuscripts by the late James Martineau, and bear the stamp of his deep religious spirit.

....Those who are compelled to go thru sorrow or adversity will find help and strength in the sincere messages of Rev. G. H. Knight, entitled *In the Cloudy and Dark Day*. (Hodder & Stoughton; $1.25.)

....From the Pilgrim Press come three religious booklets breathing the freshness of the hills and the sea. *The Mountain Trail and Its Message*, by Albert W. Palmer, and *Outside a City Wall*, by William A Knight, are both illustrated, and Dr. Grenfell's Harvard address entitled *What Will You Do With Jesus Christ* contains a portrait of the gifted missionary (50 cents each).

....Readers of Mr. Noguchi's recent contribution to THE INDEPENDENT entitled "Modern Japanese Literature," will be interested in the announcement that the Bungli Lin-Kwai—a kind of Japanese Academy—has selected for translation the "Divine Comedy," "Faust," "Don Quixote," and the Râmâyana. The work of translation will be executed by specialists, who will take two or three years to complete it.

....There is nothing critical (as its author boasts) and nothing praiseworthy about Mr. J. Cuthbert Hadden's *Master Musicians: A Book for Players, Singers and Listeners* (McClurg; $1.75). In a sprightly vein he recounts many anecdotes of many master, and not a few minor, musicians, from Palestrina to Grieg—anecdotes as often as not purely mythical and oftener than not tinged in the telling with a foolish sentimentality. The book is intended avowedly for "the amateur and the young reader."

Frank Frankfort Moore in his *Life of Oliver Goldsmith* (Dutton, $3.50) waxed eloquent over his generous hero and chastises Boswell for propagating to the ends of the earth and of time a false conception of the Irishman and even a false idea of Dr. John

own opinion of him. There is a great deal taken for granted in Mr. Moore's "Life," which will never become authority, but which is interesting enough, in spite of a tendency toward long-windedness.

....It is difficult to deal patiently with a writer who assumes to speak "as a Hebraist" and declares that the post-Mosaic origin of the Pentateuch is utterly baseless, who regards the genesis narratives as coming "from the actors and witnesses of the events recorded," and who, as a translator, makes Abraham address Jehovah as "your excellency." Yet these traits are characteristic of the Rev. Dr. F. P. Ramsay's translation and notes on Genesis entitled *An Interpretation of Genesis* (The Neale Publishing Company; $2). It was hardly necessary for the author to advise his readers that "this translation is not designed to supersede the Authorized Version or the Revised Version."

....A luxurious cookery book with 48 exquisitely colored plates comes from London and the principal of the Gloucester Road School of Cookery, M. A. Fairclough. We note two excellent points in its arrangement. It gives the time required for the preparation of each dish, and it tells how to garnish food attractively so that it may appeal to the eye as well as to the taste, and the beautiful plates are most appetizing. There are 3,156 recipes in this Gargantuan volume which look feasible. The directions are clear; the number of persons to be served, the time required in preparing each viand, and its cost in England are points of value. (*The Ideal Cookery Book*. Dutton. $8.)

....In the poet's post-centenary year, Paris is trying to organize a movement to secure the house in the Boulevard St. Germain in which Alfred de Musset was born as a national museum. The birthplace is today a sadly dilapidated contrast to the stately house of a generation ago. "Improvements" have razed many of the streets of old Paris, and in this district only half a block has been left untouched—a link between old memories and present-day progress. The lower floors have been transformed into manufactories, while the upper stories with their soiled lace curtains, window ledges used as open refrigerators, and dangling linen floating in full view, proclaim the character of the tenants. All of which would have inspired the poet with a melancholy poem, had he lived long enough to celebrate his own centenary.

....Even a hidebound institution like the French Academy is, now and again, subject to suggestions of change, and M. Frédéric Loliée, in *l'Académie Française devant l'opinion* (Paris: Emile-Paul; 2 francs), gives the result of a plebiscite among men of letters as to reforming academic elections. M. Loliée's question is, Would the Academy lose prestige and authority if, instead of being a self-perpetuating body, it was elected by a restricted suffrage—that, say, of the authors who compose the Société des gens de lettres? The proposal receives a good many favorable votes—especially from writers who stand no chance of ever being chosen in the old way; but M. Camille Mauclair boldly declares that "the disappearance of this ridiculous preciosity would be much more conformable with the spirit of the times than any new mode of recruiting it." M. René Fauchois, author of the "Beethoven" presented a year ago at the New Theater in New York (his more recent spectacular play is entitled "Rivoli"—a Napoleonic piece) replies to the innovator: "The prestige of the Academy endures, as you recognize. All the world attests it . . . Then don't touch its method of renewal." Henry Bordeaux, who will one day be an Academician himself, speaks to much the same effect of an institution so "traditional, respectable, and respected."

....To the current *Forum* Mr. W. B. Yeats contributes an article on "J. M. Synge and the Ireland of His Time" that opens with an account of the storm which greeted the production of Synge's "Playboy of the Western World," in January, 1907. The poet was then lecturing in Aberdeen; from Dublin he received a telegram which said: "Play great success." "After one in the morning," he continues, "my host brought to my bedroom this second telegram, 'Audience broke up in disorder at the word shift.'" Indeed, from the moment that word was heard, the Irish Mrs. Grundy, personified in certain young men who thought the playwright was insulting their nationality, would not let a word of the piece be heard above their shouting and stamping and blowing of trumpets. But the Abbey Theater and its friends stood behind the unpopular play, and today it is the most acted and probably the most read of the little sheaf of dramas the playwright left behind him. *The Well of the Saints* is, however, the play which has been most recently reprinted; we have received it from the Dublin publisher, Maunsel, in an attractive foolscap octavo edition, in quarter parchment boards, issued at two shillings, sixpence. Uniform with *The Well* will be issued *The Playboy*, *Deirdre*, and, in a fourth volume, *The Tinker's Wedding*, *In the Shadow of the Glen*, and *Riders to the Sea*. The scene of *The Well of the Saints* is "some lonely mountainous district in the east of Ireland one or more centuries ago." Two blind beggars are the principal figures of the action; in their souls the dramatist finds just that opposition of nature-love and

beauty-love with sordidness and shrewdness which delighted his somewhat grim humor. There are passages of rare charm and poetry such as cry out for quotation; but we prefer to recommend the reader to go straight to the book itself, either in this Irish edition or in that issued at Boston by John W. Luce & Co. The reader will be interested in that page of Mr. Yeats's essay, cited above, which records:

"Synge seemed by nature unfitted to think a political thought, and with the exception of one sentence, spoken when I first met him in Paris, that implied some sort of nationalist conviction, I cannot remember that he spoke of politics or showed any interest in men in the mass. . . . He was wise in judging individual men, and as wise in dealing with them as the faint energies of ill health would permit, but of their political thoughts he long understoond nothing."

"When I got up this morning," Synge once wrote from one of the Aran Islands, Innismaan, "I found that the people had gone to mass and latched the kitchen door from the outside, so that I could not open it to give myself light." Mr. Yeats quotes this passage at length:

"I sat for nearly an hour beside the fire with a curious feeling that I should be quite alone in this little cottage. I am so used to sitting here with the people that I have never felt the room before as a place where any man might live and work by himself. After a while as I waited, with just light enough from the chimney to let me see the rafters and the grayness of the walls, I became indescribably mournful, for I felt that this little corner on the face of the world, and the people who live in it, have a peace and dignity from which we are shut forever."

This quiet life satisfied, writes his friend, "some necessity of his nature." Tho a good deal has been said, during the last few months, of this strange silent man of a genius which it is hard to appreciate without extravagance of expression, little of what has been written is instructive in respect to his personality. For he belonged to those "who, like Wordsworth, like Coleridge, like Keats, have little personality, so far as the casual eye can see, little personal will, but fiery and brooding imagination."

. . . . Not long ago we noticed the publication of a book by Bram Stoker entitled *Famous Impostors* (Sturgis & Walton). One of the most ingenious modern frauds is recalled by the offering by a London bookseller of an octavo volume published in 1852 by Moxon, entitled: *Letters of P. B. Shelley*, with an Introductory Essay by Robert Browning. The introduction is genuine enough, but not one of the twenty-five letters included is by Shelley. The forged letters were clever imitations of the poet's style and handwriting, even to the postmarks. The fraud was uncovered by Sir Francis Palgrave, who recognized a letter from Shelley to Godwin, his father-in-law, and the author of *Caleb Williams* as strangely familiar. He found it to be a plagiarism of an article which his father had contributed to the *Quarterly* twelve years before. Moxon, the publisher, had bought the forged letters at public auction. On discovering their true character, he suppressed the volume. The person responsible was found to be an individual who passed himself off as a natural son of Lord Byron, and had adopted his name. This adventurer discreetly dropped out of public view upon exposure.

## Pebbles

MUNCHAUSEN UP TO DATE.

"A man in China," B. M. said,
"A pigtail wears upon his head"—
"And pigs?" asks auditor pro tem.
"Wear nothing," says the genial M.

"Once," the Baron said, "methinks
I talked for hours with the Sphinx,"—
"She cannot talk," his hearers cry,—
"I know," says he, "but cannot I?"

"I know some tribes beyond the seas—
Their home's so hot it fricassees."
"How do they live?" the audience cries,—
"Away from home," B. M. replies.

Munchausen said: "The Japanese
Glue all the fruit upon the trees."
"Where does it grow?" the audience cries,—
"On other trees," B. M. replies.

"The Hottentot," Munchausen said,
"On pickled antelope is fed."
"Well?" the crowd, impatient, cries,—
"Indeed he's not," B. M. replies.

"The Congo hippopotamus
Would often mount an omnibus
If"—in doubt the people stir—
"He could," remarks the *raconteur*.

"I saw the Pole!"—the people stare—
"You didn't," one and all declare.
"I did," he said, "close by my ship."
(The Pole was on a Southern trip.)

"On Googlum's shore," the Baron cried,
"The people drink their whiskey fried."
"How can they?—tell us!" all insist—
"Because," says he, "they don't exist!"

—*Harvard Lampoon.*

"Come in," called the magazine editor.

"Sir, I have called to see about that article of mine that you bought two years ago. My name is Pensnink—Percival Perrhyn Pensnink. My composition was called 'The Behavior of Chipmunks in Thunderstorms,' and I should like to know how much longer I must watch and wait before I shall see it in print."

"I remember," the editor replied. "We are saving your little essay to use at the time of your death. When public attention is drawn to an author we like to have something of his on hand."—*Newark Evening News.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra, to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## The Peace Treaties with England and France

On the evening of March 22, 1910, at a banquet given in his honor by the American Peace and Arbitration League of New York, President Taft, in the course of his address, remarked:

"I have noticed exceptions in our arbitration treaties, as to reference of questions of honor, of national honor, to courts of arbitration. Personally, I don't see any more reason why matters of national honor should not be referred to a court of arbitration than matters of property or matters of national proprietorship.

"I know that it is going further than most men are willing to go, but, as among men, we have to submit differences even if they involve honor, now, if we obey the law, to the court, or let them go undecided. It is true that our courts can enforce the law, and as between nations there is no court with a sheriff or a marshal that can enforce the law. But I do not see why questions of honor may not be submitted to a tribunal supposed to be composed of men of honor who understand questions of national honor, to abide by their decision, as well as any other question of difference arising between nations."

Tho the President's speech was printed in full next morning, the significance of this opinion in regard to unlimited arbitration seemed to escape editorial vigilance. We are glad to believe that The Independent was the first journal to appreciate the President's utterance. We said in our issue of March 31:

"This is the first time, we believe, that any responsible head of a world power has taken such a progressive stand. Why should not President Taft, therefore, negotiate a model arbitration treaty with some friendly nation —say France or Brazil, in which *all* questions will be referred to arbitration. At present a few of the smaller nations have such treaties, but as yet none of the great ones. The treaties that Secretary Root has already negotiated with twenty-three of our sister nations are all modeled on the elusive Anglo-French treaty of a decade ago, in which 'honor, vital interests and the interests of third parties' are excluded from arbitration. As no nation has as yet attempted to define 'honor' and 'vital interests' they may be made to include everything or nothing. The United States, however, has more than once submitted questions to arbitration that have affected its honor, of which the Alabama case is the most notable. Thus President Taft's belief has already been put in practice by the United States. Let him therefore create a new kind of treaty that will as a model supersede the Anglo-French treaty. Where there's a will there's a way."

Mr. Andrew Carnegie was the first of the peace advocates to take action. No sooner had he read Mr. Taft's speech—he was in Colorado at the time—than he telegraphed the President his congratulations, and thru the New York Peace Society, of which he is president, he reprinted the President's remarks and circulated them broadcast.

Thus President Taft's progressive declaration was soon being discussed all over the world, and it was with great expectations that the friends of peace learned that the President was going to make another peace address at the banquet concluding the conference of the American Society for Judicial Settlement of International Disputes, held at Washington, December 17, 1910. Mr. Taft did not disappoint them. He said:

"If we can negotiate and put thru private agreements with some other nation to abide by the adjudication of International Arbitration Courts in every issue which cannot be settled by negotiations no matter what it involves, whether honor, territory or money, we shall have made a long step forward by demonstrating that it is possible for two nations at least, to establish between them the same system which thru the process of law, has existed between individuals under government."

This time every diner at the banquet rose and cheered. The press thruout the world next morning gave it prominence.

Almost immediately Earl Grey, the Secretary of State for Foreign Affairs of Great Britain, announced that the mother country would be proud to accept the offer of President Taft and enter into such an agreement with the United States.

Soon France followed suit. Then, to the surprise of all, hesitating Germany began to nibble at the bait. The enlightened opinion of mankind had in the meantime with one accord given universal praise to the leadership of President Taft. The peace societies were in a frenzy of activity. Mass meetings of endorsement were held in England and America and editorials of approval appeared in all parts of the world. Indeed, the only statesman of any prominence to raise his voice in opposition was ex-President Roosevelt. The movement was now irresistible, and Secretary Knox took up in earnest the drafting of the treaties.

Last week Thursday, a little after 3 p. m., in President Taft's study, two of these treaties were signed—those between England and the United States and France and the United States. The informality and simplicity of the ceremony added to its impressiveness. No speeches were made. Secretary Knox and Ambassador Bryce simply seated themselves on opposite sides of the table and affixed their signatures to the documents; that was all. Similarly the French Vice-Consul of New York and Secretary Knox signed the French treaty.

The treaties were sent to the Senate Friday and given to the public Saturday. They are substantially alike and in no respect differ from the résumé given out by the State Department on May 17 and commented upon editorially in our issue of May 25.

There are only three points this week that we wish to consider in the treaties. They are the most novel and important.

First. "All" disputes that are "justiciable" and cannot be settled by diplomacy are to be submitted to arbitration. Thus the scope of our existing arbitration agreements is expanded by eliminating the exceptions of questions of "honor" and "vital interests." Still the word "justiciable" offers a loophole to escape the recourse to arbitration because a nation may claim a dispute is not "justiciable." In that case a Commission of Inquiry will decide whether the dispute is "justiciable" or not. If it finds it is, the dispute must go to arbitration. If not there may be war. Thus it will be seen that the treaties do not absolutely provide ways to settle "all" differences by arbitration as President Taft said he was willing to do. Still it is almost inconceivable that a Commission of Inquiry would allow a difference to go to the point of war, especially as either nation could cause its findings to be delayed a year in order to let heated public opinion cool off and diplomacy to come into action. At any rate the scope of the treaties is so much broader than anything now existing between world powers that they constitute the greatest forward step ever made in the history of peace and arbitration.

Second. The device of the Commission of Inquiry is probably destined to play a more important role in these treaties than even their "all-inclusiveness." Here at last we have the international analogue of the "jury of presentment" or "grand jury" in private law. These commissions will be watched with intense interest by all students of comparative law.

Third. The "special agreement" in each case to arbitrate shall be made on the part of the United States by the President "by and with the consent of the Senate thereof." This means that the Senate will be in honor bound to refer all justicible disputes to arbitration, but that it will be consulted in framing the preliminary "special agreement" defining the dispute and the scope of the proposed arbitration. Of course the Senate under this somewhat elastic provision might so emasculate the agreement as to prevent its acceptance by the opposing Power, still such a contingency is so unlikely as to be a practical impossibility. Whether the Senate, however, will take the view that this whole clause signs away its constitutional prerogatives remains to be seen.

It is almost inconceivable, however, that the Senate will refuse to ratify these two great treaties. The President and Secretary Knox believe that all Senatorial prerogatives are fully conserved, and there are no better constitutional lawyers in the Upper House.

Still, now is the critical time. Any political or civic organization, any newspaper or individual that has influence with the Senate or with any Senator should exert it now.

If these treaties fail, the cause of universal peace will be set back a generation. Their importance cannot be overestimated.

Unlimited arbitration is the beginning of the end of war. As surely as daylight follows dawn, these treaties, once ratified, will be followed by similar treaties with other nations. Thus the time is likely soon to come when a few of the great nations, being bound to one another by indissoluble chains of peace, will negotiate a general treaty of unlimited arbitration among themselves. Thus will be formed the long desired League of Peace, and any genuine League of Peace is bound to grow until all the nations of the world enter its prosperous and concordant circle. First, unlimited arbitration treaties with England and France; second, a League of Peace; third, the Federation of the World.

In conclusion let us give to President Taft all honor for this great moral victory in world statesmanship. It should be a source of pride to all our people that the man who presides over a confederation of forty-six sovereign States —the greatest peace society known to history—should be also the leader of the forty-six sovereign civilized nations in their progress toward peace.

If peace hath her victories no less renowned than war, her greatest victory during the present century, if not during the human era, was all but achieved last Thursday. And when these treaties are finally ratified by our Senate—they are already ratified by the peoples of Britain, France and America—William Howard Taft will have done more than any other statesman of the world to hasten that day, sure to come, when, as Victor Hugo prophesied, "the only battlefield will be the market opening to commerce and the mind to new ideas."

## The Pending Tariff Bills

In addition to the bill for reciprocity with Canada, the Democratic House has passed by very large majorities and sent to the Senate three bills revising parts of the tariff. In the Senate, a majority composed of Democrats and insurgent Republicans has compelled the Finance Committee to report these bills for discussion. The Wool and Woolens bill was not accepted, but as a substitute for it the Senate passed a compromise measure, by a vote of 48 to 32. While the House bill cut down the duty on raw wool to 20 per cent., making proportionate reductions of the duties on manufactured goods, the Senate would have the duty on raw wool 35 per cent. The compromise bill, proposed by an insurgent, was passed by a coalition of insurgents and Democrats. Both bills are in conference, and the House Democrats are inclined to insist upon the low duties for which, with 27 Republicans, they voted.

The so-called Farmers' Free List bill, sent over from the House, has been accepted in the Senate by a vote of 48 to 30, but with amendments. Meats and flour and grain, free without restriction in the House bill, are made free by the Senate only when imported from countries which grant certain specified reciprocal concessions. This amendment permits free importation only from Canada, after ratification there of the reciprocity agreement. Last week, the Senate coalition of insurgents and Democrats ordered a prompt report concerning the Cotton Goods bill, recently passed in the House by a vote of 202 to 91, with 30 Republicans in the affirmative. This bill reduces the duties on manufactures of cotton by nearly one-half.

It can now be seen by everybody that a majority for a large reduction of the tariff exists in Congress—not only in the House, where control was shifted from one party to the other upon this issue, by last year's election, but also in the Republican Senate, where the Re-

SIGNING THE ANGLO-AMERICAN PEACE CONVENTION
Seated on the left, Mr. Bryce; on the right, Secretary Knox. President Taft is standing.

publican insurgents have made an alliance with the Democratic minority. Their motives are not wholly patriotic, and they are not ready to go as far in reductions as the House Democrats have gone or desire to go, but they are to be counted on that side of the question. This majority in Congress for a pronounced downward revision undoubtedly represents the views and desires of a considerable majority of the people of the United States.

There seems to be authority for the assertion that President Taft will veto any one of these pending bills that may be sent to him. Not because he opposes downward revision, for he has characterized the wool and woolen duties as "indefensible," and probably does not regard with favor parts of the cotton goods schedule that were badly revised in copy, but for the reason that in his judgment Congress should await the report of the Tariff Board, which will not be ready until December. A large sum has been appropriated for the work of this board, and revision based upon the reports of a non-partisan commission or board of experts has been suggested and approved by many persons, among them the Republican insurgents, who now are willing to ignore the results of the board's inquiries. Mr. Taft feels, we understand, that if he should attach his signature to any one of the pending bills, he would thereby give the board a blow which might be fatal, and would discredit a method of tariff revision the use of which would compel reform in tariff legislation.

It is also true, we presume, that he finds the bills objectionable, believing that the proposed reductions in the wool and cotton schedules are too severe, going far beyond the limits prescribed by his party's platform, which says that a duty should equal the difference between production cost here and production cost abroad, plus a reasonable profit for the domestic manufacturer. To the support of this doctrine he is committed, and he thinks, we suppose, that the Tariff Board's reports would enable Congress to make duties justly in accord with it.

But that doctrine of the Republican platform has lost, we think, much of the

respect and favor with which it was regarded, perhaps by a majority of the American people, not long ago. It has suffered in public estimation by reason of the Payne-Aldrich revision of 1909, a memorable political error, the full effect of which is yet to be seen.

The President probably thinks that the so-called Farmers' Free List bill is a crude and demagogical measure, made up of items picked out here and there, from one schedule and another, and constructed in accord with the erroneous doctrine that farmers must lose something when, by reciprocity or otherwise, the merely nominal and ineffective duties on their agricultural products are cut off. He would probably point with disapproval to the proposed repeal, in this bill, of duties on certain manufactured goods, while the duties on the raw materials used in making them are retained; also to the free-listing of certain manufactures because they are used by farmers, altho duties on similar manufactures not used by them are not touched. There is warrant for such criticism, but it must not be forgotten that there have been very large exports of a majority of the products to be free-listed, and even of those which rest, so to speak, upon a substructure of materials that are still to be protected. Such exports tend to prove that protective duties are no longer needed, unless the exporting manufacturers will say that they sell abroad at prices much lower than those which they exact here at home from the people who gave them protection. And if this is their practice, they deserve no sympathy when they lose their protective rates.

Mr. Taft is a just man. He willingly commended the Democrats for their decisive support of the Reciprocity bill. If one of these pending revision bills shall come to him, we believe that he will sign it if he is convinced that it is fair legislation for the public good. But if he thinks the reductions in it will not be warranted by the reports soon to be made by the Tariff Board, his duty will be to express his disapproval. The determination of tariff duties by the results of expert and impartial investigation is something greatly to be desired.

In this way the logrolling and political bargaining and maneuvering which have affected much of our tariff legislation, and signs of which can be seen in the pending bills, might be avoided. We regret that the fruits of the Tariff Board's labors have been so long withheld from Congress and the public, but we are not inclined to question the Board's earnestness or competency. It may be expected that the President will give all due support to an agency whose work, as he believes, must promote reform. If he decides to write veto messages, they will be forcible ones. But we fear his arguments, if he shall send any such messages to Congress, will have little weight with a considerable part of the American public. There is a popular demand for a sharp reduction of tariff rates, and the drift is away from the doctrines of protection. This is so because the Republican party so foolishly and even shamefully failed to improve its opportunity in 1909. It may be that both the party and its elected leader will be forced hereafter to pay a heavy penalty for that colossal blunder.

## Upton Sinclair and the Sunday Law

It is amusing enough to see Upton Sinclair and his nine associates in the Arden Single Tax Colony, charged by a "philosophical Anarchist" with breaking the Delaware Sunday law, convicted, and when they refused to pay the fine of $4 sent to the workhouse for eighteen hours and set to breaking stone; and yet it is not all amusing. There is a very serious question involved, that of the justice of the Sunday law and the wisdom of favoring or enforcing it.

In this case there is no puritanical rigor involved, and that supplies in good part the amusing element in it. This philosophical Anarchist is no religious zealot. He is a crank of another sort. He came to the Arden Colony, and there he talked too much. That sort love to talk. The Sinclairians got tired of him, found him a nuisance, and finally fired him by force and had him serve five days in prison for disturbing their peace. Because his liberty of prophesying was thus insulted he took his vengeance. He

had seen them playing baseball and tennis, on Sunday, which is against Delaware law, and he brought complaint and had the satisfaction of getting his revenge. Now Upton Sinclair will pass it along, for he threatens to invoke the law against members of the Wilmington County Club, who indulge in these same amusements on Sunday.

The old puritanical Sunday has gone never to return. It never was as ugly as it is represented, and it was approved by men who deserve our highest respect. It was based on a strict interpretation of Scripture now nearly passed away, and on a doctrine of Scriptural authority not now accepted so generally. The Mosaic command not to gather manna on the seventh day of the week would, with the old interpretation, forbid a man to pick an apple from his orchard or a melon from his garden on the first day of the week. But our Lord took a freer view of duty and allowed his disciples to help themselves to edibles in the field. We have now got quite beyond that license, and the European Sabbath is now very widely accepted. We are very far from the day when during the hours of Sunday service a rope was stretched across Broadway to prevent carriages from disturbing worship. The automobile and the trolley car run seven days in the week and at all hours.

The command to observe the Sabbath is based on the Fourth Commandment. In Exodus the reason given is because God rested on the seventh day from his creation of the world. That might make it appear of universal obligation. But in Deuteronomy, where the Ten Commandments are repeated, a different reason is given for the Fourth. It is there required because of the need of rest, "that thy man-servant and thy maid-servant may rest as well as thou." It was because they were slaves in Egypt, and Jehovah delivered them from this bondage; "therefore the Lord thy God commanded thee to keep the sabbath day," the word *sabbath* meaning *rest*; it was to be a memorial rest day after the seven-day toil of Egypt. But this reason for the day makes it national and not universal.

It was a question with the early Christian Church whether the observance of the Sabbath was part of the Jewish ritual which was abolished. Paul seemed to think so, but the reason of a rest day, and a day of worship, was so forceful that it was transferred from Saturday to Sunday and thus retained. It is not easy to prove, even under the strictest acceptance of plenary inspiration, that its obligation rests on the Commandments. It rests on the wisdom of it. In the New Testament there is not one rebuke of Sabbath breaking, and the only reference to the matter is in the way of liberty.

Mr. Sinclair does not break stone by any perversity of a religionist; it is an anti-religionist who required it. No religionist invokes the law where people amuse themselves on Sunday without disturbing others. But religious people and others not so religious insist on the day as a rest day from work. They want no Egyptian slavery in these days; and so the labor unions join the pulpits in support of reasonable Sunday laws. It is of no use to forbid Sunday afternoon trolley rides, or tennis or automobile parties. We may not like them, or we may think that Sunday can be better employed; but to devote it entirely to religious services or religious reading is impossible, and religion does not require it.

When Gen. O. O. Howard, whose widow has just followed her husband to the grave, sent his boy to be a member of the family of the distinguished and very religious Professor Christlieb, in Germany, his son was required, with the rest of the family, to attend worship on Sunday morning, but on Sunday afternoon the pious professor took all his household out for a pleasuring, to see the games or any other innocent entertainment. He was none the less religious for this license. On this matter the Apostle says: "Let every man be fully persuaded in his own mind," for religion does not require any observance, even of a Sabbath, except as we find it useful for its religious or ethical influence. We must have the Sabbath for the reason implied in its name, that of rest; and we also need the Sabbath for the cultivation of our religious nature, but how it is to be observed is to be left to the individual conscience under Paul's very wise direction just quoted.

Accordingly we would not have had

Upton Sinclair's decade of social reformers punished under the belated law of Delaware for playing tennis on their own grounds. Nevertheless, we take the liberty of smiling when the Anarchist imprisoned five days for talking overmuch sends ten of his persecutors to break stone for the sin of breaking the Sabbath.

## Our Timber Property

That the people own property in common, and that this stands as an investment, out of which they can make money, has until recently seemed very much of a myth, but at last we are getting to comprehend that land and water, and to some extent the air itself, may be real property, owned in common by the whole of us. Conservation as applied to the forest does not mean the mere holding back of a certain amount of timber land from private occupancy, the mere saving of the forests, but it means such a use of that timber land as shall create an income for the people of the United States. The Forest Service tells us that the real object of governmental oversight is to enable us to produce a constant timber supply quite beyond what we would if everything were left to Nature in the wild. By reasonable thrift and judicious oversight we can produce a timber supply always beyond our present need, clearing no tract of importance, but increasing its ability to yield lumber; and at the same time can conserve the power of our streams for irrigation, navigation, water supply and power.

The Service estimates that by careful management our forests will yield about four times what they are doing at present, and what they always have done when undisturbed. We can reduce the waste in the woods and the waste at the mill about one-third, with immediate profit as well as future profit. Preservative treatment will reduce the quantity of timber used about one-fifth. Then we can stop forest fires almost totally at a cost of one-fifth of the standing timber that is now burned each year. It is necessary to act at once, and then act certainly and vigorously in order to prevent timber scarcity. In other words, the United States holds property in its timber lands that it can make immensely profitable, without reducing its standing value one dollar, but slowly increasing it for at least a century to come.

Assuming that the State owns a tract of 100,000 acres, and supposing that it takes 100 years to grow timber to its greatest value, you may go farther and allow that the State can cut 1,000 acres each year, and so have gone over the whole 100,000 acres each 100 years. This allows one-hundredth of all our timber to be cut each year and turned to market; altho in reality there is a large quantity of immature lumber in trees not fully grown, and these will constitute a stand at any time during the 100 years ahead. The object is, every year to get a lumber supply from our public property, without reducing at all our opportunities for future cutting; on the contrary, there should be a steady increase in the possible output.

It is estimated that about 70 per cent. of our public forest holdings are now treated on scientific principles, and that from 3 to 5 per cent. of private holdings are also treated in a judicious manner. The object of legislation should be gradually to secure such a treatment of both private and public holdings as shall make the lumber supply of the United States secure and estimable. It is just at this point that the paramount right of the nation over private affairs has become an appeal to public sentiment. The Supreme Court of Maine tells us that, in order to promote the common welfare of the people of the State, by diminishing injurious freshets and droughts, by preserving natural water supply, by preventing injurious erosion of the land, and as an efficient means to this end the Legislature has power to regulate the cutting of trees by the owner thereof, and without compensation to the owner. This is the new doctrine that is beginning to be applied to all woodland.

One of our best authorities estimates that the average growth of the forest can be made 80 cubic feet per annum per acre, instead of 12; and if this were applied to the 135,000,000 acres of non-productive forest, the total increase in yield each year would be very close on to 25,000,000 cubic feet. Add to this 10 cubic feet of increased growth per acre

on 145,000,000 acres of better forest, and we get 15,000,000 cubic feet. This gives us a total annual increase of considerably over 25,000,000,000 cubic feet. In addition to this we would have the normal growth of the present conditions, which is 6,500,000,000 cubic feet. We have, however, to consider that the population of the country is increasing very rapidly, and that by the beginning of another century we shall need wood not for 100,000,000 of people, but for probably 300,000,000 or more.

The consumption of the forest is due to two causes; the first is natural consumption and the second is waste. The amount of wood used annually for lumber is estimated at 23,000,000 cubic feet. This will make 40,000,000 of board measure of lumber shingles and laths; 1,000,000,000 of posts and rails; about 120,000,000 railroad ties; 1,500,000,000 of staves; beside barrel hoops, fire wood, pulp wood, and a good deal besides distributed for minor uses. The waste of timber is more momentous, because it is useless, while it is enormous. It is strange to find that the largest waste is in our bungling methods of manufacture. It is believed that out of every 5,000 feet of timber logged in the forest, at least one-fifth is lost. After the logs get to the mill there is another waste, so that on the whole we do not get over one-half the lumber that we ought to get; others estimate at three-eighths really put to use. Turning to the use of standing timber, turpentining, or tapping it for turpentine, destroys the very best timber of whole States, in from five to seven years, utterly without excuse. This tapping is on the principle of "after me, the deluge." It is unnecessary and horribly wasteful.

Finally there is the loss of property by fire. Every year the recklessness of tourists or lumber cutters or railroads destroys as much timber as is put to use by the whole country. Nearly all our timber of first quality is more than one hundred years old, and a great deal of it is over a thousand years old. There is scarcely as much care taken to prevent the destruction of a one-thousand-year-old grove of redwood or sequoias as there is of preventing the destruction by fire of our orchards. What we wish to get at is that we are not handling our public investment as we would if we realized that it really was our property. Secretary Wilson, in his last report, tells us that we must learn to look on the forest as "a popular investment" of all the people, yielding us water, storage, forage and timber. In the water power alone we have 15,000,000 horse power, which we have hardly begun to harness. Most unsatisfactory is the fact that while forty years ago three-fourths of all standing timber belonged to us, the people, now only one-fifth. This came about by enormous grants, and by sales at nominal prices. A tract sold by the Government a few years ago for $250,000 has recently been sold for $2,250,000. The American people must get a clearer conception of their common ownership, and how to co-operate for the common advantage. To withdraw lands from sale does not mean to withdraw them from direct value to the people. The true meaning of "conservation" is to put our public property to public use. Our forefathers at Plymouth brought with them a clear understanding of the word "commonwealth"; we have to learn over again what it means and to put our knowledge into practice.

## Democratic "Incompetence"

Some writings require no comment. They speak for themselves, and with such eloquence that a gloss is resented by the intelligent reader. Such a passage occurs in a new book by that tireless critic M. Emile Faguet. Its title is "Le Culte de l'Incompétence." The paragraph in question deals with the French character. This book has been widely quoted in the French press of the two worlds.

"The French character does not measure up to the French mind, and there is the root of the whole evil. The French mind is of the highest order. As a creator of ideals, as a conqueror of knowledge, as a creator of beauty, no mind in the world has more value than the French mind—if as much, even. The French character is defective.

"We are light, we are without perseverance, without obstinacy, without tenacity. We are prompt at abandonment. We are children, we are old men, we are never—I speak of the majority—in the flower of maturity. Without being lazy, we love to lean back on those who make us work; it is the

[illegible] of our nature, we love to throw ourselves upon the State, even in accepting heavy tasks from the State. The base of this paternal inclination is the lack of personal will, and that lack of personal will itself derived from our horror of responsibility.

It is not so much that we do not want to act as it is that we do not hold to what is imputed to be the effects of action. No one or much or so likes to [illegible]

I wash my hands of it—it is not my fault. What would you have me do? I can't do anything, since I count for nothing.'

"We have been brought to this thru two centuries of brilliant despotism, of which we do not cease to be proud—not without cause, for that matter. We are used to not counting for anything, and used to counting upon everything's being done without any one's contributing to it. That is natural, because everything was formerly done by royalty without any individual initiative. Today, we fancy that everything is done by the collectivity without any one who goes to make up the collectivity having any share in the act. All have replaced one—and nothing is changed."

What is indispensable, according to M. Faguet, is that the democracy become "itself aristocratic" in the sense that it have in itself "will power and a taste for its exercise. The individual, who composes the democracy must have the sense of individual volition, individual perseverance, individual tenacity." After all these generalties, it is refreshing to close with an illustration. "I often repeat these words of a candidate in a comedy," says M. Faguet. "'Citizens, all that you will wish, I shall wish it even more than you.' The reply of the citizens ought to be: 'I have a wish, and that wish is that you should have a wish, and that you should know *what* you wish.'"

Of course all this can have no value for the American democrat—but it throws light upon the parliamentary régime of the sister republic.

**Our Japanese Guest**

Seldom has any foreigner received a more genuine and spontaneous welcome from the American people than Admiral Togo, who arrived on our shores last week from England, where he was Japan's special envoy to the coronation. It was a most happy thought of President Taft to make him the guest of the nation while here, and we are sure that all his countrymen will be gratified when they read the President's invitation to Japan, given last Saturday night at the White House banquet in the Admiral's honor. Said the President:

"Admiral Togo, I would indeed fail in my duty and be untrue to my own deepest convictions did I not take this occasion of the first public welcome to you as our national guest to express my own appreciation, and that of the American people, of the broad and humanitarian view taken by his Majesty the Emperor of Japan and the imperial Japanese Government in so readily and generously affirming, in the most positive and solemn manner, that no consideration of selfish interest should be permitted to obstruct the progress of the great world-movement for international peace, as exemplified in the general treaties of arbitration between the United States, Great Britain and France, signed on the day of your arrival in this country. I gladly acknowledge this important part which Japan has played in facilitating this noble achievement by its prompt and unreserved recognition, in the recent Anglo-Japanese agreement, of the great moral principle of arbitration, and I entertain the hope, with confidence, that the time may be not far distant when Japan will see fit to join in the movement now so auspiciously inaugurated."

It is such visits as this of Admiral Togo that furnish the most happy occasions for cementing international friendship, and we hope Japan will send us even more frequently than in the past her best men to enjoy our hospitality. Already an arrangement has just been concluded for a yearly exchange of Japanese and American scholars and men of affairs, which we have no doubt as time goes on will add much to the mutual acquaintance and good feeling between the two greatest nations on the Pacific. It is announced that Japan will send to us next autumn Dr. I. Nitobe, the author of "Bushido," and perhaps the best-known educator in Japan. He will spend a month each at Brown University, Columbia, Johns Hopkins, Virginia, Illinois and Minnesota, and the following year these six universities will jointly send a distinguished American lecturer in return to Japan. Despite all the foolish war talk, we are firmly convinced the relations of Japan and the United States were never better than they are at this moment.

**Women and Street Cars**

It is reported that the heads of the educational system of Chicago have decided to authorize the instruction of girls in the public schools of that city in the theory and practice of how to get on

and off street cars without unnecessary risk to life or limb. This is interesting. How far public instruction should be differentiated from the standards evolved by experience and generally accepted as the essentials of elementary education, is a question we do not care

TWO JAPANESE CONDUCTORS ON AN ERRAND OF PEACE

to discuss at the moment; but if a public school curriculum may properly be extended to include the practical things of life it is difficult to resist the conclusion that to teach girls how to enter and leave trolley cars would be very useful to them, and, incidentally, comforting to male citizens. That few women know how to do either is a fact attested by common observation. Mrs. Ella Young, the accomplished superintendent of Chicago schools, is doubtless an observing woman, and cannot fail to have found cause for wonder why it is that so few even of the athletic girls, who learn to do almost everything, seem able to master the trick of "flipping a trolley," as they call it in Chicago. It may be that prevailing styles of feminine dress have something to do with it; but fashions change too quickly to explain fixed habits. Doubtless there are psychological reasons not yet recognized why the typical woman cannot get on or off a car unless it has come to a full stop without imminent danger of damaging the asphalt with the back of her head, and why she can even then do either only with exasperating deliberation. Perhaps there is a deeper and more subtle reason for the phenomenon that in about ninety-nine cases in the hundred she assists her entrance with the left hand and her exit with the right. Why this persistence in a wrong method when the right method is not only much safer, but easier and more natural? In the old days of horse cars with rear platforms open on both sides, something akin to a mental process was needed to determine which hand to use. It depended upon which side of the platform happened to be the more convenient. As surface cars, open or closed, are now built accessible only from the right hand side, it should not be difficult to memorize and intuitively practice three simple rules: *Assist entrance with the right hand, assist exit with the left hand, and never step off of a car, whether moving or stationary, facing to the rear.* Since mothers, as a rule, do not seem qualified to instruct their daughters in these matters, not having themselves

learned there is reason to hope that by instructing the children we shall enable them by precept and example to instruct the mothers, and especially the grandmothers.

**To Be Represented by Vardaman**

Owing to some curious and widely prevailing mental aberrations, the people of Mississippi, who honored themselves by keeping John Sharp Williams so many years in the House and then sending him to the Senate, and who not long ago chose another worthy gentleman, Mr. Percy, to represent them there, have now rejected the latter and elected, to sit with Mr. Williams, James K. Vardaman, a coarse demagogue whose chief political stock in trade is abuse of those whom he calls "niggers." One of the placards exhibited during the recent campaign bore these words from *The Issue*, his personal organ:

"The way to control the nigger is to whip him when he does not obey without it, and another is never to pay him more wages than is actually necessary to buy food and clothing."

An admiring biographer has said that when "he entered the field of journalism in 1890, he soon went to the front as a graceful yet bold and incisive editorial writer." He is also something of an artist so far as pageants are concerned, for we read that he enlivened a campaign and emphasized his dislike of the "nigger" by going thru the streets clad in white and standing in a cart drawn by sixteen white oxen. A State is unfortunate when it is represented at Washington or elsewhere by such a man. We regret that Senator Percy in his quite reasonable disgust has decided to resign in January, more than a year before the expiration of his term. As the Legislature, it is said, would send Vardaman to fill the vacancy, Mr. Percy should stay. He should not open the Senate door for Vardaman until it is necessary to let him in.

**Dasheens**

A rival for the potato is heralded among the recent importations of the Government; mark well, we do not say a substitute. This new vegetable is related to the caladium, which is cultivated as "elephant ear." The tubers are similar to the potato in composition, but somewhat richer in starch and proteids. The flavor of the cooked tubers is slightly suggestive of boiled chestnuts. "Dasheens," as they are called, are baked or otherwise cooked like potatoes. The young leaves make an excellent substitute for spinach. In the more Northern States, where the frostless season is less than five months, the tubers must be started in hotbeds before setting out, but in the Middle and Southern States there will be no such necessity. In Florida it will do to plant the dasheen as early as the middle of February, if the conditions are not too dry. It takes about five months to mature the tubers, and then they are to be stored like potatoes. In sections where the frost does not penetrate the soil, the tubers can be left in the ground until needed for use. The dasheen is being tried in different parts of the country, and it is found to thrive in wetter lands than the potato. The plants require rich, moist soil, and they will not be injured by an occasional flooding during the growing season. In other words, the Government assures us that we have a new vegetable, full of starch and proteids, that is fit for culture over a very wide area, and that will give an enormous amount of food to the grower. If the report from our Department of Agriculture is not too optimistic, it is handing over to us something that will affect the food supply of the United States in a marked degree. The American people scarcely begin to recognize the vast amount of work being done along this line of adding to our food products, under the direction of Secretary Wilson.

**School Land**

For many years THE INDEPENDENT has advocated the planting of our rural schools in the middle of sufficient land to enable the pupils to carry on gardening, and with shops where they can otherwise cultivate their mechanical tastes. We are glad to note that some progress has been made in this direction during the last year. Among other steps taken, a little town in the State of Washington proposes to "purchase ten acres for the high school, and turn five acres

into an experimental farm, while the other five acres constitute a park and athletic field." Why not? If athletics are to be recognized at all, let them be recognized as a substantial part of education; but by all means let a State devoted to fruit growing and general agriculture train its boys and girls in such a way that when they are thru with the schools they shall be directly prepared to undertake those affairs which constitute what we call making a living. We are not opposed to culture as an end of education, but the highest culture attainable is closely associated with a knowledge of and sympathy with Nature. Read Emerson.

**Walking Tours**

One of the excellences of walking as an exercise and recreation is the fact that little or no machinery or equipment is required. Good legs, with stout boots at the ends—and there you are. To one who has very recently walked the southwest coast of that stern peninsula well named Nova Scotia, a rereading of Stevenson's essay on Walking Tours comes as a rare treat. This is not simply an excellent piece of style, but it is altogether sincere, and as true as it is sincere. "Landscape on a walking tour is quite accessory," one reads there.

> "He who is indeed of the brotherhood does not voyage in quest of the picturesque, but of certain jolly humours—of the hope and spirit with which the march begins at morning, and the peace and spiritual repletion of the evening's rest. He cannot tell whether he puts his knapsack on, or takes it off, with more delight."

Stevenson is, of course, writing of those who know enough not to walk against time. Other walkers are not, indeed, "of the brotherhood." They are not even walkers; "pedestrians," rather.

**On Speaking a Foreign Language**

In a contribution to the Paris *Temps*, entitled "Impressions of America," our contributor, the Baron d'Estournelles de Constant "hastens to correct those of his friends who attribute to him a too flattering familiarity with the English language. I speak English," writes the Baron, "almost currently, as I have spoken Greek and Italian, for the necessities of my propaganda; but without the least pretension, and by no means so well as many of my more modest friends." What is particularly interesting about this confession is what follows:

> "The truth is, incorrectitude is of little consequence provided that my language, and if worst comes to worst, my gestures, clearly express what I have to say. What is more, I long since found that to express simple ideas it is good not to have at one's disposition a too abundant vocabulary; it is good to repeat the same words when they are the right words; it is good, above all, not to give the impression of being an orator. What ought to be striking is the anatomy and not the clothing of one's thought; the more brilliant and sumptuous the clothing is, the more distrust it inspires, and the less durable the impression which it leaves."

This is a good thought; best of all is its application to the American traveler in foreign lands. Why is it that the American feels somehow ashamed when he tries to express himself in a language not his own? It is the false modesty of our fellow countrymen which prevents them from attaining success as linguists, just as it is often a still more false modesty which keeps them from speaking the best English of which they are capable.

**Ventilation**

Professor Winslow, of the Department of Biology, in the College of the City of New York, has been telling us the value of fresh air during dog days, and at all other times when we lack the capacity for easy work. Any one who is under obligation to do as much bright intellectual work during the heat wave as during the cool days of October will understand the argument. He insists that the question of efficiency in labor depends very largely upon having the right sort of conditions around us. For maximum efficiency the temperature should never pass over 70, and the humidity should not be above 70 per cent. of saturation. In other words, a human being is a creature of conditions, and his best work depends on finding those conditions. In the United States Pension Bureau, the removal of the offices from scattered and badly ventilated buildings into new and well ventilated, reduced the number of days of absence from 18,000 and over to about 10,000, or nearly one-half. The professor

relates a case of a printer who was compelled by the Board of Health to install a system of ventilation, and he found that his men, who were exhausted on busy days, were now without complaints and the sickness was greatly reduced. It seems to be well worth while, while rebuilding our cities, to thoroly consider this question of vitalization. Our offices should not keep us at an August level thru six months of the year.

Among the laws that went thru the New York Legislature is a most admirable statute, forbidding the placarding of the highways with advertisements. THE INDEPENDENT has long been contending against this abuse of privilege, and rejoices to see the end of it. The statute allows any one to destroy one of these signs, without appeal to any court or officer. Every citizen is an officer of the State to see that this law is enforced. To place an advertisement "on any stone, tree, fence, stump, pole, mile board, guide sign, guide post, bill board, building, or other structure, within the limits of a public highway" constitutes a misdemeanor, and "any advertisement in or upon a public highway in violation of this statute may be taken down, removed or destroyed by any one." The law will not be hard to enforce; all the easier if other States will follow the example.

One long-time trouble with the faint-hearted warriors for reform in Philadelphia has been the want of leadership and personality. Personality, at least, one of the reformers has in a high degree, and he is that veteran fighter, Rudolph Blankenburg. This sturdy German-American has now entered the mayoralty contest at the urging of the Keystone party organization of the Fortieth Ward, and his acceptance of the challenge is a guarantee that, whatever its issue, the battle will be peppery. Six years ago he was elected County Commissioner by the independents, with a majority of nearly 50,000. Perhaps Mr. Blankenburg will once more succeed in awakening his fellow townsmen—which in itself would be a greater achievement than being elected Mayor.

Within the last few years a habit which was once confined to the hopelessly vulgar—we refer to the chewing gum habit—has spread to an alarming extent. Today even the only rather-vulgar are victims of it. We advisedly say, victims. The face is beautiful indeed which does not repel one when it is seen convulsed with gum chewing. We do not pretend that the gum habit is a vice morally commensurate with wife-beating, or physically and mentally so dangerous as the use of opium. But it is unreasoned and unbeautiful. The spasmodic working of one's jaws is an unworthy manner of proving one's self a nervous Yankee.

It is only a few years since Great Britain built the first Dreadnaught, and now the nations of the world have a hundred in service or building or promised. That is the result of a bad attempt to surpass all one's neighbors. And each one that is laid down is bigger than what went before, and has bigger guns. There can be no end to the satanic rivalry but either bankruptcy or universal peace.

It is both cheerful and invigorating to hear such plain, strong English as was uttered by Augustine Birrell, Chief Secretary for Ireland, on the insult offered to Premier Asquith by the Unionists:

"The language hurled at the Premier's head in the House of Commons would have disgraced a gambling hell or a thieves' kitchen. It was a cold-blooded, as well as an organized orgy of stupidity and ruffianism."

The Bertillon system of identification is found applicable to animals, only instead of finger prints muzzle prints are used. Hereafter we may expect that ink and paper will take the place of the branding iron and that rustlers will be convicted by reference to a card index.

Aviation has scored its eighty-first victim, mostly victims of carelessness or needless daring. The cost is not too much for the benefit to come from the new power over the air. We have ceased counting the victims of the locomotive, or even of the automobile.

At the Wesleyan Methodist Conference recently held at Cardiff, Wales, women were for the first time admitted and fourteen synods were represented by women delegates. American Methodists, take notice.

# Insurance

## The Poor and Insurance

THE poor man always pays more for what he buys than the rich man because he is forced to buy in small quantities or on instalments. This rule has few exceptions, not one of which is insurance.

It is generally known that the companies that cater to the poor men charge more than those who cater to the rich. This is because the repeated collection of small amounts is costly and time-consuming. Probably all this is inevitable, tho it is said that the Massachusetts act empowering savings banks to go into workmen's insurance has caused the competing regular insurance companies to lower their rates.

Nevertheless, there is no excuse whatever for insurance companies so to take advantage of the helplessness and ignorance of their poor clients as to compel them to compromise or adjust claims so that thousands of dollars are withheld from victims of accidents or from their widows, children or dependents, and diverted to increasing dividends or surplus.

Yet this is just what the State Insurance Commissioners, recently sitting in New York, are said to have found out by investigating the books of some companies.

Fortunately the commissioners are at work on a system for the protection of the poor, which they hope to present at the National Insurance Commissioners' Convention to be held in Milwaukee the end of this month, with the idea that the proposed reforms, after careful discussion, shall be laid before the various State legislatures.

We hope that some practical way may be found to prevent by law or otherwise this most inhuman way of cheating the poor. But if the companies succeed in defeating any laws to that effect, we have no hesitation in warning them that sooner or later the movement—already in the air—for State insurance for the poor will become a practical issue in politics.

*

AMERICAN life insurance companies are disturbed by the reports that Italy is planning a State insurance monopoly. The proposed law provides that in future all insurance companies, Italian and foreign, shall cease to write new business in Italy, but may continue their work for the present policyholders only. There will be no compensation for contracts made in Italy or abroad, after the proposed bill becomes a law. Such contracts will be void and policyholders will be subject to a fine and imprisonment. The representatives of Italian and foreign companies have strongly opposed the bill, and the Ambassadors of the leading Powers have made a joint diplomatic protest. The capital of foreign companies in Italy amounts to $186,000,000, and $28,000,000 of this amount belongs to American companies.

*

THE Mutual Life Insurance Company of New York recently called attention to a policy in their company taken out in 1858 and held by a man ninety-six years old. A rival has now been discovered by the New York Life Insurance Company in Morris E. Fuller, of Schuyler, Neb., who took out a policy of $3,000 in that company in 1846. Altho this policy is twelve years older, Mr. Fuller is six years younger than the veteran policyholder of the Mutual Life. Both these men selected their companies wisely, for how many weaker life insurance companies have fallen by the wayside in this lengthy period.

*

A NOTED scholar once said there was nothing in the commercial world that even remotely approached the security of a well-established life insurance company. Certainly the security is vastly greater than in the case of fire insurance companies. There a conflagration can upset all calculations, and increase the yearly loss ratio from a usual 37 per cent to a ruinous 1013 per cent. as in the case of California after the San Francisco disaster. Even in hard times life insurance goes on as usual, and does not suffer from the increased loss known as "the moral hazard" in fire insurance.

# Financial

## Decline in the Stock Market

Sales of stocks on the New York Stock Exchange last week were 2,454,000 shares, against 1,714,000 in the week immediately preceding. A dull and narrow market for the first two days was followed by activity, much larger transactions and a considerable decline, notably on Friday, when the total (only 121,000 on Monday and 172,000 on Tuesday) rose to 747,000. Net losses of active securities for the week are shown below:

| | |
|---|---|
| Union Pacific | 8 |
| Northern Pacific | 6⅞ |
| Reading | 6⅝ |
| American Smelting | 6¼ |
| Great Northern | 5⅝ |
| United States Steel | 4¾ |
| Consolidated Gas | 4¾ |
| Lehigh Valley | 4⅜ |
| Missouri Pacific | 4½ |
| Southern Pacific | 4¼ |
| Atchison | 3¾ |
| Erie | 3⅝ |
| Amalgamated Copper | 3½ |
| Bethlehem Steel | 3½ |
| St. Paul | 3⅜ |
| Brooklyn Rapid Transit | 3¼ |
| New York Central | 1¼ |
| Pensylvania | 1⅛ |

As for a long time past, about three-fifths of the trading was in Steel, Reading and Union Pacific. The rate for loans on call was low, about 2½ per cent.

The decline was due to several causes. Early in the week the American Tobacco Company passed its customary large quarterly dividend, as a mark of "respect for the court," although it had been earned. It became known that both the Tobacco Company and the Standard Oil Company had found the task of dissolving in a manner satisfactory to the court a very difficult one. The stocks of these companies suffered losses in the curb market. Another highly favorable crop report depressed the price of cotton, and embarrassed speculators unloaded stocks to save themselves. Toward the end of the week it became known that the Interstate Commerce Commission was about to make an investigation concerning the freight rates for live stock and packing house products, and that the Government had brought suit, under the Anti Trust law, against six railroad companies and three other corporations engaged in the bituminous coal trade. All this caused liquidation and speculative sales for the fall.

## Cotton

The cotton crop grows with each successive official report. According to the report issued last week, the condition of the crop on July 25 was 89.1, against 88.2 one month earlier, 75.5 one year ago, 71.9 two years ago, and 79.4 as an average for ten years. Therefore the estimate of the quantity to be harvested has been increased to about 14,700,000 bales. It is quite probable that the largest of crops in the past will now be exceeded by 1,000,000 bales. For some time the price has been falling, and at the end of last week it was in the neighborhood of 11 cents a pound. Some think it will go down to 10 cents. The first bale of new Louisiana cotton was received in New Orleans on the 31st ult. Last year the first bale came to that market nine days later.

....A final computation shows that the average selling price of the $50,000,000 of Panama Canal bonds recently issued was 1.025764.

....The Wells-Fargo Express Company has bought control of the Pacific Express Company and will take over the express business on the Gould railroads.

....British investments of capital in the British Colonial possessions, according to the London *Economist*, amount to $6,825,551,427. Another financial journal estimates the British investments in Latin America at $3,730,000,000.

....We recently published railway statistics for the calendar year 1910, taken from *Poor's Manual*. The Interstate Commerce Commission has since made known its statistics for the fiscal year 1910. This report makes the number of miles of main track 240,438. At the close of the year the number of employees was 1,699,420.

The Independent

VOL. LXXI NEW YORK, THURSDAY, AUGUST 17, 1911 No. 3272

# Survey of the World

**At Washington**

The Senate and House conferrees on the Wool Revision bill agreed, August 11, upon a duty on raw wool of 29 per cent. *ad valorem*, as suggested by Senator La Follette. As compensation to the House the Senate conferrees agreed to accept the House classification on raw wools, which results in placing all wools at the same rate. Under the La Follette bill as it passed the Senate, two classifications were made, paying 35 per cent. and 10 per cent. duty respectively, *ad valorem*. Under the agreement the duty on all wools will be 29 per cent. After agreeing to this fundamental basis of operations the conferrees proceeded to the consideration of the duties on manufactured wools, which, it is assumed, will be compensatory throughout on a 29 per cent. basis. For the first time in recent history a tariff bill in disagreement between the two Houses was discussed by the conferrees in an open session. The conferrees have yet to reach an agreement on the Farmers' Free List bill. The troublesome matters now in the way of the adjournment are the statehood resolution and the cotton bill. President Taft will veto the former, because of the provision for the recall of judges. Undoubtedly he will veto the wool compromise as well. In line with the plans for an adjournment Thursday Senator La Follette proposed that an agreement be made by unanimous consent to vote on the cotton bill August 16. Senator Overman, of North Carolina, objected. ——The Senate has passed the reapportionment bill substantially as it came from the House. It authorizes a reapportionment by the States of Congressional districts on the basis of population as disclosed by the last census. It increases the membership of the House from 391, as at present, to 433, with two added when New Mexico and Arizona become States. Senator Root's amendment to keep the membership at 391 commanded only 23 votes. Then Senator McCumber offered to make the number 405, but he also failed.——The proposal of the House Interior Department Expenditures Committee to delay until fall further investigation of the Controller Bay affair in Alaska will be opposed by Republican members of the House. They claim that the committee is trying to drop the matter after allowing unwarranted reflections to be cast upon the Administration. Very little has been heard about the incident since President Taft sent his message to Congress.——A spirited attack was made in the Senate, August 10, on the National Monetary Commission, and ex-Senator Aldrich, its chairman, by Senator Cummins, of Iowa, aided by Senator Heyburn, of Idaho. Mr. Cummins started the debate by calling up his bill which demands a report from the Monetary Commission by December 4 next and its immediate disbandment thereafter. Senator Cummins, in his attack, charged extravagant expenditures by the commission and that clerks and members had received payment from the Treasury while they were already on the payroll in other capacities. This, he said, was illegal. Two members of Congress, he asserted, received an additional $15,562 each for service on the commission. Mr. Cummins made sarcastic references to the commission's European trip, which had cost $19,250. He stated that the total traveling expenses of the commission since March 31, 1910, were $35,412, which he estimated was enough to maintain one person for sixteen years on an

average expense account of $6 a day. ——The Lorimer investigation committee of the Senate has adjourned. Hearings will be resumed in Chicago early in October.——The Senate has voted to investigate the election of Isaac Stephenson, Senior Senator from Wisconsin. Mr. Stephenson is eighty-two, and the oldest member of the Senate. He is said to be worth $20,000,000. The investigation will be made by a sub-committee of the Committee on Privileges and Elections. The resolution calling for it was adopted unanimously, and follows a memorial from the Wisconsin Legislature. Sittings will be held, early in the fall, at Madison, Milwaukee, Duluth and Chicago. Senator Stephenson, by his sworn statement, admits spending over $100,000 in the primary election to secure the Republican nomination for the term beginning March 4, 1909. Senator La Follette's partisans are behind the demand for an investigation. The Wisconsin Senators were formerly political allies. Mr. Stephenson is said to have spent a great deal of money in the political contests of the Junior Senator from Wisconsin.——The death of William Pierce Frye makes the third vacancy in the Senate. The first, caused by the death of Senator Hughes, of Colorado, continues thru the failure of the Legislature to elect his successor. The second was caused by the failure of Hoke Smith to surrender the Governorship of Georgia before the expiration of the session of the Legislature that elected him to succeed the late Senator Clay. With Senator Frye there were fifty Republicans in the Senate. The Democrats had forty, besides the Georgia and Colorado seats, one of which will certainly be filled by a Democrat. Governor Plaisted, of Maine, will promptly appoint a Democrat to succeed Senator Frye. That will cut the Republican majority from nine to seven. The Maine Legislature does not meet until January, 1913, so that whoever is appointed will serve through the long session of Congress next winter and the remainder of this session. It will be the first time since the Republican party came into power that Maine has been represented by two Democratic Senators. Before the birth of the Republican party Maine was a Democratic State.

**Politics and Train Wrecks**

James R. Nugent, of New Jersey, has lost his post as Democratic State Chairman in consequence of calling Governor Wilson an ingrate and a liar. His place will not be filled immediately.——A newspaper has polled Democratic Senators and Representatives as to their preferences for the Presidential nomination of 1912, with the following results:

| | |
|---|---|
| Governor Wilson, of New Jersey | 45 |
| Governor Harmon, of Ohio | 25 |
| Speaker Champ Clark, of Missouri | 20 |
| House Leader Underwood, of Alabama | 17 |
| Governor Folk, of Missouri | 14 |
| Governor Marshall, of Indiana | 14 |
| Governor Foss, of Massachusetts | 2 |
| Positive first choice expression | 153 |
| House and Senate absentees | 51 |
| Declined to give preferences | 51 |
| Optional preferences | 7 |
| Noncommittal For Wilson (3), Clark (1) Harmon (1) | 5 |
| Total party membership | 267 |

Geographically, the poll indicates no sectional preferences, except, perhaps, in the case of Underwood, whose adherents are almost without exception from the South.——At Austin, Tex., has been organized the Woodrow Wilson State Democratic League of Texas.——The Pennsylvania Railroad's eighteen-hour flyer between New York and Chicago jumped a switch and crashed into a freight train near Fort Wayne, Ind., August 13. The express was running at 70 miles an hour, making up lost time. At least five persons were killed, including the engineers and firemen of both trains, and nearly forty persons were injured. The all-steel cars of the flyer resisted the shock of the collision, and only two of the nine cars were badly smashed.

**Canada and Reciprocity**

The political situation in Canada is uncommonly heated. Sir Wilfrid Laurier's opponents in the Province of Quebec are concentrating on the navy question, painting woeful pictures of the future of the Dominion thrust into the wars of Britain. The reciprocity issue is scarcely touched upon, and this is not strange, as Quebec stands to profit by reciprocity. Arrayed against the Premier is an odd trio of leaders of three

different factions—R. L. Borden, against both the reciprocity and naval policies of the Government; Henri Bourassa, the nationalist chief, who favors reciprocity, but opposes the navy; and Mr. Monk, who occupies middle ground. In British Columbia the Conservative (Opposition) party endeavor to divert attention from the reciprocity issue by raising the question of the Chinese exclusion act, and also that of the construction of naval vessels on this coast. The Liberal party has shown a tendency to have the Chinese head tax removed. The Conservatives are opposed to it. In Saskatchewan, the situation is uninteresting, for a strong Liberal vote is a foregone conclusion. In Ontario, the Liberals seem to lead their opponents. The agriculturists belonging to the Conservative party are breaking away from their leaders on the reciprocity issue and promise to vote for the Liberal candidates.

**The Political Situation in Mexico**

It was expected at the end of last week that the three prominent candidates for the Presidency of Mexico would be Francisco Madero, Gen. Bernardo Reyes and Dr. Francisco Gomez. The latter was Madero's revolutionary agent at Washington, and he has been on the generally accepted Madero ticket as candidate for the Vice-Presidency. He is in the Cabinet, from which his brother, Emilio, was recently dismissed by President De la Barra, with Madero's approval. This dismissal offended him, but he consented to remain on the Madero ticket. He criticised the Government for causing the arrest of about fifty of the Maderists who signed a menacing protest sent to the President. The latter said that the arrests had been ordered not by him, but by the courts. On the 11th there was a meeting, at the capital, of several hundred delegates from the Anti-Diaz clubs which nominated Madero a year and a half ago, before the revolution. This meeting demanded that Madero should now define his attitude toward certain policies. His reply was not satisfactory. These delegates are to hold a convention and it is expected that they will nominate Francisco Gomez. Madero has thus lost the central part of the organization which supported him before the revolution. He has asked Gomez to explain, saying that the latter cannot countenance this movement and remain on his ticket. At last week's State convention in Chihuahua, Madero was nominated, but with some difficulty, and it is predicted that the party there will be split at the election, a considerable number voting for Gomez. Orozco, one of Madero's Generals, who, with his friends, bolted the convention, may take this course. The Magonists rejoice, saying the split will enable them to raise an army. Against them the Government has sent 1,800 soldiers to Lower California, by ship from Manzanillo, and other troops are to go by rail from Douglas, Ariz., with the consent of our Government. Some think the acceptance of a nomination by Gomez will cause the election of Reyes, and, thereafter, a renewal of revolutionary activity. Cable messages from opponents of Madero have recently been sent to Diaz, in Switzerland, asking him to return. To these he gives no heed. Dispatches from Switzerland say that a message from the "Mexican Society of New York" informed Diaz that this society was getting up a huge petition for his return. There is a Mexico Society in New York, but it has taken no such action and has no knowledge of such a petition. The Mexican Government has borrowed $10,000,000 for two years at 4½ per cent. from Speyer & Co., of New York, who have easily sold the bonds at 98½.

**Hayti's Victorious Revolutionists**

Those Haytian revolutionists who are led by Gen. Cincinnatus Leconte entered the capital on the 6th and proclaimed him President. Leconte, exiled when Simon gained power, went to Jamaica and intrigued against him. In January last he started a revolution which came to nothing. Beginning again in May, he has been successful. He is forty-one years old, a mulatto and a lawyer. Gen. Antenor Firmin, his foremost rival, arrived in the harbor of the capital on the 8th, but was not permitted to land, altho he sent to Leconte a letter in which he said he was not a candidate for the Presidency and had retired from politics. Two days earlier, at Cape Haytien, he

was saying that he expected to be elected. General Fouchard, Minister to Germany, another aspirant, is on his way to Hayti. He has much support in the southern part of the republic, where the people fought under his leadership in the revolution of 1908. Leconte is ill, and many expect that there will be more fighting. Gen. Antoine Simon, Jr. (son of the deposed and fugitive President) arrived in New York on the 8th, in company with five other Haytian generals. He was carrying $60,000 in gold coin, which had been hastily packed in suit cases. The party was on its way to Paris. Young Simon asserted that the cause of the successful uprising had been popular disapproval, in the northern towns, of the railroad concession recently granted to Mr. Macdonald, of New York, and other Americans. It is said that Fouchard and Firmin will demand cancellation of this grant. Leconte is looking for a loan of $500,000. It is said that he agreed to pay from 100 to 500 per cent. for the money used in promoting the revolution.——Gen. Loynaz del Castillo, Cuba's Minister to Mexico, has resigned because the Gomez Government demanded a retraction of certain remarks about grafting, or official corruption, which were in a letter sent by him to a newspaper in Havana.——The fortifications for the defense of the Panama Canal will be constructed by the canal workmen, and Chief Engineer Goethals has been made a member of the Canal Defense Board. Six sites have been selected, four of them on islands near the Pacific terminus. It is expected that there will be twenty-four 12-inch mortars and twenty-four 14-inch or 16-inch disappearing guns. The entire cost will be about $12,000,000, and the appropriations already made will pay for the first year's work.——Guatemala's new Minister to the United States, Señor Mendez, says that the proposed loan of $30,000,000, which his country seeks, will soon be negotiated with American bankers.

**Disorder in Ecuador**

President Eloy Alfaro, of Ecuador, has been driven from office. At the end of last week he took refuge at the Chilian Legation in Quito. In January last, Emilio Estrada was elected President, the rival candidate having been General Flavio Alfaro. Immediately after the recent opening of the session of Congress, a member who had opposed Estrada moved that Congress should declare that he had not been lawfully chosen. A bitter debate followed, and in the course of it armed forces entered the chamber. A fight took place, and the two battalions representing Flavio Alfaro were defeated by the supporters of Estrada. On the 11th inst., at Quito, there was a battle between troops attempting to proclaim Flavio Alfaro President and other troops loyal to Estrada. President Eloy Alfaro resigned and sought a place of safety. Señor Freile, President of the Senate, assumed the duties of the Presidency and formed a provisional Government, with General Franco as Minister of War and Octavio Diaz in charge of the Finance, Interior and Foreign Departments.——Dispatches from Valparaiso say the idea is gaining ground there that Chili's third Dreadnought should be built in the United States.——Public meetings in Chili have protested against the expulsion from Santiago University's medical faculty of Dr. Max Westenhoeffer, professor of pathology, accused of slandering Chili in a German medical review.——The Venezuelan Government has signed an important concession providing a new water supply, a sewage system and street paving for Caracas. General Chalbaud, commander of the navy, has been sent to London to negotiate the sale of it to an English syndicate, also to sell a concession for a new bank and to negotiate for a transfer to English capitalists of the extraordinary concession recently granted to a Venezuelan company, which thereby acquired for fifty years exclusive rights of navigation in all of Venezuela's rivers and lakes, a salt monopoly, preference as to mining claims, and the exploitation and colonization of the entire Amazon territory.

**The Lords and the Veto**

The great constitutional struggle over the Veto Bill ended August 10, when the House of Lords, by a vote of 181 to 114, adopted Viscount Morley's motion not to insist upon the Lords' amendments. The purpose of the Government measure is to restrict the powers of the upper chamber over legislation

originating in the lower house. The Veto Bill practically limits the authority of the House of Lords to a two years' suspensory veto, and greatly increases the prerogatives of the House of Commons. The measure could not possibly have passed the House of Lords, except as it was known that its rejection would be followed immediately by the creation of sufficient new peers to enforce the will of the lower chamber, which, the Government asserts, was the will of the people. A feeling of relief is generally felt at the conclusion of the contest. The division of the Unionists over the question of acceptance of the lesser evil (Lord Lansdowne's policy) or of "fighting to the last ditch," regardless of the certain consequences (the brilliant suggestion of Lord Halsbury's group, including Lord Hugh Cecil, member for Oxford), has weakened the party. The Irish press adopts a moderate tone in discussing the passage of the Veto Bill and its significance for Ireland. The *Irish Times*, of Dublin, says that this is only the first step in a bitter and prolonged controversy. ——Mr. Balfour, in the House of Commons (August 7), moved a vote of censure on the Government for having secured the King's pledge to create, if necessary, enough peers to bring about the final passage of the act. The vote was refused by a division of 364 to 246. The censure was voted by a division of 282 to 68, in the House of Lords, before the measure so odious to the peers was reluctantly accepted by them. Lord Hugh Cecil, representing Oxford in the House of Commons, lived up to his reputation and declared that the Prime Minister ought to be subjected to the criminal law on the charge of high treason. ——A resolution to pay members of the House of Commons $2,000 annually for their services has been moved by Mr. Lloyd George, Chancellor of the Exchequer, in the House of Commons, and carried by a vote of 256 to 150. The Chancellor said that Great Britain was the only country in the world that did not pay members for their work in Parliament, which now-a-days was so exacting that the members had little time to attend to anything else. The bill was passed as a reward to the Labor party for its support of the Ministry. It will relieve that party of a great difficulty—for, apart from the burden of supporting Labor members out of party funds, the court judgment in the case of one Osborne, who, eighteen months ago, got a judgment against his own labor union, was that the paying of Parliament members out of union funds was illegal. ——A supplementary estimate of the Government moneys to be spent in 1911 contains several considerable items. The visit of the King and Queen to India for the Durbar is estimated at £120,000 ($600,000) and the payment of £400 a year to 630 members of Parliament makes another big item of £252,000, or $1,260,000.

**Strikes in England**

The general strike, which was postponed, but not averted, and which threatened to paralyze London with a food famine, was brought to an end on the night of August 11, when the Comptroller-General of the Commercial, Labor, and Statistical Departments of the Board of Trade settled the last outstanding dispute, that of the lightermen. It was expected that all work would be resumed on Monday of this week. Not only had the 40,000 men normally engaged in handling goods and food stuffs gone on strike with incidental rioting, but violence of a serious nature was looked for both in Liverpool and London. Before the settlement, cavalry and infantry had been dispatched from Aldershot to London. The food shortage was gravely felt at London and thousands of tons of fruit, vegetables and provisions have rotted on the wharfs and in the railway stations, both at London and in other ports. Coal and ice were scarce, and all industries suffered from the situation. Probably 125,000 men were idle for a part, at least, of the strike's term. ——At Liverpool, the situation on Sunday was worse than ever. More than 130 persons were injured in that day's fighting. The police force of 2,000 men, reinforced by the police of Birmingham and Leeds, could not cope with the disorder, and a magistrate read the riot act. Finally the Warwickshire Yeomanry came on the double quick and cleared the streets, which presented the appearance of a bloody battlefield. The strike leaders had been unable to control the mob of strikers and their hooligan sympathizers. Part of the gravity of

the situation lies in the fact that, tho the dockers have received a favorable award in their dispute with their employers, they have not been permitted to return to work until the grievances of the allied strikers, including unskilled laborers, are adjusted.——The English strike situation is complicated by the action of the railway employees. These, at Liverpool and Manchester, quit work August 5, demanding an advance in wages and shorter hours. At Manchester delegates of the railway men met, August 13, and drew up an ultimatum which informs their employers that, if the Liverpool and Manchester strike was not settled by 6 o'clock Monday evening, the transporters of the Lancashire and Yorkshire, Great Northern, Great Western, Great Central and Midland railways would cease work. ——The employees of the Glasgow municipal tramways went on strike, August 12, disorganizing the entire service. Strikers have, since then, wrecked the cars sent out, or prevented their circulation by throwing themselves across the tracks, disconnecting the trolley poles and stealing the starting levers. Monday night 700 railway men in Glasgow went on strike. The unrest is an outcome of the conciliation scheme devised by Lloyd-George and Richard Bell in 1907. The agreement was intended to prevent strikes until 1914, but the men are hopelessly dissatisfied with the working of the scheme and bitterly lament its slowness.——A strike of metal workers has broken out at Dresden, and the employers have locked out 60 per cent. of the union men. Twelve hundred metal workers are idle at Leipsic as a result of a strike and lockout in that city.——A general strike has been declared at Cadiz and most of the shops and factories have closed down.——The dockers of St. Petersburg have been on strike since the last of July, demanding changes in the manner of computing work, and a rise in wages.——Fire on the Queensland docks at Antwerp, where much cotton is stored, broke out August 11 and did damage amounting to $1,000,000.

**Portugal and Spain**

The inventory which the Portuguese Government is making of Church property under the separation act is attended with rioting and violence at various points.——Since the first of this month several clashes between republican troops and large crowds have occurred in the streets of Lisbon. The riot of August 4 was ended only after repeated cavalry charges and many arrests. It is stated that the cost of food (including olive oil, which is one of the necessaries of the poorer classes) has risen unaccountably under the new régime. Crowds marched to the parliament house protesting against the high prices.——The monarchical movement in Portugal has spread to two regiments of the regular army, and eighteen non-commissioned officers were recently placed under arrest. A sub-lieutenant of the Seventeenth Infantry at Beja, upon being denounced, escaped court-martial by committing suicide.——Revolution has broken out in Angola (Portuguese West Africa) and in Portuguese East Africa. European settlements have been attacked by the revolting natives.——It is reported that the Portuguese royalists are seeking a loan of $5,000,000 in Brazil, with which to purchase a warship, artillery and rifles. Documents found on a Jesuit priest arrested by agents of the republic indicate that army officers are in sympathy with the monarchist movement. ——A court-martial at Cadiz recently condemned twenty-six men who took part in the mutiny on board the Spanish battleship "Numancia" when the vessel lay in the roadstead at Tangier. The men were executed on the day of their condemnation. The official explanation was that the mutiny was a demonstration against the alleged hardships of service. Later the Spanish Government explained it as part of a republican plot in which about 100 sailors were implicated. Spanish warships have been dispersed in order to reduce the danger of other mutinies. The republicans are active thruout Spain, and demonstrations have taken place at Cadiz and Barcelona. Altho the Canalejas Ministry has done much to meet the democratic opinion of the country, the agitation against the Ministry and the monarchy increases. The censorship over the press and telegraphic communication is more severe than was in force under the Conservative Ministry. As we go to press, the outside world is receiving no news at all from the peninsula.

**The Cholera**

Paris is nervous, fearing a cholera epidemic. From Marseilles and from various ports in Brittany come reports of cases of cholerine. In the epidemic at the St. Pierre Asylum at Marseilles out of thirty-seven cases twenty were fatal. There are fifty cases at Quimper and a hundred at Brest. Two cases of cholera have been discovered in the South, in the department of Hérault, one each in the villages of Lunel and Saint-Bres. So far none have been reported from Paris, where the authorities are uncommonly active in disinfecting and street cleaning. Vital statistics in Paris for the week before last showed 1,159 deaths from all causes, against 925 for the week before. The normal average for the season is 800. The intense heat is doubtless responsible, in part, for the high death rate. The temperature still stands in the nineties, and ice costs $12 a ton.——It is recalled that Paris has been cholera stricken seven times since 1832. The decrease in the death rate in each succeeding epidemic shows that science has learned to combat the disease. In 1832 for each 10,000 inhabitants 234 died. There was a gradual decrease in the death rate until 1892, when it was only 3.6. Pilgrimages to Lourdes from suspected districts have been forbidden.——At Constantinople deaths from cholera continue to be reported in considerable numbers. Telegrams from Odessa report three cases of plague, including two on a Volunteer Fleet steamer which had been a month in the harbor. One of the steamer patients has died. At Nikolaiefsk, in the Province of Samara, there have been six fatal cases of cholera.——The Viennese authorities have prohibited the importation, exportation or transit of any second-hand clothing and old rags from Trieste, where there are twenty-six cases of cholera. Tourists who have arrived from Trieste are kept under the most strict observation.——The official report on the cholera situation shows that from July 27 to July 31, inclusive, there were throughout the kingdom of Italy a total of 802 cases and a total of 319 deaths.

*

**The Near East**

According to dispatches from Asterabad, the former Shah of Persia, Mohammed Ali, won his first fight against the Government forces. The battle is said to have been hard fought and occurred at Damghan, at the northern foot of the Elbruz Mountains. The ex-Shah is variously reported to be at Barfurush, 100 miles north of Teheran, and at a point about 200 miles northeast of the capital.——The Russian Government has issued a notice to Persia that it will hold the Persian Government responsible for any damages to Russian interests caused by the return of the ex-Shah. An analogous declaration was issued some time ago by Russia and Great Britain. The more recent communication takes the form of a semi-official note issued at St. Petersburg, and points out that since the downfall of Mohammed Ali the Persian Government has taken practically no steps looking toward the establishment of order.——The British Minister at Teheran has informed the Persian Government that the appointment of Major Stokes, formerly of the Indian army, as commander of the treasury guard, must not be persisted in if he is to be employed in Northern Persia (the Russian sphere of influence). Persia has replied that Major Stokes will not be employed in military operations. Mr. Shuster, the American Treasurer-General, states that without the organization of a treasury guard Persia will soon become bankrupt. Major Stokes was selected as commander, being the only man available familiar with the country and its language. ——A complete change in the internal and external policy of the Turkish Government is reported. It has been decided to effect a *rapprochement* of the Moslems in the various non-Turkish nations, whether they be Christian or otherwise. An agreement has been reached between the Government and the Greek, Bulgarian and Armenian patriarchs in accordance with demands put forward by the patriarchs of the three countries. In external politics the Government will repudiate any attempts of the Pan-Islamic propaganda to devote attention exclusively to political affairs or definitely ally itself with the triple *entente*. It is expected that the Cabinet will resign within a month's time. Probably Hakki Pasha, the Grand Vizier, will be replaced by Kutshuk Said Pasha, who will form an exclusively Young Turk Cabinet.

# The Peace Treaties

BY JOHN B. MOORE, LL.D.

[There is in America, and perhaps in all the world, no higher living authority on arbitration than Professor Moore, of Columbia University, formerly Assistant Secretary of State. Consequently the following article should be of profound interest to the Senate and the American people, now that the two great peace treaties are before the Senate for ratification.—EDITOR.]

THE framers of the peace pacts concluded with France and Great Britain on the third of the present month are to be congratulated on a notable achievement. Negotiated at the same time and being substantially identical in terms, these treaties, which now await the approval of the United States Senate, represent, altho they originated with the Government of the United States, the result of the combined and deliberate judgment of the three great Powers in whose names they were signed, and bear upon their face the marks of a wise and sagacious statesmanship. They may on the one hand cause a certain disappointment because they do not profess more, and they may on the other hand arouse a certain antagonism because they do not attempt less; but, to the great mass of thoughtful persons, whose minds are not prepossessed either by hope or by distrust, it is believed that an examination of their provisions will carry the conviction that they are judicious and practical measures, well adapted to the attainment of the resolve declared in their preamble, namely, that "no future difference shall be a cause of hostilities" between the contracting parties "or interrupt their good relations."

Let us consider, in the first place, the occasion and significance of the pending treaties. There exist at the present time between the contracting parties certain general treaties, concluded several years ago, by which it was agreed to refer to arbitration differences of a "legal nature, or relating to the interpretation of treaties," provided that they did not "affect" the "vital interests, the independence, or the honor" of the contracting Powers, or "concern the interests of third parties." It is not my desire to figure as a critic of the treaties of which this clause contains the substance. Altho they tended, in my opinion, to impair the force of The Hague convention, I recognize the fact that they were advocated and made by men whose abilities and motives command the highest respect, and that they were carried thru, not upon the supposition that they were of great intrinsic legal value or by any means to be regarded as final, but apparently upon the theory that the cause of arbitration would be advanced, especially among nations not supposed to be well inclined toward it, by the multiplication of arbitral agreements. Nevertheless, it is obvious that the comprehensive words in the clause above quoted are those of exclusion. The general who, on placing his troops in position, directed their thoughts to retreat by pointing out a way of escape, ought not to have been surprised when, as history tells us, they promptly took it. To the operation of all laws it is admitted that there are certain general exceptions, but it is not usual to devote the text of statutes to the enumeration of them. Even arbitral awards, no matter how absolute may be the terms of the submission, are, as publicists well know, open to attack on the ground of nullity if they violate certain fundamental principles of law or of procedure; but it is not the custom of nations to anticipate in their arbitral agreements the infraction of those principles. But, an even more serious objection to the words in question, is that they were far from measuring up to the standard of actual praetise. If, as between the United States and France, they constituted an anachronism, still more were they open to this objection as between the United States and Great Britain, who had on various occasions set the high example submitting to arbitral decision questions of grave import.

When may it not be said, even as to

a difference regarding a general question of international law, that it does not "concern the interests of third parties"? Does not every dispute involve a question of "honor," if one of the disputants sees fit so to regard it? The case of the "Creole" was supposed to involve a question of honor, and may be said to have done so in a very real sense; but, even sixty years ago, after nearly embroiling the United States and Great Britain in war, it was disposed of so quietly by arbitration (by the same mixed commission that passed upon and rejected claims on account of repudiated bonds of Florida and Texas) that the public scarcely learned what eventually became of it. When the arbitration of the Alabama claims was first proposed, Earl Russell rejected the proposal, on the ground that the controversy involved "the honor of Her Majesty's Government," of which that Government was, he declared, "the sole guardian"; and yet, nine years later, the very question in controversy was determined by the tribunal of arbitration that sat at Geneva. For many years the dispute as to the North Atlantic fisheries was (as the writer had some personal reason to know) discussed as a subject affecting the national honor, but within the past year the fundamental issues have been passed upon by the Permanent Court at The Hague — an achievement which would have been universally agreed to be impossible twenty years ago.

The existing treaties, therefore, have completely ceased to reflect in their terms the standard of what has been actually accomplished. Still less do they represent existing sentiment as to what should be done in the future. Ever since the principle was proclaimed, in The Hague convention of 1899, of "extending the empire of law and of strengthening the appreciation of international justice" by means of "the general and regular organization of the procedure of arbitration," there has been on foot an active and world-wide movement to provide the means for the regular, permanent and systematic application of the methods of mediation and arbitration to the peaceful settlement of international disputes. The countries of Central and South America as well as those of North America are now parties to The Hague convention, while the independent states of America have, thru the International American Conferences, made additional and comprehensive treaties of their own. Consequently, the pending treaties, while they represent the present standard of actual practice among the Powers concerned, respond to the demands of public sentiment among those Powers.

Let us next consider the subjects to which the pending treaties apply. While their object is, as declared in their preamble, to prevent hostilities between the contracting parties, they do not seek to accomplish that end by professing to submit all questions to the decision of an international tribunal, arbitral or otherwise. They provide for two methods of procedure, one of which is decisive, and the other essentially advisory. The first is carried out by means of arbitration; the second, by means of commissions of inquiry. The differences to which arbitration is to be applied are those "relating to international matters in which the high contracting parties are concerned by virtue of a claim of right made by one against the other under treaty or otherwise, and which are justifiable in their nature by reason of being susceptible of decision by the application of the principles of law or equity." It is questions such as these, and not questions of policy, such as the Monroe Doctrine, national expansion, and the development of military, naval, commercial or financial power, that the pending treaties include; and it is just such questions as the treaties include that the contracting parties, particularly the United States and Great Britain, have during the past hundred years disposed of by the score under special agreements of arbitration, but only after sharp controversies and numerous suggestions of war. They now propose permanently to establish the means of disposing of them, without the preliminary quarrels and menaces, the consequences of which never could be foreseen.

The proposed institution of commissions of inquiry, the principle of which is derived from The Hague convention, has a twofold object, (1) to obtain the preliminary investigation of questions which

it is expected to submit to arbitration, and (2) to obtain an investigation of any other controversy even if it is not agreed to fall within the scope of the stipulation for arbitration. To accomplish either one of these objects, the contracting parties agree to institute a "joint high commission of inquiry," to which each Government, unless they agree to constitute the commission in another manner, is to appoint three of its own citizens. It is expressly stipulated that the report of the commission shall not be regarded as decisive of the questions submitted to it, either as to the facts or as to the law, and is in no way to have the character of an arbitral award. To this rule there is only one exception, and this is of a limited and qualified character. If the contracting parties differ as to whether the controversy is a proper subject for arbitration, they are to submit this question to the joint high commission of inquiry; and if all the members of the commission but one report that the difference is within the scope of the arbitral stipulation, then it is to be referred to arbitration "in accordance with the provisions of the treaty." What, it may be asked, is the meaning of this phrase?

This brings us to the consideration of the full and ample manner in which the pending treaties provide for the participation of the Senate of the United States in their execution. It will be recalled that, in the case of the so-called Hay treaties of 1903, it was provided that in each particular case there should be concluded "a special agreement defining clearly the matter in dispute" and "the scope of the powers of the arbitrators." The Senate of the United States having substituted the word "treaty" for the word "agreement," so as to require in each case the advice and consent of that body, the treaties were for the time being abandoned. The pending treaties expressly stipulate that the special agreement, which must be made in every case of arbitration, shall be made on the part of the United States "by the President . . by and with the advice of the Senate," the British Government reciprocally reserving the right to obtain the concurrence of any of its self-governing dominions whose interests may be affected. The claims of the Senate are thus fully recognized, even where the joint high commission of inquiry may have held, by the vote of all or of all but one of its members, that a subject is proper for arbitration; for in no case can a question be arbitrated under the pending treaties without the concurrence of the Senate and its approval of the terms of reference.

Finally, it may be asked, what expectations may be formed as to the effect of the pending treaties? It is reasonable to assume that they will assure continued peace between the contracting parties. This will at any rate be their tendency. More than this cannot be predicated of any human contrivance. Neither the best considered constitutions nor the most firmly established judicial tribunals have effectually prevented the outbreak of civil strife. The American Civil War took place in spite of the Constitution and of the Supreme Court. This fact is not, however, an argument against the beneficence either of the Constitution or of the Supreme Court. It merely means that emergencies arise, that outbursts of feeling take place, which transcend and override all artificial barriers. In the abundant proofs which history affords of the existence of this human possibility, sufficient consolation may be found by those who may be apprehensive lest the use of force in the world may be too much restrained. Nevertheless, as it is now conceded on all hands that peace rather than war is the normal condition of civilized man, and that progress toward stable conditions of peace can be assured only thru the regulated administration of justice international as well as national, the pending treaties should be hailed as an evident and enlightened advance in that direction.

# The Stain on Our Flag

BY HENRY G. GRANGER

[The question of the claims of Colombia against the United States for its actions at the time of the secession of Panama comes up repeatedly, and will never be laid at rest until it is settled right. It seems to us that the Government of the United States has been mistaken in its policy of ignoring and neglecting the matter, thus laying itself open to the accusation of having something to conceal. In order to give the American people a clear understanding of the issues involved we have instructed Mr. Granger, who was formerly United States Consular Agent in Colombia, to go to Washington and make a careful study of the case. He has examined both sides of the controversy, and has obtained the opinions of a large number of prominent men on the question, some of which we print. THE INDEPENDENT long ago urged the settlement of Colombia's claims by negotiation or arbitration, and we shall doubtless present to the public some further considerations on the matter in the near future.—EDITOR.]

## I. The Facts of the Case

ON March 23, 1911, ex-President Roosevelt, in an address at the University of California, quoted in the New York *World*, *Tribune* and other leading papers, said:

"I am interested in the Panama Canal because I started it. If I had followed traditional, conservative methods I would have submitted a dignified state paper of probably two hundred pages to Congress, and the debate on it would have been going on yet; but I took the Canal Zone and let Congress debate, and while the debate goes on, the canal does also."

On March 28, the Colombian Minister to the United States, Señor Borda, called the attention of Secretary Knox to the above in a note from which we quote the following:

"As the fact whereof Mr. Roosevelt today boasts is the act committed by him in 1903, which at that time he described to Congress as 'the greatest triumph of diplomacy in the century' and against which Colombia protested as being an act of war at a time when the two nations were at peace, and a flagrant violation of the public good faith of the United States pledged in the treaty signed in 1846 and ratified in 1848, I deem myself forced to renew to your excellency, respectfully but firmly, that protest, in the name of the nation gratuitously, deeply and unexpectedly offended and injured."

On April 6, Congressman Henry T. Rainey, of Illinois, introduced the following resolution into the House:

"Whereas, A former President of the United States has declared that he 'took' Panama from the Republic of Colombia without consulting Congress; and

"Whereas, The Republic of Colombia has ever since petitioned this country to submit to The Hague Tribunal the legal and equitable question whether such taking was in accordance with or in violation of the treaty then existing between the two countries, and also whether such taking was in accordance with or in violation of the well-established principles of the law of nations; and

"Whereas, The Government of the United States professes its desire to submit all international controversies to arbitration and has conducted treaties with many other nations agreeing to submit all legal questions to arbitration, but has steadily refused arbitration to the Republic of Colombia: Therefore be it

"Resolved, That the Committee on Foreign Affairs of the House of Representatives be, and the same hereby is, directed to inquire into the same; send for books, papers, and documents, summon witnesses, take testimony and report the same, with its opinion and conclusions thereon, to this House with all convenient speed."

Ever since November 3, 1903—the date of the secession of Panama—Colombia has made strenuous efforts to have her claims settled. She very soon recognized, however, that the political status of Panama and the Canal work in progress there made the restitution of the lost State impossible. But she has ever claimed that the United States acted contrary to the first principles of international law and in direct violation of the treaty of 1846 in prematurely recognizing the independence of Panama, and asks that the case be referred to the Hague Court with power to fix damages. Up to the present moment, however, the United States has disavowed all responsibility in the matter, simply offering to mediate between her and Panama.

This request for arbitration on the part of Colombia seems a most reasonable one and I propose to devote the following article to showing why the United States should forthwith consent either to take the case to the Hague Court, or, adopt-

ing the more manly course of acknowledging error, make a voluntary payment of damages for the wrong done.

The treaty of 1846 between Colombia (then called New Granada) and the United States says (Article 35):

> The United States guarantee positively and efficaciously to New Granada, by the present stipulation, the perfect neutrality of the beforementioned Isthmus, with the view that the free transit from one to the other sea may not be interrupted or embarrassed in any future time while this treaty exists, and in consequence, the United States also guarantee in the same manner, the rights of sovereignty and property which New Granada has and possesses over said territory."

In 1869 another treaty was negotiated between Colombia and the United States under which the latter was to build a ship canal at the Isthmus of Panama. This treaty was signed by the Presidents of Colombia and of the United States and duly ratified by the Colombian Congress, but our Senate refused to ratify the treaty. That time, therefore, it was the United States that prevented the construction of the Canal.

On January 22, 1903, for the second time a treaty for building the Canal was signed at Washington between Colombia and the United States, known as the Hay-Herran treaty. After a hard campaign led by Senator Cullom against the forces favoring the Nicaragua route under Senator Morgan, the United States Senate ratified the treaty on March 17, 1903, but it was rejected on August 12 by the Colombia Congress.*

It is interesting to note that there is no evidence whatever to sustain the report circulated at the time that the Colombian Government attempted to "hold up" the United States Government for a larger sum than the $10,000,000 stipulated by the treaty. The United States undertook to give the $10,000,000 in order to get ample time for the completion of the Canal. Had the United States simply bought out the New French Canal Company, which was the successor of the bankrupt De Lesseps Company, without previous extension from Colombia, the concession would have lapsed long before the Canal could possibly be completed. The New French Canal Company had never had the capital or the force to finish the Canal, nor had it attempted to do more than make the barest show of work while maintaining a Micawber-like attitude toward the United States Government. That this was good policy and proved a lucky speculation was shown by the fact that they secured $40,000,000 from the United States for their property that had a short time before been reported offered for $6,000,000. The official records of the United States show that if Colombia had been allowed to deal with the French Company, as was her right by the Hay-Herran Treaty, quoted below, and to exact from it a sum which under the circumstances was within reason, the Hay-Herran Treaty would have been ratified in 1903 or at the following session and the United States have secured all it desired in a perfectly proper and legitimate manner.

The Hay-Herran Treaty recites under Article I:

> "But it is understood that Colombia reserves for herself all her rights to the special shares in the capital of the New Panama Canal Company . . . which shares shall be paid to her *at least for their nominal value;* but as Colombia holds this right only as shareholder in said company, this stipulation does not impose any obligation on nor is any assumed by the United States."

Yet one week after the signing of this treaty, the Paris managers of the syndicate had declared Colombia's 50,000 shares "non-negotiable," which was nothing more nor less than a repudiation of Colombia's interests in the company as recognized under the Hay-Herran Treaty. So Colombia received nothing for her interest in the French Canal Company, for the $40,000,000 went to the French syndicate and the $10,000,000 offered in the Hay-Herran Treaty went eventually to Panama.

The two most active representatives of the French syndicate during all these negotiations were Mr. William Nelson Cromwell, a New York lawyer, and M. Philippe Buneau-Varilla, of Paris. These two gentlemen at first worked diligently with Herran to defeat the Nicaragua route, but as soon as this was accomplished they devoted their efforts to keeping Colombia out of any part of

*The full story can be found in the United States Document No. 51, of the Second Session of the Fifty-eighth Congress and the Libro Azul (Blue Book), published in Bogota in 1904 by the Ministry of Foreign Relations.

the $40,000,000 given by the United States to the French syndicate.

Let us see how Mr. Hay, in a cable to our Minister to Bogota, was made to put the screws on Colombia:

"If Colombia should now reject the treaty or unduly delay its ratification, the friendly understanding between the two countries would be so seriously compromised that action might be taken by the Congress next winter which every friend of Colombia would regret. Confidential. Communicate substance of this verbally to the minister of foreign affairs. If he desires it, give him a copy in form of memorandum."

The nervousness that this cable naturally aroused might have been allayed by the reading of Article 35 of the treaty of '46 wherein we guaranteed Colombia's sovereignty over the Isthmus, but it can be assumed that the correspondence did not make for cordiality, nor facilitate the efforts of such friends of the United States as Reyes and Ospina who, being leaders in industrial development and appreciating the benefits that would result from the opening of the Canal, bent every effort in favor of ratification.

This treaty, as we have said, was rejected by the Colombian Congress, as might reasonably have been anticipated. Mr. Beaupré then wired Mr. Hay that a special envoy would be sent to Washington to renew Canal negotiations. He had already shown that the following Congress would be so constituted as to ratify the Hay-Herran Treaty. To this Mr. Hay replied on August 22:

"Referring to your telegram 17th, if you find disposition on the part of Colombia to ask terms more favorable to Colombia than those heretofore negotiated, you may intimate orally, but not in writing, that it will be useless to send a special envoy."

This showed that the Administration was firm for the cause that would protect Mr. Cromwell and his associates in the enjoyment of their full $40,000,000.

The knowledge that a body of Colombian troops was on the way to the Isthmus on the cruiser "Cartagena" brought quick action. *On November 2, the day before the secession*, Acting Secretary of the Navy Darling wired as follows, to the Commander of the "Nashville" in care of the American Consul at Colon:

"Maintain free and uninterrupted transit. If interruption threatened by armed force occupy the line of railroad. Prevent landing of any armed force with hostile intent, either Government or insurgent, either at Colon, Porto Bello, or other point. Send copy of instructions to the senior officer present at Panama upon arrival of "Boston." Have sent copy of instructions and have telegraphed "Dixie" to proceed with all possible dispatch from Kingston to Colon. Government force reported approaching the Isthmus in vessels. Prevent their landing if in your judgment this would precipitate a conflict. Acknowledgment is required."

The same order was sent to the Commander of the "Dixie" at Kingston, and a similar one to the "Marblehead" at Acapulco. The "Maine," "Boston," "Atlantic," "Concord" and "Wyoming" were also ordered to hurry to the Isthmus.

The following messages from Commander Hubbard, of the "Nashville," who was another and indeed the principal factor in the successful issue of the coup, tell their own story:

COLON, *November 3, 1903.*

SECNAV, Washington, D. C.:

Receipt of your telegram of November 2 is acknowledged. Prior to receipt this morning about 400 men were landed here by the Government of Colombia from Cartagena. No revolution has been declared on the Isthmus and no disturbances. Railway company have declined to transport these troops except by request of the governor of Panama. Request has not been made. It is possible that movement may be made tonight at Panama to declare independence, in which event I will . . . (message mutilated here) here. Situation is most critical if revolutionary leaders act. HUBBARD.

---

COLON, *November 4, 1903.*

SECNAV, Washington:

Provisional government was established at Panama Tuesday evening; no organized opposition. Governor of Panama, General Tobar, General Amaya, Colonel Morales, and three others of the Colombian Government troops who arrived Tuesday morning taken prisoner at Panama. I have prohibited transit of troops now here across the Isthmus.

HUBBARD

What is to be thought of the above quoted statement that there was "no organized opposition," the same message announcing that the American Commander who signed the message had "prohibited transit of troops" whose transit across the Isthmus would have been preceded by the "taking to the woods" of all concerned.

There was no intention of letting Colombia retake the Isthmus, as a sam-

ple telegram of Secretary Moody's shows:

[illegible], Boston

Upon the arrival of the 'Marblehead' sufficient force must be sent to watch movements closely of the British steamers seized at Buenaventura and to prevent the landing of men with hostile intent within limits of the state of Panama. Protect the British steamers if necessary.

So much for the military aspects of the movement, in which the total death roll was one Chinaman killed by one of the three shots fired from the "Bogota" the night of the "secession." How Commander Hubbard overawed the Colombian troops at Colon with the Stars and Stripes and American marines, and how our officers prevented all attempts of Colombia to recover the Isthmus, are matters of record.

The day following the "secession" some hours before even the municipality of the city of Panama, the stronghold of Chinese, foreign merchants and Jamaica negroes, had ratified the act, the executive committee of the insurrectionary movement, consisting of Messrs. Arango, Boyd and Arias, sent the following cable:

SECRETARY OF STATE, Washington:

We take the liberty of bringing to the knowledge of your Government that on yesterday afternoon, in consequence of a popular and spontaneous movement of the people of this city, the independence of the Isthmus was proclaimed and, the Republic of Panama being instituted, its provisional government organizes an (executive) board consisting of ourselves, who are assured of the military strength necessary to carry out our determination.

The day following, November 5, they cabled Mr. Hay announcing the appointment of M. Bunau-Varilla as confidential agent at Washington. The next day he was appointed in a cable to Mr. Hay as Minister Plenipotentiary and Envoy Extraordinary from the Republic of Panama (!) "with full powers to conduct diplomatic and financial negotiations."

On Friday, November 13, Bunau-Varilla was officially received by the President, in the escort of Acting Secretary of State Loomis. This was the earliest date at which his letters could arrive by steamer from the Isthmus.

Five days later the Canal Treaty was signed, whereby Colombia's emoluments of $10,000,000 went to the Panamanians and the $40,000,000 was delivered thru J. P. Morgan & Co. to Cromwell, Bunau-Varilla, Harriman and their associate holders of French Company shares—this long before Panama had anything resembling a constitution, before she had held an election, or had in any way proved her right to membership in the sisterhood of nations.

In view of the official telegrams quoted it is not necessary to say either when, or in presence of whom, or what United States naval officer at the Isthmus during the "secession" told me that "the Panamanians were a set of sheep; our boys had to do it all."

Now I will take up the arguments and finally the possible methods of settlement and some weighty opinions concerning them.

## II. The Arguments

As to the achievement of the independence of Panama, let us bear in mind that the only arms raised in her cause were the rifles of a handful of disloyal Colombian troops under the command of the traitor Esteban Huertas, frankly purchased for $35,000 silver by the Panama Junta. These traitors would not have lasted more than a few minutes against the 450 Colombian troops that landed in Colon under General Tovar on the morning of November 3, the very day of the so-called secession. But these were prevented from going to Panama by the marines and gunboats of the United States. Much less could the Huertas forces have resisted the thousands of troops that, under General Reyes, Ospina and Holquin, were prevented from landing on Panama soil by American forces.

Never was anything written in the annals of nations more remarkable than the instant recognition of a government not yet formed, in a country but a small fraction of whose inhabitants had heard of its secession, where not a shot was fired in its defense, where the only reliance was on the purchased traitors of the mother country and on the force of the great nation that was in honor bound by treaty to maintain its integrity. And all this was supplemented by the reception as Panama's Minister Plenipotentiary of a non-resident alien whose only interest

was the valorization of the shares of a speculative company.

After the secession General Reyes was appointed by Colombia Special Commissioner to the United States to present his claims to our Government. In his note to Mr. Hay of December 23, 1903, he quotes from a note of instruction from Secretary Seward to Mr. Adams during our Civil War as follows:

"A nation that recognizes a revolutionary State, with a view to aid its effecting its sovereignty and independence, commits a great wrong against the nation whose integrity is thus invaded, and makes itself responsible for a just and ample redress.'

And General Reyes adds:

"It would seem that nothing could be added to the benevolence of those noble and humanitarian doctrines, written by the great man, who, unhappily for his country and for Colombia, is not living today."

The first article of the treaty of 1846 says:

"There shall be a perfect, firm and inviolable peace and sincere friendship between the United States of America and the Republic of New Granada [Colombia] in all the extent of their possessions and territories and between their citizens, respectively, without distinction of persons or places."

General Reyes comments on this as follows:

"If the United States repels by force the action of our armies in Panama, is not this a clear violation of this article, since peace in one of the Colombian territorial possessions is broken?"

It would be very illuminating to make many quotations from the voluminous diplomatic correspondence resulting from the Panama secession, and, tho lack of space forbids, attention must be called to a few of the dispatches.

On June 10, 1903, while the Hay-Herran Treaty was before the Colombian Congress, Minister Beaupré cabled Mr. Hay:

"Sir—The local agent of the Panama Canal Company has informed me that he had received an official note from the Colombian Government, stating that it did not think that the convention would be ratified, because of the opinion that the compensation was insufficient, but that if the canal company would pay to Colombia about $10,000,000 ratification could be secured."

Mr. Hay replied:

"Instructions heretofore sent to you show the great danger of amending the treaty. This Government has no right or competence to covenant with Colombia to impose new financial obligation upon canal company and the President would not submit to our Senate any amendment in that sense, but would treat it as voiding the negotiation and bringing about a failure to conclude a satisfactory treaty with Colombia."

A previous dispatch was as follows:

WASHINGTON, *April 7, 1903.*

AMERICAN MINISTER, Bogotá:

Referring requests Colombia to canal and railroad companies for appointment agents negotiate cancellation present concessions, etc. If subject arises, inform Colombian Government that treaty covers entire matter and any change would be in violation of Spooner law and not permissible. HAY.

Some have thought that the foregoing indicate a desire also to safeguard certain powerful private interests.

With the enormous profits of the Suez Canal before their eyes; with the knowledge that for over a generation the Panama Railroad had been the most profitable road on earth, for its mileage; with a plan drawn up under which holders of shares in the French Company would reap an enormous profit, while the Colombian Government would be practically little better off than with her railroad revenue, it is no wonder that public opinion in Colombia was hostile to the ratification of the treaty.

Unquestionably it was provoking to the Roosevelt administration not to have the treaty promptly ratified, just as was our Senate's inaction in 1869 a grievance to the Colombians when they had signed with us a Canal treaty which was duly ratified by their Congress but refused by us. Great annoyance was shown by Mr. Hay during the negotiations at President Marroquin's attempt to exact a settlement from the French Company. But altho Colombia ceased these attempts on Mr. Hay's protest, the fact that Colombia was the second largest shareholder in the French Company would seem to have given her more than a shadow of reason for her demand.

The opposition on the part of Colombia to the ratification of the treaty was chiefly due to two causes:

First. The belief in the impracticability of the Nicaragua route as an alternate.

Second. The fact that by simply sitting tight a reasonably short time the entire property for which the United States was ready to give $10,000,000 would go

to Colombia by lapse of contract. Colombia, on the supposition that she was not to be a victim of international highway robbery, certainly had the whip hand, and in the following session of Congress could readily have forced the French Company to hand her another $10,000,000, or lose all by lapse of time.

On the other hand, the treaty of 1846, which was Colombia's guarantee, and whose violation on the part of the United States is the basis of the controversy, provided a solution of the question if Mr. Roosevelt had chosen to apply it. Section III of Article 35 says:

"the said treaty shall continue binding on both parties, beyond the twenty years, until twelve months from the time that one of the parties notifies its intention of proceeding to a reform."

A simple notification of Mr. Hay after the ratification seemed doubtful would have brought the Colombian Congress to a realizing sense of danger and secured the immediate ratification of the treaty. But this notice was not given, and on its own records the United States stands convicted of bad faith, and all the sophistry of those implicated will not relieve her of her duty to give satisfaction to dismembered Colombia.

Under date of October 21, 1905, the Colombian Minister at Washington, Señor Mendoza, presented a thoro recapitulation of events, and urged arbitration of the differences between the two countries. In a subsequent note on April 6, 1906, to which our State Department has never made any reply, Minister Mendoza says:

"I note the fact that in your communication [Secretary Root's] it is stated for the first time, on behalf of your Government, that the United States espoused the cause of Panama, the language being:

"'Nor are we willing to permit any arbitrator to determine the political policy of the United States in following its sense of right and justice by espousing the cause of this weak people against the stronger Government of Colombia, which had so long held them in unlawful subjection?'

"I must say that the question between Colombia and the United States is not whether Panama was justly entitled to assert independence, but whether the United States was under obligation, by treaty or by principles of international law, not to do the things which it is admitted were done by the United States after the declaration of Panama's independence was made.

If the acts of the United States were lawful and right, this loss must fall upon Colombia. If, on the other hand, this loss was wrongfully occasioned by acts of the United States done in violation of the provisions of the treaty by which the United States has obligated itself, or in violation of principles of international law to which the United States has assented, then the United States is lawfully bound to compensate Colombia for the damage thus done to her.

"In order to facilitate a decision by the Government of the United States, in case it cannot yet see that it is lawfully bound to compensate Colombia, I propose on behalf of Colombia that the United States and Colombia forthwith enter into a convention for the purpose of securing an impartial judgment upon the following strictly legal questions:

"1. Did the treaty of 1846 obligate the United States to maintain the sovereignty of Colombia over the Isthmus of Panama against menace or attack from any foreign power and against internal disturbances that might jeopardize said sovereignty?

"2. Did the treaty of 1846 obligate the United States to refrain from taking steps which would hinder Colombia in maintaining her sovereignty over Panama by suppressing rebellion, revolution, secession, or internal disorder?

"3. Did the treaty of 1846 grant to the United States the right to take those steps which it is admitted were taken by the United States to prevent the landing of troops in Panama and the suppression of the rebellion?

"4. Did the treaty of 1846 leave the United States free lawfully to take the steps which it is admitted by the United States were taken as regards Panama?

"5. Did these acts of the United States, which it is admitted were taken, prevent Colombia from taking the steps necessary to suppress the rebellion and maintain her sovereignty over the Isthmus?

"6. Were the admitted acts of the United States in respect to Panama in violation of principles of international law which have been recognized by the United States as binding upon nations in their dealings with each other?

"7. What damage, if any, has been occasioned to Colombia by acts of the United States which are admitted by the United States, and which may be adjudged as having been in violation of obligations imposed upon the United States by the treaty of 1846 or by principles of international law to which the United States has assented?"

The foregoing diplomatically astute communication, from which we have quoted only a few extracts, as well as Minister Borda's recent protest based on the published reports of Mr. Roosevelt's Berkeley speech ("I took the Isthmus") make it apparent that it is up to the United States to come to terms. What these should or might be will next be

taken up, with some weighty opinions on the subject.

## III. Our Duty

In response to Colombia's claim for indemnity for the loss of Panama there are three courses open to the United States.

First. Let things stand as they are, continuing to ignore Colombia's claim and arguments.

Second. Refer the dispute to arbitration, which would naturally mean the Hague Court.

Third. Settle direct with Colombia thru diplomatic channels.

In the light of the facts and arguments presented in these pages, let us consider the desirable procedure for our Government. We now have a chief executive who for the first time in the annals of history says as the head of a great nation that he is willing to refer "*all*" disputes, even those supposed to involve national honor, and he has already negotiated treaties to this effect with England and France. But before international law, all nations, great and small, stand on an equal footing. Why should he not magnanimously treat Colombia as an equal, removing her cause of grievance and hatred?

Colombia claims that we broke the treaty of 1846, and that but for us the planning, execution and maintenance of Panama's *coup* would have been impossible. The facts from our official records corroborate her claim. She does not ask the impossible return of Panama, but simply a settlement of the damages she has suffered, either by direct negotiation or by reference to The Hague. Is not this perfectly reasonable?

One New Yorker recently returned from a business tour in the tropics said to me: "On account of the feeling against us in Latin America because of the Panama affair we have lost in trade more than the whole Canal will cost."

Mr. Roosevelt's declaration, "I took the Isthmus," does not, of course, alter the ethics of the affair, but being an avowal from the responsible Executive simply makes it more than ever imperative, now that the heat of the ardent desire to see the Canal started is past and the work is nearing completion, to see that justice is done so effectively that the reputation of the United States for fair dealing shall be re-established thruout the world, and especially in Latin America.

As to the present status of affairs with reference to Colombia, Mr. John Barrett, in a recent interview, said:

"Owing to the fact that, in my position as Director General of the Pan-American Union, I am an international officer, that is, an official alike of the United States, Colombia and Panama, it is absolutely forbidden that I should express a political opinion as to the right and wrong involved in any issue between these countries, or as to the best method of settlement. I can, however, in a personal capacity say that, because of my cordial personal feelings toward the Colombian people and the Colombian Government, I would welcome such action on the part of the United States Government as would help remove the feeling against the United States which undoubtedly prevails to a certain extent in Colombia today on account of the Panama question. . . . Such action would prove to be bread cast on the waters of both friendship and trade, and would soon be shown to be a wise policy thru the increased commerce and confidence that would result from a new era of good-will in this way inaugurated."

Shall the claim be settled by direct payment on behalf of our Government or by reference to The Hague to ventilate the whole question and assess the damages?

We have already seen that Representative Rainey is active for an examination of the whole subject, and favors reference to The Hague. Speaker Champ Clark, prospective standard-bearer of the Democratic party, said:

"I do not really see what President Roosevelt's declaration 'I took the Isthmus, let Congress debate,' had to do with an honest settlement of any claims that Colombia has against the United States. If we owe Colombia anything, it ought to be paid, and, if we do not owe her anything, her claims for indemnity ought to be rejected. I feel reasonably certain that before Congress votes any money to pay her claims for indemnity it will sift the transaction to the bottom. Never having investigated the matter sufficiently, I am not in a position to pass on the merits of her claims."

Mr. Sulzer, of New York, the chairman of the important Committee on Foreign Relations of the House of Representatives, said:

"I am heartily in favor of the Rainey resolution as a non-partisan measure in the interests of justice and national honor. In my opinion the resolution will be reported unan-

unquestionably. There can be no question of undoing the establishment of Panama as a separate nation, but the responsibility of the United States in the matter of its 'secession' and the alleged violation of all international law and precedents should be thoroly ventilated; and I trust that the matter will be laid before the Hague Court whose decision shall impose upon the United States a payment in full for such damage as we may be found to have caused Colombia for the loss of the Isthmus."

Senator Gallinger, of New Hampshire, has given this subject careful consideration and is willing to have THE INDEPENDENT say for him that

"If there ever was a question that was appropriate for consideration at The Hague, this matter of Colombia's claims against the United States in regard to the loss of Panama, in my opinion, is certainly suitable for such a solution. I earnestly desire to see such steps taken as will leave the whole matter to The Hague Court and thus enable the United States to make such settlement of the matter as is called for by the impartial study of the facts. Of course the independence of Panama cannot now be called in question but simply the matter of our indemnity to Colombia for her loss."

Not all, however, are of the opinion that the case calls for arbitration. Senator Newlands, of Nevada, one of the advanced thinkers of the day and a man of great influence at the national capital, in discussing the matter of Colombia's claims said:

"I am a hearty advocate of the arbitration of all controversies. But I seriously question whether the matter of Colombia's claims against the United States is one that should be left to The Hague. There can be no question of disestablishing the independence of Panama now recognized as a republic by most of the nations of the world. The only question under the present circumstances is the matter of the indemnity due Colombia for our having broken the treaty of 1846 in assisting the secession and preventing Colombia from taking action to squelch the establishment of Panama as an independent nation; and our hasty recognition of Panama without the usual accepted precedents of national life. The evidence on these points is so clear that any court of arbitration would find against the United States and I should favor the payment on our part of an indemnity which would be the maximum that a fairly constituted court of arbitration could find, viz., $10,000,000, a sum equal to that paid Panama, and a further sum which at interest after nine years' accumulation would yield Colombia $250,000 per annum. By such payment we would completely clear our skirts and restore the good will of the Spanish-American countries, so essential in the development of our commerce. I would not make this payment in a direct lump sum to whoever chanced to be the President of Colombia, but make the payment according to the unanimous opinion of a representative of Colombia's treasury and one of the treasury of the United States in such a way as to insure the money being used in the best possible manner for the restoration of Colombia's credit and the benefit of her commerce."

Senator Bacon, of Georgia, when asked his opinion, presented me with a copy of his speech in the Senate on January 29, 1904, as representing his sentiments then and now. After his powerful general argument, he quoted from an editorial in THE INDEPENDENT the following:

"Under proper provisions, we should favor such a reference to The Hague Court of the main question between Colombia and this country. Whether our officers were right or wrong, we ought to be equally ready to abide by the verdict of such an august tribunal of the nations."

Senator Bacon also said in the course of his speech:

"I am strongly of the opinion that the very best investment we could make in connection with this matter would be a liberal concession to that country which would remove the present feeling of hostility and make those people our friends in the future. . . .

"The question of submission to arbitration is not the first or the main question in the resolution. It is the secondary question and the minor consideration. The main proposition and the one of greatest importance is that we will in a conciliatory spirit endeavor to agree with Colombia. . . .

"We should, as his constitutional advisers, say to the President: 'We advise that there shall be such conciliatory negotiations between this country and Colombia as will bring about, as soon as practicable, a friendly condition of affairs.' . . .

"Do we delay because the great United States are too proud, too vainglorious, to offer conciliation to a feeble people powerless to cope with it? I am sure, sir, that this is not the wish of the American people, but that, on the contrary, it is their wish that examination be made and that whatever is due to Colombia from us shall be paid in liberal measure. . . .

"Is there any dishonor in our negotiating with Colombia that she shall make a quitclaim to that title? . . .

"I am, sir, willing for one, and I believe the American people are willing, that we should deal liberally with the Colombians, because, I repeat, what are a few paltry millions to this great Government compared with the great advantage to this Government of making a friendly, satisfactory arrangement with that people?"

In view of the opinions quoted, the fairmindedness evidenced by all, and the

strong desire to do justice to Colombia avowed by some, my own conclusion can be brief:

We want the good will of Colombia, as that of all Latin-America, and the respect of the entire world. But do we want an arbitration where the United States would certainly receive an adverse decision after a worldwide ventilation of the whole disgraceful tale? I think not. As Mr. Barrett said, settlement with Colombia would be simply bread cast on the waters of Latin-American trade, which would come back to us in short order in the increased commerce that would result from the good feeling engendered.

Since the "secession" Colombia has had as its motto "Peace and Work." Its government is representative of both political parties. Reyes began its regeneration—he doubled the price of Colombia's bonds on the London Exchange, put the army to work on the roads, and paid the salaries of the employees, as well as trebling the number of schools. Gonzales Valencia, who succeeded Reyes, kept up the good work. Now President Restripo has placed the country's credit higher than ever and shown a most creditable record.

Colombia's worst drawback is her fiat money, a relic of the days of the civil war (1899-1902) that all agree shall be her last. With this redeemed and the currency on a gold basis, she would soon be prosperous indeed. Colombia is a country of infinite natural resources and industrious inhabitants, and a brilliant future awaits her as soon as the curse of valueless papers is removed. The prosperity which resulted in Argentina when the basic element of circulating medium was supplied will follow as surely in Colombia.

A payment to Colombia of $25,000,000, in the manner suggested by Senator Newlands, and a new treaty of friendship and commerce, would be an excellent investment for us, and would completely wipe out the smirch on our honor.

In conclusion a very brief summary of the facts shows:

First. That while the Hay-Herran Treaty was under consideration, our Government attempted to coerce Colombia by threats of hostile action.

Second. That our Government had knowledge long in advance of the proposed secession of Panama.

Third. That the very day before "secession" was proclaimed our Government, being at peace with Colombia, broke neutrality and intervened in the internal affairs of Colombia, and forcibly prevented our sister republic from landing troops on her own soil that would have quickly put down the rebellion.

Fourth. That after the "secession" our Government, not that of Panama, prevented larger bodies of Colombian troops under Generals Reyes, Ospina and Holquin from reaching Panama as was their right.

Fifth. That our Government precipitately recognized Panama as a nation before any proper Government had been formed or before any but a small minority of the people had knowledge of her secession.

Sixth. That our Government received as Minister Plenipotentiary of Panama, an alien who was at the time a French subject and was neither a citizen of Colombia nor of Panama, but who was with certain individuals in the United States deeply interested in the shares of the French Canal Company that were to be made valuable by the "secession."

Seventh. That the Panama Government could not have maintained its existence for a single day but for the direct or forcible aid of the United States Government in clear violation not only of international law but of its obligations to Colombia under the treaty of 1846.

In view of these seven facts I ask:

Would our Government have acted as it did had Colombia been as strong a Power as the United States?

If not, then is not weak Colombia entitled to reasonable compensation for the seizure by our strong Government of a valuable part of Colombia's territory, using for the purpose the raw Panama Government as a cats-paw?

Can our Government, which, from humanitarian motives, returned twelve millions of dollars to China and spent a hundred million to free Cuba, refuse equitably to compensate Colombia?

New York City.

# The Crown of King George

BY POULTNEY BIGELOW

THE INDEPENDENT asks my impression of the great coronation in London and it is soon given. Beautiful weather, immense enthusiasm, dense crowds, admirable police, thousands of Americans, scarcely any accidents or police court episodes, a Cinderella coach drawn by eight beautiful cream-colored ponies, Lord Kitchener and Lord Roberts; miles upon miles of battle-scarred warriors from Australia, Canada, South Africa, Egypt, India. Then at night much illumination, and soon thereafter London resuming her everyday aspect of business men going to their offices in high silk hats, frock coats and umbrellas—the Cinderella coach tucked away in the strap-and-buckle museum back of Buckingham Palace—and then the money-minded minister in the Royal Cabinet counts up the cost and some people will be asking him if he has not paid too dearly for the Cinderella coach parade and the many costly concomitants of a display which appeals primarily to the eyes and ears of the multitude.

So far as the mere show is concerned Germany made a vastly more impressive demonstration of bands, bayonets and uniforms when her victorious army entered Berlin after Metz and Sedan; the old Emperor William, Bismarck, Moltke, symbolizing the military strength that is born of unity in military command.

From the standpoint of the artist the English coronation would suffer by comparison with national displays which I recall vividly in Paris under the Third Empire, for Napoleon III treated his capital in the spirit of a master impresario and no sacrifice was too heavy on the public purse when it was a matter of exciting the admiration of an esthetic people.

We have had our own efforts in the line of monster displays, but they have been conspicuous rather for the number of those marching in line, the volume of noise and the square miles of bunting than for the harmony or completeness in the total effect. Our most recent offense was in honor of the discovery of the Hudson and the opening of steam navigation; and those of us who recall the large sums of money spent and the deplorable results will agree with me that government by the people has other virtues than the organizing of dramatic pageantry.

From the point of view of mere eyes and ears the great coronation was possibly inferior to what Germany and France might have produced in combination, but neither the one nor the other of those great countries could have given to the world so striking an object-lesson in the art of government for the people by the grace of God and the practice of justice.

The little Cinderella coach with its cream-colored ponies carried thru the throngs of London a little crown and a little sceptre and a beautiful cloak of ermine and possibly a few more symbols about which I confess profound democratic ignorance. Indeed we share no doubt the same feeling when at High Mass in some great cathedral we marvel at the many holy utensils and priestly actions which leave us comparatively cold, altho we reverently note the fervor with which the service is followed by an initiated body of worshipers.

The little Cinderella coach and its symbolic cargo of monarchical mummery for three days proceeded by different routes thru packed millions of loyal Britons, so that scarce an Englishman could say that even the poorest was debarred from seeing his King in those momentous days. The little Cinderella coach ambled along indefatigably thru the miles and miles of that marvelous complexity we call London, but which is in fact a federation of many self-governing towns, each welcoming its sovereign in its own individual capacity. The so-called slums of London, the great East End wilderness, no less than the centers of high finance and the homes of clubs and rich people—all were included in this royal progress, and all bowed down in reverent gratitude before the cargo

of symbols, which to the uninitiated Yankee means little more than the gaudy band-wagon of a country circus.

And all this is what I see, not in some little medieval hamlet of Austria or Spain, but in the world's capital of commerce and progressive legislation. These great processions of the King were not mere demonstrations of soldiery such as that of the First German Emperor on his return from the French War; nor a theatrical staging of city streets paid for out of the people's taxes as in the time of Louis Napoleon. The King of England moved thru the dense masses of his own people in a glass coach which might have been shivered by any stone from the gutter; the whole cargo of symbols was fearlessly exposed to any treatment that could be suggested to the minds of a dissatisfied people. We saw no Secret Service men behind his coach nor could the naked eye discover precautions which we associate with the movements of our own Presidents. There must be more than tinsel and bauble in a monarchy that can do this for three days, and in the doing of it stir up in the great world-wide British Empire respect for the King and above all confidence in monarchy as an institution.

In these coronation days I saw troops sent by free colonies from every corner of the English-speaking world. They came not as vassals bearing tribute, but as children of a common Mother coming home to the ancestral halls as honored guests. All this took place at a time when the political world of England was agitating such questions as the abolition of the peerage, curtailment in the privileges of the land-owning aristocracy and innumerable Socialistic measures which would have been regarded as revolutionary fifty years ago. Lloyd-George is today what Wilkes was to Conservative Englishmen in the days of George III. In carefully reading English history it will be hard to select any period when in the opinion of half the people the country was not on the high road to perdition. Our school historics have taught us that England was thoroly rotten in the days of George Washington and it is the favorite theme of the German official press today that the British Empire cannot much longer hold together and that as the old Roman Empire fell to the share of Charlemagne so must the crown of George V soon be annexed to that of the Hohenzollerns.

But the Germans are men of the schools and the British are of more practical stuff. They have been going to the devil for now more than one thousand years, and for reasons which no schoolmen can satisfactorily explain the devil will none of them, and the tight little island survives one crisis after the other in a manner most irritating to those who have already selected mourning for the final obsequies in London.

England today suffers severely in some branches of industry, yet on the whole we cannot name another country where life and property are more secure; where liberty of person is more general; where political life is more clean, and where labor is more sure of steady and remunerative employment. In the past year England has built more ships than ever before. She attracts to her shores and to those of her Colonies each year many thousands from other countries, who come not merely to make some money and return home again, but a large proportion who bring their fortunes with them and found English families.

The world today appears to one who reads only newspapers as rapidly running toward republicanism, and no single influence has been perhaps so potent as our own country in achieving this result. Our experiment is but of yesterday—not even two centuries old. We have become accustomed to institutions which when inaugurated look like the act of madness to a conservative mind. In this State our judges are elected by the people or nominated by politicians; we have repudiated monarchy so completely that even when we find an efficient President we do not allow him to serve in office more than a few years. Our representatives in Congress receive high salaries and by their votes we have now a protective tariff which makes the cost of living to an American almost four times what it is in Europe. This same protective tariff has created great industrial combinations which compel an American to pay more for the product of American factories than an Englishman for the same article. The American flag has now become a curiosity in foreign ports, thanks to so-called Protectionism. Our

wages are high when measured by money alone, but when measured by true standards which are those of family happiness we think that Protectionism has not benefited the farmer or the laboring man to the same extent that it has enriched a small class of manufacturers. We have our annual crop of strikes, lockouts, tramps, soup-kitchens, unemployed and every other symptom of political decadence; and yet abandoned farms are abundant thruout our older States to say nothing of virgin land out West. Our cities can show human congestion, filth and disease worse than anything that I have ever seen in London, Paris, Berlin, or even Genoa and Naples. We are a whole generation behind England in municipal cleanliness, in postal service, in making of roads and maps—and yet we have more universities to the square mile than any country in the world and more experts and specialists in every department of advanced thought.

"What has all this to do with the coronation?" asks the editor, angrily.

The coronation is a symbol, and the symbol, like the fable, is to set one thinking. Your Englishman goes in for practical things; he is a little old-fashioned but makes an extremely comfortable country for the world at large to come and stay in. We here clamor for equality—the Englishman does not, but he treats all men as equal before the law including Chinese and Japanese. The Englishman pays his judges and his officials enormous salaries, but he expects and gets enormous honesty. The English Government is run on a business basis; ours is run with the extravagance of a college football eleven. Our Congress is a very expensive and inferior machine for making laws while the British Parliament pays no salaries to its members and has on its latter-day rolls such names as John Morley, Gladstone, Lecky, Macaulay and a host of similar spirits who ask no other payment than the satisfaction of an honorable ambition. It is no exaggeration to say that the cash cost of the New York Board of Aldermen, plus the State Legislature, is more than that of George the Fifth and all his relations on both sides. In other words the cold-blooded Briton discussing this matter in counting-house manner with a friendly Yankee cheerfully admits all the vices of monarchy in the abstract, but after personal scrutiny of Albany and Washington in the concrete drinks cordially to the health of President Taft and thanks God in his heart for the Cinderella coach and the cream-colored ponies.

LONDON, ENGLAND.

# Newport, Society's Summer Capital

[The author of the following article has had ample means to learn of what he writes. As this is now the hight of the Newport season, we think this brief account of some phases of the social life of the ultra-fashionable set there will not be without a certain interest to the rest of the American people.—EDITOR.]

AT no other summer resort in the great Republic does the contrast between a European upper class and our American plutocracy stand out so glaringly as at Newport. European nobility find in society in general, and particularly in summer migratory residence, a relaxation, a surcease from care and worry. The ultra-fashionable American, on the contrary, finds in society a treadmill from which there is no shuffling out, the giving and attending of a round of social functions which cannot be neglected without imperiling, or more often actual loss of, caste.

Since the passing of Mrs. Astor, the acknowledged leader not only of Newport, but of American society in general—for there is a national ultra-fashionable set distributed thru several of our cities—is Mrs. Ogden Mills. Devoid of aspirations for national social leadership, making no effort to blend various social sets, her dances seldom outnumbering 150 people, and her dinners thirty or forty guests, Mrs. Ogden Mills is accorded this exalted prerogative by the tacit acclamation of the American ultra-fashionable world. Born a Livingston of the Manor, of large and lucrative estates, Mrs. Mills is naturally guided somewhat by a predilection for patri-

cian birth and breeding; still, of the older families moving in her circle, nearly all consist of those still possessed of wealth enough to keep fashionable. Men possessed of the aspirations of dukes and the fortunes of footmen are very rarely seen in an Ogden Mills drawing room.

Since the death of Mrs. Astor, and from a complexity of causes, the power of money has asserted itself as never before in the annals of Newport society. A host of society folk, both all-the-year-round residents of Newport and cottage owners from New York, some of whom were often guests at Mrs. Astor's dinners and balls, are now almost wholly omitted from the guest lists of the smart dinners and dances. One says *dances* advisedly, for society at Newport has grown too exclusive to give functions large enough to be termed balls. Society's structure in the meantime has become much more artificial, its membership more arbitrary and capricious, and its rank far more contingent upon the giving of social functions.

Altho 50 per cent. of the men, in common with their families, stand ready to pledge their careers, their fortunes, and their sacred honor to the shibboleth of "class," still, a goodly number of them fret and fume over the distance of Newport from New York, and absent themselves a good share of the week, except in the hottest weather. However, as it is the women who really set the keynote of Newport as well as of fashionable society in general, the record of a day's doings of a Bellevue avenue matron will serve as a sort of index to what manner of life obtains at this the queen of American watering places. Coffee is served at ten a. m., before rising—an hour earlier than when in town, in order to allow time for a dip in the ocean between eleven and twelve o'clock down at Bailey's bathing beach, which is controlled by a close corporation of cottagers. By the way, it is not until this season that sea bathing has become really fashionable among Newport cottagers. The latest *on dit* is the project of building not only a solarium for the bathers down at Bailey's, but of adding a miniature crystal palace of banqueting and ball rooms. It would be so convenient for a three o'clock a. m. dip in the surf after the dance and far more exclusive than the Casino at all times. But to turn another leaf of our Bellevue avenue diary. Breakfast consisting of fruit, a roll and coffee, an egg and a sliver or two of bacon at caprice. Two maids in attendance, one to assist with the toilette and another with the breakfast. If the grande dame chances to affect auburn hair and is one of the extremely few even of Newport's habituées who is in possession of the celebrated formula for producing Titianesque-hued locks, obtainable only under rare conditions in Paris, she will pass the better part of two days of each month of hot weather in solitary confinement with her maid, going thru this startling and lugubrious "process." The first application of the paste turns the hair a jet black! The second, which is spread over several hours later, transmutes it into a vivid copper green! The third and final poulticing, which is applied much later, turns the hair into a glossy auburn—the ideal shade over which poets and painters have raved time out of mind. It is almost needless to add that subsequent headaches are ascribed by the fair chatelaine to any except the right reason.

But as this is not the day of the Titianesque ordeal for our Newport chatelaine, with its enforced seclusion, the same marvelously expert French maid, who is, in effect, a beauty specialist, follows up the cold cream enameling and massaging of the night before with a roseate liquid beautifier, either *rouge vinaigre* or Imperial Venus tint, both of which, she flatters herself, will prove impervious to the ravages of sea bathing.

Ensconced in her solarium boudoir looking down toward the Cliff walk and the ocean, or in a shaded upper porch with the same marine view, our lady glances at her morning's mail and her book of engagements in the company of her social secretary, dictating replies, if any are urgently needed, tho as much of the communication is carried on by telephone as courtesy will allow. But what weighs on her mind is the list of dinner guests to be made out on the morrow, and invitations to be sent for a banquet of a hundred people, with dancing afterward. An impending divorce scandal affords the complication. Under pre-

rest to her social secretary that she is peering far out into the ocean to descry an incoming yacht, she mentally indulges in soliloquy:

"Mr. and Mrs. Blank are important on other lines than the moral ones. I might try to omit Mrs. Blank from my dinner and visiting lists, just as I did Mrs. X, who was divorced on the statutory grounds, and end by turning turtle and gushing ecstatically over her afterward, just because a dozen intimate friends are insisting that she and her husband are necessary adjuncts to society. Some of our foremost financiers and most representative men have their affairs, yet they are cordially received everywhere, and in most cases the society woman in the intrigue is welcomed to our drawing rooms, provided she wields social power. In spite of this undercurrent of talk which has come to the surface in *Town Topics,* the Blanks are received everywhere. I will be loving and forgiving; the ignoring eye is the better, and I will not erase them from the list. The omission would be so pointed, in the face of all the hospitality we have just accepted from them. Besides, one would be hated by a whole group of their relatives and friends, were any blacklisting attempted. As for that matter, nearly half of our families of first rate celebrity and any size have some sort of a *cause celébre*—divorce or worse."

Next in order, the housekeeper or maitre d'hotel is commanded to receive a few directions perhaps about the menu for a dinner to be given on Sunday evening, or criticisms to be passed on the marketing. The late Mrs. Astor's state dinners, altho of excellent quality and in approved taste, were each a duplicate of the menu of the previous ones. A blasé society like that of Newport hankers after novelties. And our hostess knows well that where the head of an establishment herself takes a personal interest, the best cuisine is almost always to be found. To live like the Gerrys and Berwinds, for example, has become the Lucullian proverb of the day at Newport.

After a refreshing dip in the ocean at noon and a sunshiny dalliance on the golden strand at Bailey's, the chauffeur whirls his mistress and her maid back thru Bellevue avenue in time for the former to dress for a large luncheon party of women, followed by bridge, to be given at Berger's by a young matron actually stopping at a *pension,* who thus pays off the social debts of the season, having received a thousand-dollar cheque from her father-in-law for that explicit purpose. It is only young couples who are the scions of families of stellar social prestige and great wealth who have the temerity to stop in *pensions* at Newport. But there are upwards of half a dozen young couples thus placed who follow this somewhat plebeian program every season.

At the entrance to Berger's, our lady fairly collides with a young man who is crossing the threshold in company with a wealthy Italian nobleman of royal blood, a relative of more than one European monarch, who has just arrived and is destined to be the lion of the season. She gives a stony and flaunting cut to the young American who is really of an eminent old Southern family far outclassing the tradesfolk from whom she herself sprang. He is the young tenor who sang at her dinner the night before and to whom her secretary has just mailed his check. He has been in her *employ* and he must not be recognized in the presence of Society; he must be ignored along with the servants and the tradespeople. His singing of the night before her guests went into raptures over. The young tenor had sung at a chamber concert at the Quirinal Palace in Rome, the Queen had congratulated him in person and afterward bowed to him on more than one occasion from her carriage on her drives in the Pincio.

The bridge following the lunch of costly favors and floral garnitures is somewhat curtailed, nearly all the guests having pledged themselves either to take active part or patronize a garden fête to be given for charity, on the lawn of one of society's foremost entertainers. Whenever the market has been bad and Wall Street depressed for a season or more, a whole crop of charity entertainments springs up at Newport. This form of altruism is proving as much of a blessing to society at Newport in this "off" financial summer, as it is to the objects of its almsgiving; for it helps to save society from what is the sword of Da-

mocles ever hanging over the American ultra-fashionable set—from being bored by itself.

The query is often put—of what would the average expenditures consist and what sum would they aggregate for a family to maintain a villa at Newport for the season, and move acceptably in the ultra-smart set? There is such a nexus of qualifying conditions that it would be almost futile to essay an enumeration of particulars for such an induction. There are families well placed and moving in the ultra-exclusive set whose manner of living and equipage is almost humble in contrast to that of Mrs. Vanderbilt, Colonel Astor, the Belmonts, Gerrys, Berwinds, Townsend-Burdens, or Arthur Curtiss Jameses. But most of these mediocre spenders are related to some of the great houses and bound by ties of almost inseparable intimacy to others. Of course, a lady cannot be seen walking on Bellevue avenue any more than a member of the resident nobility can on the Corso in Rome.

Granting us our own major premise, however, we will attempt a bill of particulars for a family which has a measure of social *entrée*, but whose chief asset and claim to recognition will be the expenditure of money. A hundred thousand dollars could easily be dissipated from the 1st of July to the end of the Newport horse show, about the 10th of September, not inclusive of the expense of keeping a yacht, which always enhances the success of a summer social campaign. Suppose such a postulant for social honors is to build a villa at Newport. As the resort is suffering from the lack of a fashionably appointed summer hotel and two-thirds of the cottagers are opposed to it, the success of the summer section of the island is somewhat dependent upon additional villas being built on some of its large outlying acreage, to compensate for the empty ones of cottagers passing the summer abroad. A show place, something altogether out of the ordinary, which is destined to pique society's jaded visual sense, cannot be built and furnished for less than a million dollars, not inclusive of the grounds, *e. g.*, the magnificent Arthur Curtiss James establishment, whose doors have just been thrown open to society at Newport. *In limine,* then, your Newport season is annually going to cost much more than $50,000 for a roof over one's head, say $70,000 covering the interest on the money invested, taxes and repairs. For entertaining, living expenses, servants' wages, fuel, electric lighting, etc., for the season, $20,000. For what new automobiles may be needed (nearly every member of one's family being supplied with one, aside from several for general use), chauffeurs' salaries and incidentals $18,000 is a conservative estimate. Modistes' bills, dressmakers' bills, tailors' bills, and other personal expenditures of the family are, of course, not included in the figures.

In short, to live in Newport as the Newporters do, one must spend all his time and money at it.

NEWPORT, R. I.

# The Song from the Crag

BY WILLIAM BYRON FORBUSH

I stood upon the shoulder of the crag
Where the wind was fresh and free
I heard the snowlike murmur of the pines
That sounded dreamily:
The pines that some day should be naked masts
Were singing of the sea.

I lay upon the rough breast of the crag
And warm it was to me
I thought it whispered to me all its hope
In a mood of solemn glee:
The rock was talking of the temple wall
Of which it was to be.

And there upon the hoar-clad, warm-cheeked crag
My own heart spoke to me.
My soul was singing of its havens far
And its immortal Sea;
My life communed of God's great Temple Wall
Of which it is to be.

NEW YORK CITY.

# Christian Science and the Medical Profession

BY AUGUSTA E. STETSON, C.S.D.

[Mrs. Stetson has been consecutively, organizer, pastor, reader and spiritual head of First Church of Christ, Scientist, New York City, since 1887. She was recently expelled from membership in the Mother Church, in Boston, by its Board of Directors, who also revoked her license to teach Christian Science. There are abundant documentary evidences, however, which prove that Mrs. Eddy ever held Mrs. Stetson in the highest affectionate esteem, and considered her a most advanced demonstrator of Christian Science. We are glad to print, therefore, this reply to Dr. Chapin's recent and valuable article.—EDITOR.]

I HAVE just read an article in THE INDEPENDENT of June 29, entitled "Christian Science and the Child," written by Henry Dwight Chapin, M.D., which he concludes thus:

> "It is time for plain and emphatic words. An appeal should be made not only to the intelligence, but to the public heart and conscience by those who can speak with knowledge and authority."

I accept the invitation, and appeal to the public heart and conscience, since I can speak with knowledge and authority—the divine authority of the great Master Metaphysician, Jesus the Christ, who healed all manner of diseases with the Word—the power of Truth, the Christ Mind—and left his mental method of healing sin and sickness as a rich legacy to his followers. Jesus' method of healing by mental therapeutics should appeal to the heart and conscience of humanity as it did to our revered Leader, Mary Baker Eddy, the Discoverer and Founder of Christian Science Mind-healing.

Divine Metaphysics or the potency and supremacy of spiritual thought over the discords and diseases which result from material thought, should be investigated, understood and proved. Having witnessed for centuries the failure of the noblest and most learned physicians to destroy the *cause* of disease, and thereby prevent its manifestation on the human body, humanity's cry for deliverance from sin, sorrow, suffering and death, reached the great heart of infinite Love and brought the healing power of the Mind of Christ.

As "all causation is Mind, and every effect a mental phenomenon" (Retrospection and Introspection, page 21, Pkt. Ed.), and as but one God or Intelligence is admitted by Christendom, it follows that man, in the image and likeness of God, his creator, must be spiritual, and the old theory of mind and matter, or man as both spiritual and material cannot be entertained; therefore we witness the passing away of old things (material thoughts) and their objectified phenomena, which for ages have been expressed in sin, sorrow, disease and death. Spiritual thought, the Christ or Truth, objectifies, externalizes *its* phenomena—health, holiness, love and joy—and the power of the Word of God, through man, thus lessens and eventually will destroy all evil, disease and death—the wages of sin.

The sinner and the sensualist are not willing to pay the price which Christ demands of those who would heal as *he* healed, who would gain the dominion which *he* gained over all sickness, sin and death. Whoever is willing to attempt the practice of Christian Mind-healing through self-abnegation, meekness, purity and divine love for God and man; whoever is willing to live the life of Christ and attain spirituality will finally perform the healing which Jesus promised to those who would take up his cross and follow him in his ministration of unselfed love for suffering humanity. The reward of this sacrifice of material self is the redemption of man's birthright—dominion over all the earth—and the consciousness of an endless life.

Dr. Chapin's sympathy for children is most commendable from his viewpoint of material reasoning and *materia medica;* but from that of the metaphysician who is turning from time-honored theories and theological assumptions concerning God, man and the universe, and

who has become dissatisfied with undemonstrable creed, dogma and therapeutics, comes the query, "What is Truth?"

I have great respect for the conscientious, unselfed members of the medical profession, whose lives are devoted to the relief of suffering humanity. Let them continue to serve mankind according to humanity's demands. Material methods appeal to and satisfy the wants of those who have faith in the efficacy of drugs to relieve disturbed physical conditions, and such persons respond only to material measures. Therefore the matter physician is as essential today to meet the requirements of mortals as the metaphysician is necessary to fulfil the needs of those who require the potency of spiritual Mind-healing.

The matter physician must not disagree with the divine Metaphysician on the question of the spiritual mental method of healing sin and disease. Progress is the law of God. Mortals cannot arrest the chariot-wheels of Truth. The latent possibilities and living energies of man, when governed by God—divine Mind—the Principle of being, are continually being revealed.

"Man made in His likeness, possesses and reflects God's dominion over all the earth." (Science and Health, page 516.)

Dr. Chapin knows that in his own profession many practise without sufficient knowledge of therapeutics, and thus deceive the people. So, in Christian Science, many are masquerading as true followers of Christ and of our revered Leader, Mary Baker Eddy, who impose their mental, so-called healing upon the public. They have not the spirit of the Master Metaphysician, Jesus, our Way-shower to eternal Life. They do not emulate his example nor obey his instructions. They do not understand even the letter of Christian Science, and when questioned, evidence a lack of comprehension of the Principle of scientific being as taught by Mary Baker Eddy in the text-book of Christian Science. These should advertise as mental healers from a material basis, and let the people choose whether they prefer hypnotic, mesmeric, temporary relief, or Christian Science Mind-healing, the destruction of sin—the *cause* of all disease, suffering and death.

If a Christian Scientist possesses the qualities of the Christ Mind sufficiently, his spiritual thought will neutralize and cast out the qualities of the carnal mind which produce suffering. In the degree that a Christian Scientist assimilates himself to God he demonstrates the power of the Word, and proves Jesus' saying: "The Father that dwelleth in me He doeth the works" (performs the healing). (John 14:10).

In this revolutionary period—the passing away of old systems and methods based upon material hypotheses—humanity is accepting Mind as "the Source of all movement" (S. & H., p 283), and is discriminating between the effect produced by the spiritual thought, and that which results from the belief of life in matter, or the material thought. Many are choosing the former, and repudiating and resisting the latter. With this spiritual uplifting of humanity's ideals, what remarkable effects we may anticipate in the child of the twentieth century, whose plastic mentality receives mental impressions as readily as the talking machine of today records voice and words on the wax disk.

In the past, the mental inoculation of fear, anger, and other qualities which comprise mortal mind, and which were often reflected to the child by parents and friends,—all these mental impressions have for centuries worked disastrously on the mind of the child, until the mighty power and presence of Truth have appeared the *second* time, and have aroused humanity to resist bondage to mental illusions and hallucinations, which compose the so-called material man and the material universe. God, the spiritual man and the spiritual universe must sooner or later appear as the ever-present, deathless reality of being.

Dr. Chapin cites the case of a little boy, three years of age, who developed "obscure digestive symptoms." He adds that the mother was frantic with grief and fear when she learned from the doctors that "the only chance for life lay in an operation." He says the Christian Scientist who undertook to heal the case proved unequal to quiet the mother's fears or to relieve the child. Did the doctor investigate this case to ascertain whether the person who was ministering to the child was a true, competent, con-

ecrated Christian Scientist, or a so-called mental healer, who was not a reflector of that divine Love whose omnipotent force casts out fear, and, as our Leader says, "will reinstate man in God's own image and likeness" (People's Idea of God, page 14, pkt. ed.).

Mrs. Eddy, in referring to a mother's thought-impression upon her child, writes as follows:

"If a child is exposed to contagion or infection, the mother is frightened and says, 'My child will be sick.' The law of mortal mind and her own fears govern her child more than the child's mind governs itself, and they produce the very results which might have been prevented through the opposite understanding. Then it is believed that exposure to the contagion wrought the mischief.

"That mother is not a Christian Scientist, and her affections need better guidance, who says to her child: 'You look sick,' 'You look tired,' 'You need rest'." (S. & H. p. 154).

Further, to show the necessity of eliminating fear from the mind of the child, Mrs. Eddy uses ghosts as an illustration. Mental pictures of disease, with their accompanying manifestation, should be treated by every mother as ghosts, and be made as unreal to her child.

"Would a mother say to her child, who is frightened at imaginary ghosts and sick in consequence of the fear: 'I know that ghosts are real. They exist, and are to be feared; but you must not be afraid of them'? . . .

". . . children should be told not to believe in ghosts, because there are no such things. If belief in their reality is destroyed, terror of ghosts will depart and health be restored." (S. & H. p. 352).

If disease were known to be the result of false teaching and false thinking—false or mortal thoughts externalized on the human body—the fear of disease would gradually be destroyed, and with the spiritual thought, men, women and children would free themselves from disease as effectually as they gain their freedom from the fear of ghosts.

Mrs. Eddy further says, in regard to children:

"Children should be taught the Truth-cure, Christian Science, among their first lessons, and kept from discussing or entertaining theories or thoughts about sickness. To prevent the experience of error and its sufferings, keep out of the minds of your children either sinful or diseased thoughts. The latter should be excluded on the same principle as the former." (S. & H., p. 237).

Until physicians and the people witness for themselves the influence of spiritual thought, the reflection of Life, Love and Truth, on the mind of the child, they will not be ready to accept Christian Science. But they must finally awake to the scientific fact of being, as stated by Mary Baker Eddy: "All is infinite Mind and its infinite manifestation, for God is All-in-all." (S. & H., p. 468.)

In "Unity of Good" Mrs. Eddy writes: "The chaos of mortal mind is made the stepping-stone to the cosmos of immortal Mind." (P. 56, Lib. Ed.) The chaos of mortal mind is turning many to contemplate something better than sin, suffering and death.

In my experience of twenty-six years in the teaching and practice of Christian Science Mind-healing I have learned that in proportion to my fidelity to God's law have I been successful in casting out error and healing the sick.

Dr. Chapin's article entitled "Christian Science and the Child" has recalled my experience with the children connected with the Sunday School of First Church of Christ, Scientist, New York City, in which for twenty-two years I devoted my earnest efforts to educating the children to understand the potency of spiritual thought, and their relation to God; to contemplate their divine selfhood, and to eliminate the false thoughts which express themselves in discord and disease upon the corporeal body.

During twenty-two years, the children, numbering at times over three hundred members, and ranging from three to fifteen years of age, seemed to be my special care whenever they were attacked by disease. Being a teacher of Christian Science Mind-healing, it was expected in the early days that I was an infallible demonstrator of the Truth-cure, therefore the parents of these children turned to me to prove my teachings for them. As all increased in the understanding of divine Metaphysics, and it was understood that Christian Scientists heal in proportion to their possession of the Mind of Christ, there was a more intelligent and reasonable requirement, and the practitioners were aided by parents and those associated with the sick, until all understood and applied to disease the Principle and rule of healing.

Without fear of successful contradiction from any parent or person, I can state that during these twenty-two years

but three Sunday School children have passed on—one with a claim of diphtheria, one with appendicitis, and the third of a ruptured internal blood-vessel. These are all the Sunday School children who passed from our sight with disease during the twenty-two years of my service in the Sunday School. I have treated successfully hundreds of cases of measles, typhoid, scarlet and slow fevers, and every disease which children meet between the ages of three and fifteen years, every case having been healed without drugs or any material aid, and with none of the serious after effects which often result from these diseases.

I refer to these cases of healing by the power of the Word as my reason for my defense of Christian Science Mind-healing, and I appeal to the intelligence and heart of the people as to whether I am justified, after such demonstrations, in adhering to the Principle and rule of scientific Mind-healing, demonstrated by Jesus and taught to me by my revered Leader and Teacher, Mary Baker Eddy. Mrs. Eddy questions the world today in these words:

"Which was first, Mind or medicine? If Mind was first and self-existent, then Mind, not matter, must have been the first medicine. God being All-in-all, He made medicine; but that medicine was Mind. It could not have been matter, which departs from the nature and character of Mind, God. Truth is God's remedy for error of every kind, and Truth destroys only what is untrue. Hence the fact fact that, today as yesterday, Christ casts out evils and heals the sick.

"It is plain that God does not employ drugs or hygiene, nor provide them for human use; else Jesus would have recommended and employed them in his healing. The sick are more deplorably lost than the sinning, if the sick cannot rely on God for help and the sinning can." (S. & H., pp. 142 and 143).

Mrs. Eddy testifies of her regard for the medical profession in the following words:

"It is just to say that generally the cultured class of medical practitioners are grand men and women, therefore they are more scientific than are false claimants to Christian Science." (S. & H. p. 164).

New York City.

# Save Time

BY DAVID STARR JORDAN, LL.D.

[The following article by the president of Leland Stanford, Jr., University is the substance of an address to the recent graduating class.—Editor.]

THE professor in civil engineering in Harvard said to me the other day, "The best advice I can give to my graduates in engineering is this, 'Let your competitors smoke.'"

In other words, if somebody must go through life carrying a handicap, let it be some other fellow.

The professor went on to say that he did not consider the matter primarily from the point of view of hygiene or of good example, but from that of saving of time. The man who succeeds is the man who knows how to use time. Life is a bit short at the best, and it seems much shorter when you get on into the middle of it. Its effectiveness is measured in part by its length. Its length is measured not by years, but by that part of it which we use. We use only that part we spend in sleep, in training, in play, in effective helpfulness. Smoking does not come under any of these heads. Smoking is our disguise for idleness. When a man smokes, says the professor I have quoted, he does not realize that he is idle. He is putting in the time, the time that he might otherwise use in some one of the normal purposes of life. Daudet tells us of certain clubmen who meet and think not, neither do they speak—just smoke.

One lesson of the college life is the value of training rules. If a man is to do his part in a game or a meet he must have every nerve free from prejudice. The effect of tobacco is to trick the nerves. It is a nerve irritant, and wears the disguise of a narcotic. But a narcotic is likewise dangerous. We ought not to be sleepy when awake. We have the right to sleep when we have earned it, by nerve exercise which demands nerve rest. To break the training rules

is to lose the game, when the game demands accuracy of sensation and motion, absolute truthfulness of nerve response.

But the essential purpose of going to college is to prepare oneself for the higher games, for the fine play in the noblest and most difficult of all meets, the fine art of living. In this game, one has need of all mental subtlety, of all virile reserves. Every day the test is closer than in any athletic game. Every day, more depends on one's being in perfect trim. Every man, sooner or later, at some time in his life is brought under training rules. If he is not, he is forced out of the business. Most usually these come too late. Every enforced lie of the nervous system makes it harder for it to tell the truth afterward. Every strain in accuracy of nerve-response makes the mind flabby.

There is an ancient rule of health which runs in this fashion: "Rise early, before you are twenty-five, if possible."

This rule I commend to you. That you have observed it already is plain enough. If you were not early risers you would not be here to-day. If you had not already mastered some of these precepts, we should not send you forth with the confidence that to-day we are showing. But there are maxims within maxims.

The secret of early rising is the saving of time. To rise at twenty-five, the thing to do is to be already thirty years old. Not thirty years old in waste and disillusion, like some old young men we know, but thirty years old through the saving of time from idleness for thought and will and achievement.

And in this the waste of smoke is only one of many kinds of waste, and the greatest waste of all is the waste of time. The great achievements of men have been for the most part in the intervals of a busy life. It is an old saying, that when you want anything done you must get a busy man to do it. The man of leisure cannot bring his power together. He may have his horses, but his hands are not on the reins. The years of life are threescore and ten, and we cut off twenty at one end for training, and Nature cuts off what she pleases at the other. But any man can make the other forty as long as he pleases. He can at least get twice as much time out of them as the average man does, and effectiveness in life is proportioned to the square of the time saved. In any event, momentum is proportioned to the square of the velocity. The velocity is measured by the ground you get over, by the time you save from idleness for life.

What is lost in waste must be deducted from our savings. The man who is thirty years old at twenty in dissipation and disillusonment, can count his living age at only ten. He counts ten years of life and ten of death, with ten years of childhood to begin with.

"The gods for labor give us all good things."

This was part of the philosophy of the ancient Greeks. They learned it as a fact of experience long before Epiharmus first put it into words. Over and over again each generation of men tries its own experiments and comes back to the same unvarying conclusion. Moreover, we find that these same gods never give us anything worth having for any other price. They make loans sometimes, but theirs is a high rate of interest. They do not forget the contract. "By their long memories the gods are known." By the gods the Greeks meant the forces that lie all about us, the forces that condition our life. These are our realities. The rest is dead matter. Our knowledge comes from contact with these ways and forces, our power depends on acting in accord with this knowledge. In this lies all human possibility. He who knows the truth can trust all and fear nothing. He who strikes as the gods strike has the force of the gods in his blows. He who defies them wields a club of air.

It has been a part of your college training to learn something of the laws and forces that limit life. To know where you are and what you can do, is the first element in the saving of time. You can rise early when the time comes for action.

You will hear men say, "The rich man must know how the poor man lives," else humanity cannot keep together. But you are poor in gold, I hope, tho rich in the better commodities of will and hope. So let us say, "The poor man must know how the rich man works," not the

rich men who have inherited land and bonds, and who do not know how to use them because they have not created them. These gilded paupers are not many in America, four hundred (are they not?) in New York, with a few thousand imitators, and in San Francisco and elsewhere in proportion. These do not count. They are but froth on the human waves, and it is not much trouble for us to carry them. But you must know how the strong man works, and if you would be strong you must struggle even as he does, and, if may be, with loftier ideals and more genuine aspirations.

Your place will be among the working men and women. Your society is a busy society, your race is a motor race, your nation is "a going concern."

There are other nations of a different temper, nations where every good and great work is to be done tomorrow. Why should we strain ourselves to day when to sit in the shade is so much pleasanter? Let us do things tomorrow. Tomorrow is time enough. There comes an endless succession of tomorrows. They have been coming since eternity. They will surely never fail.

But the land you live in is not the land of *mañana*. You may not lose yourself amidst its flowers and palms and bananas. You are on the right way thus far. This we know because you are here today. If it were not so you would be here tomorrow. You would wait for your education, for the day that never comes.

Each of you has powers and potentialities of his own, this for one, that for another. To make the best of what is in us, this is success in life. But our duty is only relative. It goes with the fact of time. With time enough, any of us could do anything. With this great multiplier, it matters little what the other factor is. Any man could be all men if he had time enough. With eternity man becomes as the gods. But we are not in business for eternity. Our days are few, however much we may stretch them, and, no doubt, as the humorist reminds us, "We shall be a long time dead," so every hour we waste carries away its toll from our life, as the dropping water carries away the rock. Every lost day takes away a bit, or a cubit from our stature. And so we come back to our first word again. Let us be alert, as becomes the men of the time. Let us rise early and let us make some mark in the world—before we are twenty-five, if possible.

STANFORD, CAL.

# What Australia Can Teach America

BY ELWOOD MEAD

[The author of the following article is an American engineer who has been engaged in various capacities in Western irrigation by Wyoming, Colorado and the United States Government. Three years ago he was called to Australia, and is now chairman of the State Water Supply Commission of Victoria. We comment upon the Australian policy in our editorial columns.—EDITOR.]

NO two countries can learn more of value from each other than America and Australia. These two democracies, one on the eastern shore of the Pacific and the other on the west, have, as our Minister of Lands has said, almost equal areas, the same language, the same governmental machinery and the same inherited traditions as to the rights and duties of men. Each country is practically in its infancy, engaged in the development of resources of great potential value, and in each the wisdom and justice of representative government is being tested as never before by the complex problems growing out of the power and influence of corporate wealth.

The people of these two countries who are attempting to solve these problems are singularly alike. Individually, I know of no one more entitled to the world's admiration than the American, for his optimism, his self-reliance, his energy, capacity and friendly, humane spirit. In the three first he is supreme.

Colonies in Australia has there as yet been such triumph over obstacles as has been shown in America in the creation of cities like Denver and Cheyenne, or in industrial progress.

The struggle for wealth and for material development in Australia is far less keen than in America, and its achievements have not been along these lines; but in dealing with questions involving the general welfare, in holding the scales even between the rights of men and money, and in forecasting the requirements of future generations, Australia has shown a distinct superiority over America. Its social and industrial legislation has, by its humanity and its success, made Australia a hope and inspiration to all English-speaking countries.

Australia began earlier and has done far more toward solving the problems of the proper management of public utilities, and the adequate conservation of natural resources than America. Much of the American legislation on these matters in the last fifty years has been sordid, short-sighted, selfish; that of Australia has been, as a rule, enlightened and economically sound.

In the United States we have left the ownership and operation of public utilities largely to private enterprise, which, as a rule, operates them for the benefit of the owners, and not for the benefit of the public. In Australia public utilities are, as a rule, owned and operated by the public. The State of Victoria owns and operates its railroads; the Federal Government owns and operates the postal service, the telegraph, telephone and the parcels post. Transportation of intelligence, of people and of goods are therefore all controlled by governmental agencies. What has been the result? There can be only one answer: the people are more fairly and cheaply served than by the privately owned systems in the United States.

The evils of secret rebates, the discrimination between cities, which build up one part of the country and hold back another, which enrich one individual and impoverish his neighbor—which have formed such an exasperating feature of American railroad history—are unknown. There is not a city in Australia which requires a George Kindel to fight the battle for its commercial existence, as has been necessary in Denver and many other American cities.

In the cheapness of their construction and efficiency of operation American railways equal those of any country, and probably surpass those of Australia. That is not what I am considering. I am dealing with the way the public is served and the price it pays for the service, and that railways owned by the state are better for the public than equally effectively operated roads privately owned, is shown by the fact that the people of Australia are contented, while the people of the United States are in revolt. I have been told by those who are in a position to know, that the state-owned railways of Victoria could be sold for double their cost. But I am sure not 5,000 votes out of half a million would favor a sale on these terms. The people would no more approve turning these state-owned railways over to private management than the people of Colorado would approve making the public highways toll roads.

Each Australian State owns its public lands and the conservation of natural resources is a matter of State rather than Federal legislation. Lands at first were regarded as of little value and were given away with a mistaken generosity which the State is now endeavoring to correct thru the repurchase and subdivision of estates and thru the imposition of a graduated land tax, which will promote subdivision of land by its owners. The later management of Victorian lands has been more enlightened. The State is dotted with forest reserves, such reservations having been a part of its public policy for many years. The State gives no perpetual title to mineral lands, but permits mining under leases, renewing these leases as long as work continues, or a satisfactory reason for stopping exists. This has not retarded development, but it has prevented the speculative acquirement of mineral reserves and left the undeveloped country in the hands of the public, its proper custodian.

If the State of Victoria has not developed any new policies in the management of lands, it has shown foresight and wisdom in dealing with rights to water. It has recognized, as few countries have done, the constantly increas-

ing importance of water to the life and comfort of man. No economic fact is of more significance. Every increase of population and advance in civilization multiplies both the extensive and intensive uses of water, and makes more imperative the need for the public conservation and control of the supply.

The recent improvements in the transmission of electrical power have augmented the value of flowing water to an extent which can scarcely be stated in percentages. Formerly the factory had to go to the stream. Now the energy of the stream is transported cheaply and with small loss to distant cities, to light and heat their homes and turn the myriad wheels of industry. The utilization of water-power in many countries is being made an effective agency for promoting the well-being of the people and for the development of local industries, and if rightly managed it can be made a permanent factor in creating better conditions of life. Victoria has recognized this and is so managing its public water supplies as to preserve for future generations the full benefits which may come from them. No perpetual rights to water for any use are granted, only licenses to use are issued, and the longest term of any license is fifteen years.

This effective public control of water supplies has been simplified by retaining in public ownership not only the water itself, but the land thru which streams flow, including a strip of land on each bank, from one to three chains wide. The State is therefore the sole riparian proprietor. Owning the land on each margin of the stream, it is in a position to say who shall place pumps on the banks, build dams to utilize their power or cut channels to divert their waters. No one can take water from an Australian stream without paying for it. The charges for this service are nominal, the intention being simply to secure enough revenue to pay the expenses of supervision and of dividing water fairly in times of scarcity.

The Victorian system is enabling the State to locate the places where water is to be diverted and used so as to secure the largest returns. Development there is going on according to a prearranged and systematic plan. This control over the location of works and the charging for the water used has also an important educational influence; it makes the doctrine of public ownership perfectly intelligible to the most simple and selfish minds. The thing which I keep asking myself is: Why could not the American States have adopted a plan of this kind? Why is it that a self-governing people, so intelligent in their own affairs, should have, in their public capacity, permitted the chaotic and meaningless methods which have been followed in Colorado and other States in acquiring titles to water, to be adopted? Why should not the State have determined where water should be diverted, instead of leaving it wholly to individual inclination and interest? Why should not some disinterested public official have determined the amount of water used, and the right acquired by that use, by actual measurement, instead of adopting the costly and cumbersome proceeding in courts, under which titles have been acquired for ditches that were not built, and for far more water than the stream ever carried? And why should the rights be made perpetual, when development could be secured without it?

No one can seriously consider this matter without seeing that the prodigal granting away of these valuable resources is taking away from the future dwellers in this region one of its greatest natural advantages.

The weakness of American legislation is that our people think solely of the present and of what each individual can get out of the country. We need to change this. We have a duty to our successors: To transmit to them some of the opportunities we have enjoyed, and if this generation is not capable of developing our resources so that the public may enjoy the benefits, ought we not to so limit rights in those resources as to permit this being done in the future? The wisest countries of the world are not selling their mines, they are leasing them, and no enlightened country gives away rights in perpetuity.

The cascades which tumble down the rocky slopes of the Colorado mountains ought to belong forever to the people, and as far as possible the public should enjoy the benefits which come from them. But if the present policy of granting perpetual rights is continued,

only one result can follow: These power privileges will pass into the hands of a few, just as other resources passed into the hands of trusts, and instead of the people of the State securing light and heat and power at what it costs to generate it from our waterfalls, they will have to pay what it costs to generate a competing power from coal, and instead of these mountains benefiting the people who live in them, they will simply serve to increase the dividends on stocks and bonds held in distant cities.

The great lesson of Australia to America is not, however, that the State can own and operate a railway system, or can conserve its resources in mines and streams, but that the people have learned that they can act together wisely and efficiently in carrying out great works for the common good, and that, in the development and use of their resources, it is the welfare of the many, rather than the enrichment of the few, which is the governing principle.

This country has led the world in its ability to carry out monumental enterprises for private gain. But if it is to continue in the future what it has been in the past, the *land of opportunity for the multitude*, we must enlist this efficiency and capacity in the service of the public. Unless this is done, the aggregation of our resources in a few hands must continue. It will become a country where a few men will possess great wealth and power, with the nation itself largely serving them and dominated by them, while the crown of democracy and an opportunity for the common man will pass from the republic on the eastern shore of the Pacific to the commonwealth on its western shore.

VICTORIA, AUSTRALIA.

# "Motoring for People of Moderate Means"

BY R. P. GETTYS

UNDER the above caption Mr. W. F. Dix writes in THE INDEPENDENT of April 13. One concludes, after reading Mr. Dix, that people of moderate means can own a car. We hardly know what is meant by "Moderate Means." Will leave that for Mr. Dix to answer.

I owned the first car that was brought to our town, eight years ago, and have watched developments with a great deal of interest and have done no little work in the accumulation of data as to costs in all their details of up-keep, gasoline, oils and everything pertaining to the car. The following table of figures is based on actual use and confirmed by questioning many owners of cars. We will take a car costing say $2,000, as the most economical one, and figure on a yearly run of 8,000 miles—viz.:

| | |
|---|---|
| Interest on investment | $120.00 |
| Depreciation 25% | 500.00 |
| Tires and tubes (for 8,000 miles) | 300.00 |
| Thirteen miles to the gal. of gasoline at 15c per gallon | 100.00 |
| Lubricating oils and grease | 50.00 |
| Casualty and fire insurance | 110.00 |
| Garage, $10.00 per month | $120.00 |
| Up-keep and incidentals | 120.00 |
| One-half wages of "house boy" as chauffeur | 180.00 |
| Total annual cost | $1,600.00 |

Average cost per mile, twenty cents.

Now where is the man with "moderate means" that can stand this? It is true that hundreds of them are in the possession of men of "moderate means," and they go dashing up and down our streets at a break-neck speed, regardless of costs or danger to themselves and others.

By cutting down grocers' bills, reducing rents, cutting out life insurances, wife wearing cheaper bonnets, keeping John from college and Mary from boarding school, this can be kept up for awhile, but the strain cannot last long, and he will have to go back to the livery stable or more likely "Shank's mare," unless his shanks have been knocked out of place by reckless driving, and leave the car as a "toy for the rich only."

My figures and remarks are based on cars for "joy riding" only. For the physician or business man they do not apply.

KNOXVILLE, TENN.

# Literature

## Life of Cecil Rhodes

THERE has not yet been time since Cecil Rhodes passed from the stage to form the historic estimate of his character and influence on the development of the British Empire. Elements of greatness there surely were in his nature; but whether he will finally find his place among statesmen or among politicians; among empire-builders or among buccaneers; among the promoters of civilization or among the enemies of true progress, can only be determined after many more years have passed over his work than have elapsed since his death in 1902. Sir Lewis Michell in his biography* makes no attempt to weigh impartially the merits of his hero. He states, at the outset, that his intention is to "portray the real man as he appeared to his personal friends and to his political opponents"; but affection and admiration—amounting almost to hero-worship—color the picture. Sir Lewis Michell can hardly be trusted to treat fairly those who differed in opinion and policy from Rhodes. He is ready with a sneer at the mention of men such as the Rev. John Mackenzie, Mr. Labouchere, and even Mr. Gladstone, when their ideas of native rights, or of colonial management, differed from those of Rhodes. As executor and trustee of Rhodes, Sir Lewis Michell has had access to all his papers, private and official, and he gives in these two volumes much of the actual sayings and writings of Rhodes, along with an account of his work which frequently becomes little more than a chronicle of events. To this material Sir Lewis Michell adds a copy of the Rhodesian Charter and more important still, as a revelation of character, a verbatim copy of that most remarkable historic document the last will and testament of Cecil Rhodes. All this is first-hand material from which the reader is able to form his own estimate of the man who added an immense state to the British Empire and who, while occupying the responsible position of Prime Minister of a self-governing British colony, risked embroiling his country in war by allowing a hostile expedition to be organized under his eye, and to carry war into a neighboring country with which Great Britain had no open quarrel.

The most contentious events in Cecil Rhodes's career—what was termed in England his attempt to buy the Liberal party in 1891, and his connection with the Jameson Raid of 1895-6—are both treated frankly and fully by Sir Lewis Michell. The English election incident is perhaps the most illuminating so far as concerns the light thrown on Rhodes's character. In his correspondence with Mr. Schnadhorst, the Liberal party manager, over the donation of £5,000 to Liberal campaign funds, as later in his will, Rhodes showed a naive belief that by the use of a little of his money he could control the course of events and make history flow in the channels he had marked out. In sending the subscription to Mr. Schnadhorst, Rhodes made two stipulations—first, that the Irish Home Rule bill should provide for Irish representation at Westminster, and, second, that the English should not evacuate Egypt. If either of these conditions should be violated, the money was to be returned or devoted to some charity. Irish representation at Westminster was embodied in the Home Rule bill of 1893, and the English have not yet evacuated Egypt; but it would be somewhat humiliating to the pride of British statesmen if it had to be acknowledged that the money of Cecil Rhodes—a paltry £5,000—had controlled British policies in these two matters. It was nevertheless Rhodes's opinion that by making this subscription he was ensuring the adherence of the Liberal Government to the lines of policy he had mapped out for it.

The same faith in his opinions and theories, and the same determination to rivet them on the world by means of his

*THE LIFE AND TIMES OF THE RIGHT HON. CECIL JOHN RHODES, 1853-1902. By the Hon. Sir Lewis Michell. New York: Macmillan Company. 2 vols. 8vo, pp. xxiv, 437; x, 450.

money, are visible in the last will of Cecil Rhodes. This remarkable document runs to twenty-six of Sir Lewis Michell's pages. The best known clauses of this will are those relating to the foundation of the Rhodes scholarships, and the conditions — especially the twice-repeated condition that "the students who shall be elected shall not be merely bookworms" —under which these scholarships are to be enjoyed. But quite as interesting as revelations of the character of their author, are the clauses relating to the Suffolk estate of Dalham Hall, which he bequeathed to his brother with the intention of founding a territorial family in England. This estate he entailed to the full limit of the English law. Then follow the clauses explaining his intentions:

"Whereas I feel that it is the essence of a proper life that every man should during some substantial period thereof have some definite occupation and I object to an expectant heir developing into what I call a loafer. And whereas the rental of Dalham Hall estate is not more than sufficient for the maintenance of the estate, and my experience is that one of the things making for the strength of England is the ownership of country estates which could maintain the dignity and comfort of the head of the family, but that this position has been absolutely ruined by the practice of creating charges upon the estates either for younger children or for the payment of debts, whereby the estates become insufficient to maintain the head of the family in dignity and comfort. And whereas I humbly believe that one of the secrets of England's strength has been the existence of the class termed the country landlords who devote their efforts towards the maintenance of those on their property. And whereas this is my own experience."

The will then proceeded to direct that if the life tenant of the estate attempted to assign any charge, or to incumber his interest in any manner, he was to forfeit all right to the estate. It also provided that no heir could inherit unless he had either been engaged consecutively for ten years in some profession or business or within one year after reaching the age of twenty-one he should engage in some profession or business and so continue for ten years; and also that if the profession were neither the army nor navy, the heir to the estate must become a member of some militia or volunteer corps.

This attempt of Rhodes to found a family in his brother's line, and to fasten upon at least one corner of England in perpetuity a perfected example of what in his opinion an English territorial family ought to be, has yet to stand the test of time. It is evidently out of harmony with the present tendency of the English people to revolt against the massing of land in great estates, and the perpetuation of feudalism in the persons of the great land-owners. But Cecil Rhodes—altho he strongly asserted the right of every civilized man in South Africa—black or white—to the exercise of the franchise—was at heart no democrat. He was too autocratic, too eager for short cuts to dominion, to wealth, and to civilization, to be content with the slow, blundering, but secure progress of democracy.

*

**The Jews:** A Study of Race and Environment. By Maurice Fishberg. New York: Charles Scribner's Sons. $1.50.

We are indebted to Dr. Fishberg for the great mass of information he has gathered in this volume and for his interesting discussion of the Jew from the point of view of race purity and the effect of environment as the Jew has passed thru one period, one country and one set of experiences after another. He gives ample elaboration of the thesis that the Jews are not a pure race. He goes further and adduces testimony to the effect that not only has there been considerable intermixture of blood, but that the heterogeneity of characteristics is such as to invalidate the usual claims to separate nationality for the Jewish people. Thus he says:

"We have found no differences between Jews and Christians which can justly be attributed to racial causes, and which depend solely on hereditary transmission, unaffected by the environment—Religion, the Jewish, as well as the Christian and Mohammedan, with the assistance of the State, artificially created the type of the Jew of the beginning of the nineteenth century. There is nothing unusual in the fact that an isolated community should evolve peculiar characteristics. As a matter of fact, in those countries in which the Church has been separated from the State the type of the Jew has undergone a transformation and approached more or less the type of the people among which he lives. There was nothing in the way of such a transformation

as soon as the barriers placed by religion and the State were removed, because ethnically there are practically no differences between Jews and other Europeans. Both consist of conglomerations of various racial elements blended together in a manner that makes it impossible to disentangle the components, or even the predominant race, out of the ethnic chaos of most nations."

One feels that Dr. Fishberg proves too much. For it is apparent that, tho there is ample evidence of the assimilability of the Jews and that they have many characteristics in common with others, still as we find them scattered over different parts of the globe, they are distinguished as groups with reference to which certain qualities may be predicated.

**The Incas of Peru.** By Sir Clements Markham, K. C. B. With 16 Illustrations and a Map. New York: E. P. Dutton & Co. $3.

Few men have felt a call to investigate an historical mystery at so early an age as fourteen, who continue to feel the charm of the call thru sixty years of a busy life, and hark back to the sound of it at seventy-four. Sir Clements Markham is one of the few. As a naval cadet on board H. M. S. Collingwood he first saw the land of the Incas on the west coast of South America. Seeing it, he was fascinated by it, and began to study the geography and history of it, the polyglot language of its mixed people, the story so wonderfully told by Prescott, of its remarkable princes and the semi-socialistic realm they had built up, to be toppled down by the touch of a few armed knights from Spain. He has translated and printed many records detailing the known life of the coast and the mountain people, and more than hinting at the half known antecedents of that wonderful civilization which utilized gold in its daily activities pretty much as we utilize galvanized nails of iron. Now, after sixty years of research and comparison of the works of many other searchers, he returns to the old fascinating story of the Incas, which he tells with such additions and modifications as sixty years have brought. After much discussion of authorities, columns of statistics and geographical detail, which will interest the student of history, he passes to what will be of most fascination to the general reader, the probable origin of the somewhat patriarchal system which may have been found already in existence, ready to be pulled into shape by a capable hand. He shows how this shaping may have been on the easy lines followed by all pastoral and agricultural peoples; easy, one may say, until the cattle became numerous and the crops tempting; simple, until a certain hierarchical differentiation as to the proper uses of cattle and crops and tempting portions of the agriculturists themselves, brought complexity into the primitive ideas of socialism. Kings then had their turn. Sir Clements does not claim to have been the first to attack the problem of antecedents and conditions. He was "gradually approaching the discovery that Peruvian socialism was not a conception of the Incas, but the result of much more ancient organizations recognized and adopted by the Incas." It was the German sociologist Cunow, in his "Organization of the Empire of the Incas—Investigation into Their Ancient Agrarian Communism," who "has caused a complete revolution in the manner of considering the rule of the Incas." The communistic organization was "anterior to" the Inca monarchy. Communism was the result of the union of the numerous *ayllus*, or "village communities," organized "on the same basis as the village communities of India, and the German mark." This primitive union "collectively held the land under the domination of the most powerful among them." Ancient Peru was not "the archetype of socialism, but a vast agglomeration of village communities." As such it came into the hands of kings to be developed. This view Sir Clements adopts, but, like a true and loyal subject of royal government, he "does not consider that the pre-existence of communities holding land in common at all detracts from the admiration that is due to the government of the Incas."

**The Income Tax.** By Edwin R. A. Seligman. The Macmillan Co. 1911. $3; 701 pp.

In the midst of a discussion torn by political bias and superficial information, Professor Seligman has come forward with a volume upon the history and the-

ory of the income tax which shows the author's usual mastery of essential principles and important details. Its tone is scholarly, judicial and conservative, but the wealth of detail is more than the casual reader would take time to wade thru. Professor Seligman is concerned with presenting a clear exposition of the most important examples of income taxation in existence today; he traces the legislative and literary history of each, analyzes the provisions of the existing law and explains the practical workings of the system. This is done for England, Germany, France, Austria, Italy and Switzerland. American experiences with the income tax are studied in their relation to the peculiar constitutional situation in the United States. The chapter on "The Constitutionality of the Income Tax" is the most interesting chapter in the book. In it Professor Seligman shows that in the famous Pollock cases the Supreme Court of the United States was misled by the counsel into an historical interpretation which was beyond all doubt erroneous. The discussion of the constitutionality of the income tax showing quite conclusively that little is to be hoped for from a Supreme Court whose decisions have been based upon glaring historical errors, Professor Seligman turns his attention to the question of a sixteenth amendment. Here he takes issue with former Governor Hughes. In the last chapter of the book a practicable program is outlined. The three forms of the income tax are discussed. The author maintains that there should be a tax on corporate incomes and a tax on individual incomes secured from corporations. Since the interest on bonds is fixed, the latter tax would not work undue hardship. The salaries of officials and employees of corporations should also be taxed. Business and professional incomes should be taxed, but a differential rate is advisable. Incomes from real estate should be taxed upon the occupier. Incomes from non-corporate securities, chiefly mortgages, should be taxed on the occupier, thus avoiding the shifting of the tax to the borrower in the shape of an increased rate of interest. Professor Seligman finds that thruout democratic countries the best criterion of taxable faculty has been found in income. He therefore argues that the United States is bound to fall in line with the other countries in the near future.

*

**Heroes of California**: The Story of the Founders of the Golden State as Narrated by themselves or Gleaned from other Sources. By George Wharton James. Boston: Little, Brown & Co. $2.

This book is not either biography or history, nor is it by any means fiction. It belongs to that class of biographic essay which makes of its subject a convenient peg on which to hang fact, fancy and vision. Mr. James is scandalized at the local ignorance concerning the heroes of the Golden State, and has undertaken to popularize their stories. As his bibliographical appendix shows, he has read the first book that came to hand for each of the heroes mentioned in his forty-two chapters — Spanish priests, trappers, gold-seekers, scouts, sailors, engineers and scientists. Sometimes his sources have been useful; always they have been fragmentary; wherever possible he has padded his text with quotations in which he appears not to know any difference in value between the actual word of a participant and the writings of Hittell and Bancroft. The volume has some value as a catalog or guide book, but in nearly every chapter it bears witness to the indiscriminate credulity of its writer.

*

**Legal Development in Colonial Massachusetts, 1630-1686.** By Charles J. Hilkey. (In Columbia University Studies in History, Economics and Public Law, Vol. xxxvii, No. 2.) New York: Columbia University Press.

Dr. Hilkey takes exception to the prevailing belief that the English colonists brought the common law to America and relied upon it as their guide and safeguard. He asserts, to the contrary, that tho they brought certain legal practices to which they were accustomed at home, they relied most heavily upon the enactments of the Mosaic law and the statutes of their own Assembly. In some cases, indeed, there was prolonged litigation, as the colonists resisted the application of the common law of intestacy to themselves. The thesis is based upon a careful analysis of the law-making bodies

and the law itself, and adds another to the already strong list of arguments which go to prove that the colonial environment was quite as effective as the traditional rights of Englishmen in building up the New England.

## Literary Notes

....The President has announced Henry Bacon, of New York, to be the choice of the Fine Arts Commission as designer of the Lincoln memorial to be erected, probably in Potomac Park, under the $2,000,000 appropriation authorized by Congress.

....Mr. James Whitcomb Riley's gift to Indianapolis—a $75,000 site for a new public library—speaks equally well for the poet's loyalty toward his home city and for the popularity of his verse. We hope it will not too greatly encourage young dialect-poets.

....Volume XI of the *Publications of the Mississippi Historical Society* (University, Miss.) contains eighteen new contributions to the history of the State. Many of these treat of the reconstruction period. The volume is an excellent example of this kind of publication.

....London has behind it a continuous history of nearly nineteen hundred years, and the tourist is often at a loss as to the most important spots to visit. *An Historical Guide to London,* by G. R. Stirling Taylor (Dutton; $2), gives much historical matter in practical and pleasing form, well illustrated by 56 photographs.

....Anyone who has been in Italy knows the skill of the Italian cook, especially in the preparation of vegetables for the table. *Leaves From Our Tuscan Kitchen,* by Janet Ross (London: J. M. Dent; $1) is a welcome addition to our list of cook-books, as it gives 168 recipes with clear directions for cooking vegetables after the Italian fashion.

....The sculptor Rodin has delivered to the French Government, as a gift of certain of his friends, his statue, *l'Homme qui Marche.* This bronze is now on exhibition at Rome, but after the close of the International Exposition it will be placed in the Court of Honor of the Farnese Palace, where is housed the French Embassy and School.

....Robert D. Benedict, having browsed to his heart's content upon the French chronicles of the fourteenth, fifteenth, sixteenth and seventeenth centuries, has retold some of their more diverting anecdotes and episodes in the little volume published by Badger as *Stories from the Old French Chronicles.* He has done his work simply and effectively.

....William Boyd Carpenter, Bishop of Ripon, has prepared an excellent manual of private prayers and devotions, drawing from more than a hundred authors ranging from St. Augustine to Dr. J. H. Jowett. The volume is appropriately bound and published under the title of *The Communion of Prayer* (Philadelphia: G. W. Jacobs & Co.)

....Prof. W. J. McGlothlin of the Southern Baptist Theological Seminary has performed a valuable service for those interested in the growth of Christian doctrine by bringing together in his *Baptist Confessions of Faith* (Am. Bap. Pub. Society; $2.50), all the important creedal statements of his denomination from their beginnings in 1527 down to the present time.

....Longmans, Green, & Co. are the publishers of "Harvard Historical Studies" and from them we receive *The Public Life of Joseph Dudley: A Study of the Colonial Policy of the Stuarts in New England (1660-1715.)* The author is Dr. Everett Kimball, and his monograph has distinct value for the student of our colonial history in the period between settlement and revolution ($2).

....The first vote taken by the French Academy on the award of the new 10,000 franc prize, to be offered annually for the best novel of the year, resulted in no choice. Charles Péguy, Louis de Robert, Romain Rolland, Henry Bordeaux, Colette Yver, Francis James, Pierre Mille and Paul Adam divided the votes of the twenty-eight members in attendance on the four ballots taken. The academy succeeded, however, in awarding to the first of these novelists—Charles Péguy—the Prix Estrade-Delcros, 8,000 francs. To Louis Bertrand was awarded the Prix Alfred-Née (3,500 francs). This prize goes to M. Bertrand as author of the *Livre de la Méditerranée.* The Prix Vitet, 2,500 francs, goes to Colonel Barattier, author of *A travers l'Afrique,* and the Prix Narcisse-Michaut (2,000 francs) to Paul Renaudin, author of *Ce qui demeure.*

....It is the fashion nowadays to turn old books into new ones. So it is with Laboulaye's "Abdallah," from the French of which Walter Taylor Field has "adapted" his *Quest of the Four-Leaved Clover,* a tale of Arabia. Ginn & Co. make a most attractive little volume of this (40 cents). It is destined to prove of usefulness as a supplementary reader in the sixth to the eighth grades and should also give pleasure to the children who read it out of school.

....*John Dennis* is remembered because he was Dryden's contemporary, and, to his cost, Swift's and Pope's. His career was long and active, and Dr. H. G. Paul has made *His Life*

and Critics, the subject of a monograph (Columbia University Press; Lemcke & Buechner, Agents, $1.25). Dennis was by no means the fool that some who know nothing of his work may represent. He was least foolish as critic. Dr. Paul's account of him is a laborious, conscientious and uninspired exercise in the literary history of seventeenth century England.

....Holt is the publisher of Francis Storr's *Half a Hundred Tales*. The classical stories are not, for the most part, retold by Mr. Storr, but chosen from the narratives of Hawthorne and less famous authors, not forgetting Bulfinch. The line illustrations here are by Franck C. Papé. It is a volume of evident merit. We also receive a new and enlarged edition of Dr. Charles Mills Gayley's *Classic Myths in English Literature and Art* (Ginn; $1.60); a book too well known to need either introduction or the high praise which it would otherwise deserve.

....Some weeks ago we noticed the issue of "Classical Rome" in the series of Grant Allen's Historical Guides (Holt; $1.35), and now, in uniform format (a most convenient one for traveler's hand or pocket) we have *Christian Rome*, by J. W. and A. M. Cruickshank. It is an excellent guide for one who wants more detailed information than Baedeker affords, and so is its companion volume in this series, the Grant Allan *Florence*, revised by the same travelers.

....A scholarly and comprehensive treatise on *The Christian Doctrine of Man* (imported by Scribners; $2.25) comes from the pen of Mr. H. Wheeler Robinson, tutor in Rawdon College. Beginning with a consideration of the psychological terms of the Old Testament wherein he finds later conceptions taking form, the author traces the development of anthropological ideas thru New Testament and Christian history, and shows their relations to modern thought. Of special value is the discussion of the transformation wrought in doctrinal forms by the growth of science, philosophy and sociology.

....It is difficult to prepare a book really likely to prove helpful as a literary guide to the professional man of letters, and almost equally difficult for the reviewer to welcome any such attempt with real enthusiasm. Prof. Frederic Taber Cooper's papers on *The Craftsmanship of Writing* were originally read as lectures in connection with the University Extension System at Columbia University. Subsequently they were printed in a monthly magazine. They are now published by Dodd, Mead & Co. ($1.20). Professor Cooper is an intelligent and discreet adviser, but we know of no effective school of literature except the laboratory of experience.

The old injunction to "know thyself" is continually receiving new application to the possibilities of self-development. Mr. Stanton Davis Kirkham makes some wise and interesting observations along this line in his new book on *Resources; An Interpretation of the Well Rounded Life* (Putnam). The author's brisk way of hitting at human foibles and suggesting commonsense measures is well illustrated in his declaration that

"the race, after having been cupped, bled, blistered, saturated with calomel and boneset and its appendix removed, is now coming to the conclusion that if it will keep clean, avoid over-eating, and take normal exercise and sleep, Nature will perhaps take care of herself."

....*The Subjection of Women*, by John Stuart Mill, published in 1869, has been brought out in a new edition (Stokes, New York; 50 cents) with a foreword by Carrie Chapman Catt. Very little, if any, of its argument has become antiquated in over forty years since it was written, and it carries a message from one of the clearest minds of the nineteenth century, to the social reformers of the twentieth, enforced by keen analysis, relentless logic and reasonable exposition of the principles of justice which ought to underlie all laws affecting the status of woman.

....The study of Christian sociology has been introduced into some of the theological seminaries with praiseworthy results, and the need of the discipline in preparation for the work of the ministry is felt and recognized more and more. To those who are not favored with academic training in this respect, and to a wider circle of intelligent readers *The Social Engineer* (Eaton & Mains; $1.50), by Prof. Edwin L. Earp, of Drew Theological Seminary, will prove of great value in showing the nature and possibilities of leadership in social activities on the part of ministers and other religious workers. The book abounds in helpful suggestions made in simple terms and enforced by many a homely illustration.

....In his preface to *Three Plays by Brieux* (Brentano), George Bernard Shaw tells us that the Frenchman is the most important dramatist west of Russia. In that kind of comedy which is not an entertainment alone, but a history and criticism of contemporary morals, he is the greatest French playwright since Molière. Mr. Shaw realizes that this is not the view of the French criticis. He does not care, for Paris is

"easily the most prejudiced, old fashioned, obsolete-minded city in the west of Europe."

Brieux is, perhaps, even greater than Molière: for the latter "never indicted society," but only "destroyed the prestige of those conspiracies against society which we call the professions."

....In Thackeray's account of a Channel crossing, from Dover to Paris, 1830, he represents himself as accosted by a French porter, in these eloquent words:

"Sare, eef you af no 'otel, I sall recommend you, milor, to ze Otel Betfort, in ze quay, sare, close to the bathing machines and custom ha-oose. Good bets and fine garten, sare, in French or English style. I am the commissionnaire, sare, and vill see to your [illegible]."

In reproducing the narrative in a recent issue, the *Annales politiques et littéraires* explains that this is *l'anglais tel que le parle* the French hotel servant, and translates "good bets and fine garten" *bons lits et carte excellente.* This is, we suppose, *l'anglais tel qu' on le traduit.*

.. .The French lecturer at Columbia University, during the coming year, is to be Professor Gustave Lanson, bibliographer and literary historian. His subject is the development of the philosophical spirit in French literature during the eighteenth century, and his first lecture will be delivered October 2. Another Sorbonne professor, M. Charles Diehl, is to represent France at Harvard, and will sail for Boston early in October. He will offer three lectures each week, two of them being for students only, and on the subject of Byzantine civilization, while the public lectures will be on the expansion of France in the Orient during the Middle Ages. He will also deliver a series of eight lectures in Boston at the Lowell Institute on the Byzantine cities and their art, Ravennes, Constantinople, Palermo, etc.

....Says Prof. Kuno Meyer, in the introduction to his *Selections from Ancient Irish Poetry* (Dutton; $1.25):

[illegible] literatures of Western Europe, and that in its origins and development it affords a most fascinating study. Whatever may be its intrinsic merit, its importance [illegible]

This intrinsic merit is none too well reflected in his translations, which are decidedly rough. It is in nature poetry that the Gael is, perhaps, on surest ground—at any rate, he [illegible] derfully early upon this ground.

[illegible] take an artistic hint; they avoid the obvious and the [illegible]

Not nature poetry alone is represented here, nor that and poetry of heroism. The cynic will delight in the last of the translations, "From the Instructions of King Cormac."

....*The Early Letters of Marcus Dods, D. D.* (Hodder & Stoughton), the late principal of New College, Edinburgh, are selected and edited by his son, who gives a short sketch of his father's life in the introduction. While a few of the letters were written during Dr. Dods's university career, the bulk of them [illegible] when the young graduate was serving as assistant to various ministers and looking for a pulpit of his own. The devoted affection for his sister Marcia, to whom many of the letters are addressed, lights up these discouraging six years with a glow and warmth which make their history worth recording in this autobiographical form. Both the style and content of the letters foretell the solid development and confident strength of later years.

## Pebbles

Into my smiling rosebud mouth
The smiling barber deftly hooks
His finger, and pulls it awry
To get the whiskers in the nooks
At either corner, and he asks—
And gives my head a scratch or two—
"Your head is very dirty, don't
You think you need a nice shampoo?"

Then he says: "You need a massage."
But I insist that I do not!
And then he blisters my poor face
Within a towel reeking hot;
Then he insists I ought to have
A mess of tonic on my hair!
And that is why I hate to sit
Me in a barber's easy chair.

And all the while the barber breathes
His onion breath into my face,
And hooks his finger 'neath my lip
And drags my mouth all out of place.
A bootblack fumbles at my feet,
And begs and begs me with a whine
To loosen up and come across
And let him give my shoes a shine.

—*Houston Post.*

Odd, isn't it, that one can carry a mortgage and yet not be able to lift it; that a man can be calm and collected at his wedding, and yet lose control of himself?—*Boston Transcript.*

"Is your husband in favor of initiative and referendum?"

"Yes," replied the woman in the sun-bonnet; "and the recall and local option and anything that 'll enable him to go to the polls and miss a day's work."—*Washington Star.*

"So you have had a long siege of nervous prostration?" we say to the haggard author. "What caused it? Overwork?"

"In a way, yes," he answers weakly. "I tried to do a novel with a Robert W. Chambers hero and a Mary E. Wilkins heroine"—*Life.*

The American opinion of English coffee is not exalted. A visitor from across the herring pond sat down to breakfast in a London boarding establishment. The landlady came bustling in with the coffee pot. "It looks like rain," said she, by way of making conversation. "Yes," said he, sniffing, "but it smells something like coffee, anyway."—*London Chronicle.*

# The Independent

Entered at New York Post Office as Second Class Matter

Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## The Steel Investigation

It may be inferred from the remarks and questions of majority members of the committee now making an investigation concerning the Steel Corporation or Steel Trust, that some of them believe the panic of 1907 was deliberately caused by certain moneyed interests to serve their selfish purposes. That part of the inquiry—and it is a large part—which relates to the acquisition of the Tennessee Coal and Iron Company by the Corporation in the first week of November, 1907, has shown that this theory is regarded in the committee with some favor, altho those who are really familiar with the history of the panic know that it deserves no consideration whatever. Mr. Roosevelt's recent testimony as to that transaction has been read with interest. Like much of the other testimony, however, there was little in it that was new.

The truth is that in the early days of the panic several speculators of considerable prominence, some of them connected with the steel industry, were carrying a large part of the Tennessee Company's capital stock, having had in mind a merger with another company or some other profitable disposition of it. Thru the agency of a well-known brokerage firm this stock had been placed in banks and trust companies as security for loans which were maturing. The market price of the shares was falling; the lending institutions wanted their money and could not get it. There was danger that two or three of them, with the brokerage firm, would fail. The stock, carrying control of the company, was offered to capitalists identified with the Steel Corporation, who did not greatly desire to buy. They had had an opportunity, before the panic, to take it. Realizing, however, that the severity of the panic and their own losses would be increased if the desired relief should be withheld, they consented to purchase the shares if prosecution for violation of the Anti-Trust law could be avoided.

Two of them went to Washington and laid the case before President Roosevelt, who assured them that he would not "interpose any objection." He virtually promised that they should not be prosecuted for thus enlarging (from 58 to 62 per cent.) the Corporation's share of the steel industry. There is an attempt now to show that the panic had been manufactured; that there had been a conspiracy to embarrass the owners of the stock, in order that they might be compelled to part with it, and that Mr. Roosevelt was misled by the reports given to him.

We believe that Mr. Roosevelt was moved by a sense of duty to the people, but his recent testimony proves that he was not then, and is not now, well informed as to the nature and course of the panic. "The result," he says, "justified my judgment. The panic was stopped." But it was not stopped, on or about November 4, 1907. The capitalists who came to see him told him "they knew of no other way by which the panic could be stopped." This sale, he adds, "offered the only chance of arresting" it. The "damage threatened was incalculable," and he sought to "prevent appalling disaster." As we have said, and as almost everybody knows, the panic did not end on November 4, a few days after the beginning of it. The relief given by the sale of the Tennessee Company undoubtedly had a good effect.

but if the sale had not been made we think the additional failures would have been limited to those of the involved brokerage firm, one trust company and one bank. Of course, no one can be sure that other institutions would not have been shaken, but it seems to us that the severity of the panic would not have been very greatly increased.

We are confident, however, that Mr. Roosevelt believed an "appalling disaster" was impending. But we cannot admit that the panic was "stopped" by his action. Opinions of good men differ as to his duty at the time. His decision was judicial in character. He felt that the emergency was an extraordinary one, and that he could rightly take no other course.

The inquiry has drawn interesting suggestions from men representing great companies. Some time ago, Judge Gary, the head of the Steel Corporation, said in his testimony that he would be pleased if there should be some authority at Washington to tell him what his company could do, and even to regulate prices. A few days later, Attorney-General Wickersham, in a public address, spoke in favor of the appointment of a commission empowered to supervise and regulate great corporations engaged in interstate business, as the railroads are now regulated by the Interstate Commerce Commission. Mr. Perkins, formerly of the firm of J. P. Morgan & Co., and influential in the management of the Steel Corporation, said to the investigating committee last Saturday:

"I believe the mere question of 'limelight' an important thing. Publicity, I firmly think, would eradicate many of our troubles. If we had a law providing that a corporation engaged in interstate business could register itself with a bureau here in Washington, submitting its prices, its balance sheets, its methods, its treatment of labor, etc., and if these reports should be published, thus gaining the confidence of the public in the corporation's securities, the confidence of the competitor that he was being fairly treated, and the confidence of the consumer that he was being fairly dealt with, I think that very soon all corporations would register themselves and that we should have publicity which would go a long way toward removing the evils of our great companies and preserving the good that already is embodied in them."

It has been decided that there shall be hearings, beginning on November 15, before the Senate Committee on Interstate Commerce, concerning Mr. Newlands's bill for a trade commission and other projects for the regulation of industrial corporations. At the meeting of the Steel Investigating Committee, on Saturday last, it was made known that steps are to be taken by the House for a wide inquiry as to corporations, industrial conditions and the Sherman act.

There should be a national commission, empowered to regulate great industrial or manufacturing corporations engaged in interstate trade, and to insure such publicity as Mr. Perkins desires. We expect that Congress in the near future will provide for such a commission.

## To the Senate

GENTLEMEN: The President of the United States, acting under the Constitution, has submitted to you for ratification two treaties of peace and friendship with Great Britain and France. These treaties are for the unlimited arbitration of all disputes, even those supposed to involve "national honor," and are generally held to be the farthest steps yet taken in the history of the world toward the goal of universal peace.

It is reported from Washington that you will not ratify these treaties at the present session, that you fear that your rights as an integral part of the treaty-making branch of the Government have been invaded. Your Committee on Foreign Relations has even made the great blunder of reporting the treaties back to you emasculated of a most important provision—the provision which enables the commission of inquiry to send a dispute to arbitration.

It is, of course, your sworn duty to examine the treaties with all care to see that the interests of the people of the United States, as well as your own prerogatives, are properly safeguarded. There can be no objection to your taking all the time you need to make the minutest scrutiny.

But we warn you that the country is in no mood to stand any unnecessary quibblings over Senatorial precedences,

You will be held individually and collectively responsible if you attempt to put your dignity above the cause of the world's peace. Do not forget that since you defeated the Olney-Pauncefote treaty of 1897 and the Hay-Pauncefote treaty of 1903 a well-nigh universal sentiment for peace and arbitration has grown up in this country and thruout the world. The churches, the chambers of commerce and boards of trade, the labor unions, the universities, and indeed all interests and classes in the community are now a unit in this noble and irresistible movement. Even the great mass of the plain people are at last coming to realize who are the ones who undergo the sufferings of war and pay the taxes of armed peace.

We have the honor to present to you this week the views of Prof. John B. Moore, generally considered the greatest international lawyer in America. He thinks the treaties should be ratified. And President Taft himself, in his speech last week at Mountain Lake Park, answered in brief all constitutional objections that you can reasonably make. Said he:

"By this treaty, if it is ratified, the Executive and Senate representing the United States, agree to settle all their differences, as described in the treaty, by arbitration or thru a commission.

"Should the treaty be ratified, the Senate, exactly as the Executive, will be in honor bound by its obligations in good faith to perform the offices which the main treaty provides shall be performed on the side of the United States, and then to abide the result, and to acquiesce, or, in so far as may be, perform and execute the judgment of the tribunal.

"What is there to prevent the Senate from uniting with the Executive in agreeing to settle future controversies of a given description in a treaty by the judgment of an impartial tribunal, and to submit to that tribunal not only the question how the issue ought to be decided, but also as a condition precedent whether the issue is within the terms of the treaty already made?"

If you are willing and have the right to sanction the arbitration of questions that involve the national honor, as you did in the famous Alabama case or the recent Newfoundland fisheries case, there can be no possible constitutional reason why you cannot agree to give your sanction to arbitrate *all* such *cases in the future*. There is no constitutional difference between making a special and a general treaty.

Thus the only question before you is this: Is the United States ready yet to arbitrate all disputes that may arise between herself and England and France? Mr. Taft and Mr. Knox say yes, our leaders of thought and action say yes, the whole country says yes.

A golden opportunity, therefore, lies before you. The imperishable honor of leading with President Taft in the movement for the abolition of what Thomas Jefferson called "the greatest scourge of mankind" is within your grasp. Unlimited arbitration is the beginning of the end of war.

Let the treaties, therefore, be ratified at the present session. The moral and material benefits which will accrue to our nation and to all mankind for this leadership in the cause of the ages will be beyond human computation.

## For Justice to the Weak

Our Government is now seeking earnestly, by broad treaties with the great nations of the Old World, to promote a peaceful settlement, by arbitration or otherwise, of all international controversies, even those involving a nation's honor. Its treaties with Great Britain and France have been signed. It desires to make similar agreements with other nations, and is committed to support of the principle that all disputes between one nation and another should be adjusted, if a trial cannot be avoided, by the decision of an international court. The nations of the Old World to which it has proposed these comprehensive treaties are strong.

At the same time a weak nation in the New World accuses the United States—as it has continuously accused this country since November, 1903—of deliberate violation of a treaty, of intentional disregard for accepted principles of international law and procedure, of injustice, of robbery. And our Government has continued to ignore the charge, even after public admission of the justice of it by him in obedience to whose orders, which were those of the President of the United

States, the action complained of was taken. Nearly five months have passed since Mr. Roosevelt, complacently contrasting his methods with those of more sensitive and judicious statesmen, said: "I took the Isthmus."

We asked Mr. Henry G. Granger, formerly consular agent of the United States at the capital of Colombia, to make a careful study of the relation of the United States to the secession of Panama. He was already familiar with the record, with the condition of public sentiment in Colombia as to the question, and with diplomatic procedure. We publish today the results of his inquiry. We direct the attention of our readers to them and ask for a careful consideration of the facts and his conclusions.

This controversy should be ended without delay. In response to the respectful but persistent protest of Colombia we should promptly provide for a settlement by diplomatic negotiation or by arbitration. We should either consent to join Colombia in laying the whole matter before the Hague tribunal, or should make a fair payment. In either case we should seek what may be called a quit-claim deed. This course is demanded in the interest of consistency, because of our present attitude toward the peaceful adjustment of all such disputes by arbitration or otherwise. And we should be as unselfish with respect to Colombia as we have been in Cuba or in Mexico. Justice, in our opinion, demands such a course, and this demand should precede that of consistency. We should take this course to promote our good repute in South America, and in the interest of our trade with South American countries. It is quite probable, as one well-informed man has said, that this "taking" of the Isthmus has lost for us more in trade than the cost of the canal. The evidence, it seems to us, if laid before the Hague court, would compel a decision against the United States and the award of a large sum in damages. If this be the opinion of our President and our Congress, why should not the United States admit the injustice and provide for a fair payment in cash? At all events we should seek peaceful and just settlement of international controversies with the weak as well as with the strong.

## The British Constitutional Victory

THE House of Lords has succumbed, submitted and is defeated; the House of Commons has asserted, made its demands and has conquered. The result is what it should be, the victory of the people over ancient hereditary right, which was wrong.

Like that of the United States, the Constitution of Great Britain provides for a bicameral legislature. But our Upper House is elective, while that of Great Britain is hereditary. Ours is a pyramid on its base; that of Great Britain is a pyramid on its apex—it topples when the earth shakes, and it has been shaking heavily these last five years.

The House of Lords has resisted to the limit the abolition of its right to veto the will of the Commons. What it means for them to yield we may in a measure understand from the resistance which our own Senate makes to any apparent lessening of its right to make a treaty. No one doubts the righteousness of the arbitration treaties negotiated with Great Britain and France; but we all fear the Senate, not that the Senate does not believe in arbitration, but because it suspects a loss of its dignity in the case of future disagreements. This is a small matter, but that of the House of Lords is a much greater matter. It is as if our House of Representatives could enact a law, after two years' delay, in spite of all the Senate might do. We would not and could not allow such an indignity to the Senate, because the Senate represents the people, the same people as does the lower house, altho in a different way; but in Great Britain the House of Lords is composed of a few hundred men who represent, not the people, but their own fathers and grandfathers, a club of rich men with handles to their names.

It is a revolution, but a revolution only in part achieved as yet. The House of Lords can, it is true, postpone for two or three years the will of the people, but it is itself unreformed. That will come, but the Liberal Government is in no desperate hurry to accomplish it. To do it now would not be to do it thoroly. Perhaps it cannot be done thoroly for

years, but to do it in haste would be to strengthen the Lords on their own hereditary basis, and that is not what is wanted. The plans proposed by Lord Lansdowne and Lord Rosebery allow the Lords to select some two hundred out of their own number, who, with a certain number of high officials, shall constitute the new chamber, which would be just as conservative as the present chamber, and stronger and more influential and obstructive. We should be quite willing to have the reform delayed until the immediate pressing reforms are gained and the people are educated to love a lord less dearly.

Such reforms are next in order. There are several of them. First comes home rule for Ireland, a sort of home rule which is all that Ireland asks, and which is nothing more than what we are accustomed to in our State legislatures under our national Congress. The enemies of home rule talk as if it would be an independent secession. It would be nothing of the sort. The Orangemen talk as if they would be under the heel of the Nationalist "Romanists," oppressed by the overwhelming majority. The time is past for that; and the organic act, which corresponds to our Constitution, would forbid any such wrong. Lord Lansdowne complains that the people have given no mandate for home rule, as if he had not done his best thru two elections to warn the electors that with the abolition of the veto by the Lords would follow home rule for Ireland. And follow it will; there is no concealment or subterfuge about it. Such a bill will pass the present House of Commons, will be rejected by the Lords, and will finally prevail after the lapse of two or three years, unless the present Parliament should come to a sudden end, of which there is no apparent likelihood. But when it comes we trust it will be such a measure as will not be sectional, but will apply to Scotland and Wales and England as well, and will thus disarm criticism. Parliament now has too much to do; it needs relief from local legislation.

Then there is disestablishment in Wales, with Scotland and England to follow. It will be vigorously opposed, but it is just and therefore must prevail. Privilege always objects to curtailment, and we judge that the Welsh bishops who voted against the veto bill did so because of the fear of disestablishment; they would not vote with the Archbishops of Canterbury and York and nine bishops who supported the Government, even if against their will.

Then will follow, if not immediately, such an education bill as the Lords rejected, and much have they suffered for that error. It will not be a perfect bill, for Great Britain has not yet learned that the public school, supported by all the people, believers and non-believers, is no place to enforce religion. Religion enforced by law ceases to be religion. Religion must in its own nature be free.

One more reform that needs and will receive speedy attention is the abolition of plural voting. As the law now stands a man who has certain property can vote in half a dozen or more different places. This gives extreme advantage to wealth, and wealth is conservative; it keeps all it has ever held. It values property where it should value manhood.

The defeat of the Lords is called a revolution; but it is only the beginning of a revolution, or the first of a succession of peaceful revolutions which will end only when aristocracy makes full and final submission to democracy. It may take years in Great Britain, for the people are slower to act than in France or Portugal. An Englishman must leave England and emigrate to Canada or Australia to be fully converted to democracy. There is no such fetish as aristocracy in the five dominions.

## Pioneering Without Pain

THE Government of Australia has before it a problem much the same as confronted our Government a generation ago; that is, the settlement of about a million square miles of arid lands. But it is being solved in a very different way. The Australian Government believes in giving its colonists a fair start, equipping them for their struggle against Nature with the arms of modern agricultural and engineering science. The American Government thought that it was doing its full duty with unexampled generosity when it offered a quarter sec-

tion of land to every man for a homestead. This policy had worked well east of the hundredth meridian; why not west of it, ignoring the fact that nobody could get a living on a quarter section by itself, either by pasturage or farming, while by collective effort the land would support a denser population than the East.

How could the emigrant know when he had crossed "the dead line"? As he passed thru the fertile farms of Eastern Kansas to the unclaimed region beyond, his wagon cover exprest his courage and determination: "Kansas or Bust." A year or two later back he came over the same route, starved out, burnt out, eaten out, dried out; this time with no extra horse hitched behind and no chickens cooped under the wagon; the whole outfit the palpable expression of defeat, and no need for scrawling on the sagging canvas the confession of failure in the word "Busted."

It was such experiences as this that gave rise to the story of the immigrant about to return to the old country who was met on the dock at New York by a fellow countryman just landed. (The nationality depends upon whatever dialect the narrator is most skilled in.) Said the new arrival: "Tell me, now, is it true that Uncle Sam gives every man a farm?" "No," said the man from the Far West. "You ain't got it quite right. Uncle Sam bets you 160 acres agin $200 that you can't live on the land five years, and the old man wins every time."

The western half of the United States is at last being settled up, but it has been at the cost of almost incredible hardship and suffering, and after years of bloodshed and fraud which are the inevitable result of antiquated and inadequate legislation. The common law doctrine of riparian rights, according to which water may be withdrawn from a stream only on condition that it is returned undiminished in quantity and unimpaired in quality was held to apply to the irrigated region where water must be used up if the land is to be cultivated. For the economical utilization of the water supply, a large area of land must be reclaimed together by means of great reservoirs and hundreds of miles of ditches. Where this was done by corporations the settlers were apt to be squeezed out after a few years by the raising of water rates and the land resold. And if a man worked independently, finding a place beside a creek where he could dig his own ditch, he might, after years of hard labor, be forced to abandon the home he had created out of the desert because somebody upstream in another State had cut off all his water. Very likely more money has been paid to lawyers in futile and exasperating litigation in the West than has been expended in digging ditches. This waste and suffering might have been avoided if it had been earlier recognized that the theory of individualism in agriculture did not apply west of the hundredth meridian.

Now Australia is profiting by our failures and successes and is starting in at the point we have been slow to reach, namely, the construction of irrigation systems by the Government and colonization on a large scale under expert direction. The Murrumbidgee irrigation scheme will open up 1,344,000 acres of land in New South Wales and make room for 200,000 settlers. One-fourth of this land will be watered and the rest used for pasture by the farmers. Prof. Elwood Mead, who did much to free our Western States from the curse of the common law, naturally lays stress in his report of the scheme upon the freedom from water controversies and the insecurity arising from riparian rights. The title to both water and land in fact remains with the Government. The land is not to be sold, but leased in perpetuity; the rentals to be not greater than 2½ per cent. of the unimproved capital value of the land, subject to reappraisement twenty-five years after the first occupation and every twenty years thereafter. The proprietor may sell his farm after five years, but only to a *bona fide* and qualified resident. The rent takes the place of taxes, so the system approximates the Henry George plan. The ordinary municipal and township officers may be dispensed with, since the irrigation officials will locate towns and roads, construct streets and houses, and provide water, lights and drainage. Before any settlers are invited, part of the land will be fenced and plowed and bungalows built. Let those of our readers who spent their earliest years in dug-

out-, cal houses and sheds take notice that these bungalows will be convenient, outwardly attractive and varied in appearance. The State model and experiment farm will provide seeds and fruit trees of approved varieties, thus avoiding the immense loss to our American pioneers thru the purchase of poor seed and unacclimated stock. Teams and farm machinery will be loaned to the settlers on the start. In short, the scheme bears about the same relation to our pioneering ways as the Pullman car bears to the prairie schooner. Doubtless we must make some allowance for the excessive optimism characteristic of a land prospectus, even when issued by a State, but at any rate the proposition is attractive and the invitation of the Government of New South Wales to American settlers is likely to meet with some response from those who feel themselves impelled by the spirit of their race to move on. But perhaps the American of pioneering instinct would not be happy where there is no chance for real estate speculation or a fight over the location of the court house.

## The Recall of Judges

THE speech of Senator Owen on the right of election and recall of Federal judges is the ablest explanation and defense of this questionable suggestion that has been offered, and nothing better is likely to appear. Senator Owen has undertaken to justify his measure from history and precedent, and on grounds of sound reason and common sense. He has also argued that our republican institutions, more than endangered, have been extensively undermined by judicial usurpation, and that the American people can maintain their rights only by getting and retaining the constitutional power to hold the judiciary directly accountable to popular opinion.

Whether Senator Owen's contention that the courts have usurped power be conceded or not, discussion of the wisdom of bringing them to account by the recall is worth while. Senator Owen reminds the public that already thirty-five States elect their judges by popular vote, five elect by the General Assembly, five appoint. All have practical recall, since tenure is for a fixed term, except in Massachusetts and New Hampshire. In both these States the legislature may recall. Therefore, unless it can be shown that the State judiciary system is generally a failure, we have no warrant for the assumption that the people would act rashly if they had direct power over the judges of the Federal courts.

We are disposed to agree with Senator Owen that popular constituencies, on the whole and in the long run, are conservative. Excitable elements there are in every population, but also there are dull, phlegmatic elements, and it is generally true that in doubtful cases popular decisions are negative. This phase of social psychology and its political consequences were thoroughly examined nearly a generation ago by Sir Henry Sumner Maine, and subsequent experience in both Europe and America has substantially verified his conclusions.

We are surprised, then, that Senator Owen does not see that his argument proves too much. Whether we look at the problem by the light of precedent, or by the principles of social psychology, it appears that the recall of judges could hardly operate in any other way than to prevent the progressive evolution of constitutional law. Senator Owen will hardly contend that State courts have been more regardful of personal liberty and popular rights than the Supreme Court of the United States has been. In so far as special privileges have been intrenched behind moss-grown decisions, they have enjoyed such protection at the hands of State judges rather than of the Federal courts; and Mr. Owen himself calls attention to the interesting circumstance that the right of recall of judges theoretically enjoyed by the people of Oregon for ten years has not yet been exercised. He says, to be sure, that the excellence of the proposed plan lies in the fact that if the recall can be exercised, its use will, in general, be unnecessary. Here, we think, he makes a serious error of observation and argument.

For the probable effect of this radical innovation is not likely to turn upon the mere aptitude of the people for self-government, as Mr. Owen assumes. It will turn rather upon the abundantly established fact that, however competent a political population may be, when it is confronted with the task of choosing an

enormous number of candidates for elective offices, it shirks the duty and leaves the choice to professional politicians. We do not for a moment doubt that if the American people had no other political duties than the nomination and election of judges, they would have an upright and distinguished judiciary. Unhappily, they have undertaken to nominate and elect so many officials of one kind and another that not one voter in a thousand knows anything whatever about 90 per cent. of the names on his ballot. Practically, therefore, the proposition to extend the elective function and to supplement it by recall is not a proposition to elect, after all. It is merely a proposition to appoint judges by political bosses instead of by a responsible executive.

And of appointment by bosses we have, and are likely to have, quite enough. To throw the United States Supreme Court which, with all its faults, is a dignified, learned, conscientious and high-minded tribunal, into the arena of practical politics, would be a calamity of incalculable magnitude.

## The South and Immigration

THE INDEPENDENT has received a very long protest from Mr. J. H. Patten, general counsel of the Farmers' Educational and Co-operative Union of America. The purport of this communication seems to be to establish as a fact that the whole South is a unit in desiring but little immigration from Europe. We are not particularly interested in the question. If the farmers of the Southern States do not care for Germans and Hungarians and Italians, or if they prefer the negro help which they have, it does not greatly concern us. We are quite willing to believe that the South is something of a unit on this question. If it is a unit, then we consider it a fair deduction that the negro is a much better fellow than he has been taken for; especially that he is a good deal better farmer, both on his own account and his help for white people. Of course we are glad to find this out, and we are very sorry that our Southern friends should have any trouble with what few white immigrants find their way into those States.

Our correspondent explains that South Carolina, at a cost of about $40,000, brought in "two ship loads of carefully selected Northwest Europeans"; but that they were badly fooled, and that most of their cargoes "turned out to be Southern Europeans." We should certainly imagine that any ordinary white man would be able to tell the difference between an Italian and a Belgian or Norwegian. However, it seems that the State Legislature of South Carolina repealed the law establishing a State Bureau of Immigration, and forbade State officials from bringing such folk into the State. We are told that Georgia has had just as sad experience, and that Virginia has gone back on its earlier desire for immigrants. Other States are quoted, enough perhaps to establish the general fact that the South is pretty well content with negro help.

Then comes the fundamental proposition, that "ninety-five per cent." of the people of the South and West "do not appreciate the need of all this hot haste to settle every possible cultivable acre of land, or to develop every possible resource." This sort of nonsense ought hardly to find its way into print from any quarter. Any man who stands for the farming element of this country should know that we cannot, under a system of strenuous development, do anything more than make ends meet. With the present increase of population we have got to develop our resources in order to feed the people. If any State prefers a thin population, with scanty crops it should be modest about telling of it. We do not believe any such State exists.

So far as we know the South, most of the people are waking up to a very progressive agriculture. When we are told that "what few places there are that will do for cultivation might well be kept for our children, etc," we doubt if the writer is warranted by any organization whatever in so expressing himself. Even New York State and Ohio have hardly begun to bring their natural resources under control. To talk about the "few waste places" in Georgia and Louisiana is to talk nonsense. Not one-tenth of the acres of the Southern States is yet scratched with brain work. They will stand a thousand shiploads of Europeans before they are thoroly waked up to

produce such crops as we hope every acre in the United States will produce. Do the very best we can, another hundred years will be used up in getting agriculture readjusted to science. We are losing by ignorance more than we are getting out of the soil—by far. We are just learning that soil need never be worn out, and yet a large amount of American soil is, especially in the Southern States, badly used up. We have also just got acquainted with legumes and Nature's way of making soil. So far as we can foresee, our grandchildren and great grandchildren will have enough to do without our squatting in the marshes, and refusing to pull stumps out of our corn lots. We are not going to try to settle the question whether the farmers of Georgia agree with those of other Southern States or not; if we said anything to that effect we are willing to take it back, and if they are unanimously opposed to foreign laborers it is their own business. We do not, however, quite understand why the white people, who so recently enslaved the blacks, should now enslave themselves to the demands of their former laborers.

**A Community Crime**

A mob of citizens of the great, prosperous and "civilized" State of Pennsylvania celebrated last Sunday by dragging a negro from the hospital, where he lay under arrest, carrying him, cot and all, to a lumber pile in the outskirts of the town, and burning him there, chained to his cot. This occurred at Coatesville—within 40 miles of Philadelphia. There were in the case absolutely no extenuating circumstances for the lynchers to plead in self defense. The negro they burned had attempted robbery; he had shot and killed a special officer; he deserved to be hanged, and would have been hanged in the ordinary course of justice. And having, without provocation, cheated justice, this Pennsylvania mob must not go unpunished. The people of Pennsylvania, above all the people of the fine old county which this barbarous lynching has dishonored, will almost inevitably (even if selfishly, from calculated motives) express by voice and action their loathing for the deed of the mob, and their condemnation of its members individually. Now, also, is an opportunity given to the somewhat flabby officers of justice of Chester County to repair their reputations. But it is to the community that we chiefly look. Such lawlessness as Sunday's is costly in the end, as has been found in other States, on other occasions. Chester County has its share of disorderly black men; but it will never better the situation by teaching them the ugly lessons of race hatred and organized lawbreaking. The spirit of one part of the community has exprest itself in murder by mob. It is now for the rest of the community to express *its* spirit: giving up to justice malefactors who lowered themselves below the level of the man they tortured, and mercilessly ostracising any of the lynchers who escape legal punishment.

**Bottling Sunshine**

The underlying principle of the Sun Electric Generator Company was, says a New York newspaper, "bottling sunshine." The man who claimed credit for the idea, one Cove, and the promoter who directed a corps of 700 selling agents, Elmer E. Burlingame, went to the Tombs when Post Office Inspectors had made an investigation. When Jonathan Swift wrote "Gulliver's Travels" his account of the scientist who bottled sunshine extracted from cucumbers was regarded as satirical. With the scheme of Burlingame and Cove before us, it looks to us as if Jonathan's proposition might be marketable. Had the man of letters only hired an office and sent out solicitors, instead of smiling to himself and writing a book, he might have made a fortune and settled an annuity on Stella.

**Censorship and Insurrection**

The American Federation of Catholic Societies has just held its annual meeting in Denver. While it is not a body that has any right to represent Catholicism—for only the clergy can do that—it has the support of a number of bishops, while others of the hierarchy regard it as rather an annoyance than a help. It has uttered a very proper protest against immoral and licentious plays, for even laymen have the right to do that. We recall that it was another complaint that the Archbishop of Paris made

against D'Annunzio's "The Martyrdom of St. Sebastian," which he condemned before it was played and without having read it, but he was told it was ecclesiastically unsound. His denunciation did not in the least affect its success. In the daily papers which give the text of the denunciation by the Federation of Catholic Societies of plays classed as immoral is a cablegram dated "Lisbon," in which is announced the endorsement by Cardinal Del Val in the name of Pius X of the Royalist movement against the Republic of Portugal. The statement we are unwilling to believe, for the act would be immoral even in Catholic theology. Portugal is not only a *de facto* republic, but since the elections also a *de jure* government, duly recognized as such by our own Government. Here, then, we are told, is the Pope plotting against a lawfully recognized republic, which even the Portuguese hierarchy accepts. We suggest that the A. F. C. S. protest against the slander that such aid to an insurrection can emanate from the Vatican. At least let the official journals denounce it. But they will not, for they are with the Royalists against the Republic.

**The Common Cup**

The Wisconsin State Board of Health has exempted churches from the operation of the rule against the use of a common drinking cup. Similar exceptions have been made in State prohibition laws, because some churches insisted upon a certain percentage of alcohol in their communion wine, regardless of the fact that we have no chemical analysis of contents of the cup used at the Last Supper. Doubtless these exemptions do not seriously impair the health or sobriety of the public in these States, but it is unfortunate that Christian Churches, thru their attachment to ancient usages, should be put in apparent opposition to hygienic and moral reforms. The Old Testament is largely taken up with the enforcement of a sanitary code far in advance of the age and the Christian Church should likewise lead, not lag behind. But Bishop Grafton, of Fond du Lac, says:

"The good Lord would not permit the transmission of disease to any of His worshipers thru the means of their worship of Him. There has never been an authentic case of the contraction of disease thru the communion cup, tho the common drinking cup elsewhere should be strictly forbidden."

This is not in accordance with what we know in general of the Lord's ways of workings. Epidemics are often spread thru the assembling of people for worship. Dr. Saroglau, of the University of Geneva, in his investigation of the subject, found that the communion cup carried living bacteria, the wine used having no effect on the organisms. The danger, however, is not so great as in the use of the loving cup in student fraternities, for church members are presumably free from the worst of the diseases that may be conveyed in this way. The use of individual cups at communion is no new thing. W. A. Matheny, who contributes to the June issue of *The Pedagogical Seminary*, Worcester, Mass., a summary of the literature on the common cup, refers to its use during the plague of 1564 upon the recommendation of Zanchiny, professor of theology at Strasbourg and a former student of Calvin.

**The English Sparrow**

An Ohio farmer is sending out a circular letter, undertaking to start a general crusade against the English sparrow. The Agricultural Department at Washington has been at this job for the last twenty-five years, and it has accomplished very little in the way of exterminating the pest. This Ohio lover of birds, but hater of the sparrow, tells us that it has above everything else to meet the charge of filth. He lives as a scavenger, and has no distaste for manure and rotten waste. This kind of stuff he will collect and fill a hollow tree trunk with a half bushel of it. In this fermenting mass the female crawls to lay her eggs and rear her young. They are made familiar with filth from the outset. On the other hand he is not an insect hunter or worm eater, unless driven to it by threatened starvation. He never hunts out caterpillar eggs or devours slugs, but lives mainly in our grain fields on the ripening grain. He has no affiliation for other birds, not even for other sparrows. He has a taste, however, for lettuce and peas, and he will make as bad work in the garden as an oriole, while otherwise

in crude guise gives us some compensation in the way of beauty and song. The farmer says that this bird is a very early riser and gets in his mischief while the gardener is asleep. If the nests are persistently destroyed, and the sparrow given to understand, without mistake, that his presence is not wanted, he has sense enough to take the hint. In our towns he is making shocking work of all styles of architecture, in order to find roosting and nesting places. Legislation so far has not been able to handle the case, and it is possible that our Ohio farmer, Mr. Davey, for that is his name, may be able to organize the people effectively; we certainly hope that he may.

**Reforestation**

The Government is engaged in replanting some of the old burned over districts of the Northwest. Instead of replanting, however, with firs and pines it has introduced hickory, oak, walnut and other fast-growing hardwood trees. It has planted forty acres on Placer Creek, in Idaho, and will follow with other larger tracts, by way of experiment. It requires from 7,000 pounds of nuts to 12,000 pounds for one of these plantings. If these undertakings are successful other burned over districts will be taken charge of, with the purpose of introducing hard wood. It takes about fifteen years for walnuts to come into bearing, and nearly twice as long for hickories and oaks to become valuable. The length of this period is shortened by judicious pruning and cultivation. The task is enormous, however, looked at from any standpoint. Ten thousand square miles are swept by a single forest fire, and this seems to be the destiny of our forests in spite of all that has so far been done to protect them. It would seem as if the Government should apply its resources to guarantee the safety of the nation's wealth. It is child's play to follow in the path of these fires with appropriations adequate only to restore one-fiftieth of that which has been destroyed.

**Sugar**

*The International Confectioner* tells us that cane sugar, so far from being our only source of supply, can pass into the rear whenever necessary. The writer names rice sugar, or, as the Chinese call it, liquid sugar, as one of the most important. It is of delicious flavor, and sweeter than corn sugar, with which we are already quite familiar. It is imported in cans, and is used largely by confectioners. It makes a splendid candy. Sorghum or corn sugar at one time seemed to be likely to become an extremely important product of our Northern farms. Sorghum growing for the purpose of making syrups is still common all thru the Western States, and is growing in popularity in the South. It seems that there is a sugar imported in 500-pound barrels, by way of Hamburg, which is a by-product in the manufacture of potato starch. It is quite as sweet as corn sugar, and competes with it in the trade. Raisin sugar is made in large quantities in the Asiatic tropics, and reaches the American market in 50-pound tins. It seems likely that rice sugar will be made in our Southern States more freely, while the manufacture of maple sugar in our Northern States is passing into a period of more scientific manufacture. Maple groves seem destined to become maple orchards in some sections of New England and the Northwest. There is no good reason why the maple tree should not be studied and cultivated, and brought to its best yield quite as much as sugar cane. Standing well in the sunshine and kept from injurious insects, while the tapping is done judiciously, the maple tree will yield 5 pounds of sugar annually, while a neglected tree cannot yield over one-fifth of that amount. This sugar problem is still in its infancy.

**The Suffragets and the Vatican**

When woman suffrage got a foothold in Italy, the moment came when it reached the ears of the Vatican. The uproars of the London suffragets had but a faint echo on the Tiber. But when the banners of the new movement flew along the Flaminian way and entered the Eternal City, His Holiness sat up and took notice. It has leaked out that a secret pontifical brief has been sent or will soon be on its way to the archbishops and bishops of the entire world, condemning woman's suffrage, root and branch. The suffragets are put in the

same scale with the Modernists. Feminism and Modernism are the two flails of Satan, which His Holiness will strive to purge the world of. While no doubt most anxious about Italy and other Latin lands, yet the Pope directs that the crusade begin in England and the United States: the two sources of novel, advanced ideas. Modernism not only lives but is spreading; so too in all likelihood will Feminism.

**Four Centuries of the British Post Office**

It has long been the policy of the British Post Office to make the work it is doing for its patrons popularly understood. If new organization or new machinery is added, the Post Office is desirous that people should know that new services are available. Every extension of the services—postal, telegraph, telephone—and every cheapening of post office charges, is extensively advertised by placards displayed inside the post offices, and on the counters for sale at each post office there is a two-cent handbook, frequently revised and always up to date. By direction of the Postmaster-General a popular history of the Post Office has been written from its records which is now being sold by the Government publishers —Wyman and Son, Fetter Lane, London E. C.—at ninepence a copy. Like most other British institutions the Post Office has a history that goes a long way back. The story as told in this survey begins in 1482, when a postal service was organized to carry the King's despatches, and comes down to 1911, when, to mark the Coronation year, the charges in the oversea parcels post department were reduced by one-fifth, and several extensions were made in the work of the Post Office Savings Bank. Until the year 1839 is reached the story has little more than an antiquarian interest. Then the two-cent letter rate was established, and there began the developments which have now brought the Post Office into such close touch with the people and added so enormously to its revenue earning power —most of them belonging to the period between 1870 and 1911. At the end of the eighteenth century the net revenue of the Post Office—the amount it contributed to the relief of national taxation—was £720,000. At the end of the nineteenth century it was £3,710,000; while for 1909-10—the last year for which statistics are given—the net revenue was £4,910,000. Gladstone, as far back as 1866, made a remarkable claim for the British Post Office. "I am far from thinking very highly of our rank as a nation of administrators," he then wrote, "but perhaps if we could be judged by the Post Office alone, we might claim the very first place in this respect." The authors of this history of the British Post Office do not recall Gladstone's claim of nearly half a century ago; but it could be made today with much better ground than when it was made; and today there is no State Department in which the British have more confidence than in their Post Office. A question that comes to mind in reading this popular story of the British Post Office is when will it be possible to make a similar claim for the United States Post Office, and when will our Post Office be doing as much service for us. The answer to such a query is —just as soon as the business-like methods and the eagerness to serve that characterize the British Post Office are adopted in the United States Post Office, and the interests of express and telegraph companies cease to be put before the interests of the country at large.

The navies belonging to the British Colonies are to be wholly under the authority of the several dominions, in time of peace, and even in time of war, unless the dominions consent to put them under the British Admiralty. The agreement with the mother country is thus worded:

"In time of war, *when the naval service of a dominion or any part thereof has been put at the disposal of the imperial Government by the dominion* authorities the ships will form an integral part of the British fleet and will remain under the control of the British admiralty during the continuation of the war."

That is, Great Britain might be at war with Germany, and under obligation to defend its colonies, and yet Canada might refuse to give the aid of her navy, and keep it for her own protection. In time of peace Australia, for example, might do what she pleases with her vessels of war. Possibly she might make a

land on New Guinea as he has wanted to do in the past.

Our late correspondent, Dr. DeForest, friend and defender of Japan, is to have a memorial in the form of a substantial brick church in Sendai, which will cost something more than $10,000. Most of the gifts for it will be made in Japan, but it would be well for American friends here of this devoted missionary to give their aid. He was honored by the highest classes in Japan, and men of distinction there have given their aid. The well-to-do Japanese are just now rather hard prest because of the large subscriptions made to the fund for the sick poor, which the Emperor started with a gift of $750,000. About $10,000,000 has been subscribed, and they hope to raise it to $15,000,000. This makes other schemes go rather hard just now. Subscriptions can be made to the treasurer of the American Board, Mr. Wiggin, or to Dr. D. Crosby Greene, Azaba, Tokyo, Japan.

Here is an illustration of what a labor union should not do. Senator Dillingham having favored the admission of the Chinese, the Vermont branch of the Amerinan Federation of Labor, at its meeting last week, denounced his action. Not content with shutting out all Chinese laborers, it adopted a resolution calling for an increase of the head tax on all immigrants from $4 to $10, also requiring that they be able to read and write in their own language. We are reminded of a prayer by Theodore Parker, who, if not a very orthodox Christian, yet had an ethical instinct:

"May our continuous industry be so squared by the Golden Rule that it shall nicely fit with the interests of all with whom we have to do, and so by our handicraft *all mankind* shall be blest."

While we are giving the heartiest welcome to Admiral Togo, the greatest of living naval heroes, we will recall that he is of a race which a brutal element among us would exclude from our shores. But he will not meet any such insults as are recounted in *The Hindustani Review* by Mr. Saint Nihal Singh, who is writing for that journal in Calcutta a series of articles in which he does his best to tell his countrymen in India how rude, indecent and immoral are the social conditions of the United States. The eleventh of the series treats of the insults he and his friends have received for their dark color, and the picture is all dark. We wonder he can make his long stay in a country where everything is so degraded.

Hereafter a member of Parliament will be able to live modestly on his salary of $2,000 a year. The law which allows the salary was assured when the courts decided that the labor unions could not use their funds to pay their members who were elected to the House of Commons. The salary is very moderate, from our standard, but it makes it possible for a poor man to serve, whether he be a Laborite or a Nationalist. Hitherto the Irish members have had to beg their support in the United States and Canada, which was no dignified position.

In connection with Mr. Granger's article, "The Stain on Our Flag," published in this issue, it will interest our readers to know that the present Colombian Minister to the United States, Gen. Pedro Del Ospina, was an ardent advocate of such constitutional changes as would have ensured ratification of the Hay-Herran Treaty by the Colombian Senate of which he was then a member. General Ospina was the associate and inspiring genius of General Reyes when, immediately after the "secession," as special emissaries to Washington, they advanced such powerful arguments against our action.

How many home-coming tourists are like the Frenchman in Switzerland, who, in mountain climbing, found himself in a pretty little wood with no prospect beyond it, and exclaimed: "Look! this is all right! You might think you were in the suburbs of Paris!"

Senator Bailey has resigned again—this time as member of the National Monetary Commission. The United States was resigned to Senator Bailey's resignation long, long ago.

# Insurance

## A Friendly Letter

We take pleasure in publishing the following communication from the publication manager of the Metropolitan Life Insurance Company of New York, which is in answer to our editorial of last week. We think his points are well taken. We should have taken more space to draw the distinctions he does here:

An article published in The Independent of August 10, entitled "The Poor and Insurance," will give the general reader a wrong impression because, inadvertently I am sure, no clear distinction is made between the different classes of insurance. You speak of the Massachusetts Savings Bank act which "has caused the competing regular insurance companies to lower their rates." In the next paragraph you say:

> "Nevertheless, there is no excuse whatever for insurance companies so to take advantage of the helplessness and ignorance of their poor clients as to compel them to compromise or adjust claims so that thousands of dollars are withheld from victims of accidents or from their widows, children or dependents, and diverted to increasing dividends or surplus."

You then speak of the fact that a number of insurance commissioners are making an investigation of some companies. Because the Massachusetts Savings Bank act deals wholly with life insurance, and because this investigation made by the commissioners is of companies which do other than life insurance, the life insurance companies suffer by the article.

The Metropolitan Life Insurance Company, which has the largest number of industrial policyholders in the country, does simply a life insurance business, having more than six million industrial policyholders, and it is not just to give, inadvertently, to them and to the public the impression that they are being cheated. Superintendent Hotchkiss, of the New York Department, completed last year an investigation of the Metropolitan, conducted by a number of his expert examiners, which extended over a period of fifteen months. It was, he says, the most thoro investigation ever given to any similar company in the country. In his report of this investigation he points out that the ratio of total expense to total premiums has in six years decreased 7.13 per cent. This is the reduction in the cost of the poor man's insurance, and during the same period in the companies which do not do an industrial insurance the decrease has been 5.6 per cent. This is the rich man's insurance. Mr. Hotchkiss also says that this company, considering the volume of its business, furnished industrial insurance substantially at cost.

With reference to the payment of claims, which was exhaustively investigated, the Commissioner says: "The claims received averaged from 600 to 800 each working day. The percentage for rejections is small, being in 1909 less than one-half of 1 per cent."

When you say "We hope that some practical way may be found to prevent by law or otherwise this most inhuman way of cheating the poor," and you do not make exception of life insurance companies which have been given a clean bill of health by the Commissioner, you are likely to cause unnecessary alarm and do real injury to those of the great army of industrial policyholders who would get an altogether incorrect impression of the facts concerning the cost of their own policies and the treatment which they may receive when those policies become claims.

I am enclosing a copy of the report of the Superintendent of Insurance, to which I have referred, with passages marked.

Very respectfully yours,
Luther B. Little.

Statistics published in the annual report of the New York Insurance Department, Part Two, show that the assets of American insurance companies were, in 1910, $3,693,248,328, an increase of $225,000,000 over the previous year. New York State companies were responsible for about half of this increase. The liabilities of the various companies, excluding gross surplus and special funds, were $3,500,000,000, of which $2,062,871,391 was in New York companies. The gross surplus and special funds amounted to almost $200,000,000, of which $81,342,070 was in New York companies. In the year 1910 New York insurance companies issued 382,041 "ordinary" policies, insuring $678,006,384, an increase over 1909 of over $100,000,000. An improvement has been steadily maintained in the life insurance business since 1907.

Henry Evans, president of the Continental Insurance Company and the Fidelity-Phenix Insurance Company, has been made chairman of the executive committee of Manning, Maxwell & Moore. The controlling interest in the company is held by Mr. Charles A. Moore, whom Mr. Evans represents. Mr. Moore has been in ill health and unable to attend to the detail of business matter.

## Crop Losses

The Government's crop report for August 1, issued on the 9th, compels a revision of estimates. Owing to the excessive heat and dryness of July, there have been heavy losses, the reduction for spring wheat being 35,000,000 bushels, while the indicated yield of corn is less by 336,000,000 bushels than it was a month earlier. We shall have 30,000,000 bushels less of wheat than in 1910, altho the area is greater by nearly 3,000,000 acres. The condition of spring wheat on August 1 was only 59.8, against 73.8 on July 1, and a ten years average of 82.3. The yield will be the smallest since that of 1900. The yield of corn will fall below that of last year by 500,000,000 bushels, or nearly 13 per cent., and it will be taken from an area exceeding last year's by nearly 2,000,000 acres. Corn's condition on August 1 was only 69.6, against 80.1 on July 1, and a ten years average of 81.2. The indicated yield per acre is only 22.6 bushels, against 27.4 harvested in 1910, and a five years average of 27.1. All the condition percentages are low, that of rice excepted. Only 249,872,000 bushels of potatoes (condition 62.3) are promised. The ten years condition average was 84.8, and the five years average yield per acre 97 bushels, against 71.5 bushels this year. The tobacco crop falls from 984,000,000 pounds to 600,000,000, and the crop of hay is the smallest in fifteen years. In the following table are shown the indicated yields for 1911 and the harvested crops of 1910:

| | 1911. | 1910. |
|---|---|---|
| Corn | 2,620,221,000 | 3,125,713,000 |
| Winter wheat | 454,822,000 | 464,044,000 |
| Spring wheat | 209,646,000 | 231,399,000 |
| Total wheat | 664,468,000 | 695,443,000 |
| Oats | 817,800,000 | 1,126,765,000 |
| Rye | 31,262,000 | 33,039,000 |
| Barley | 140,056,000 | 162,227,000 |
| Buckwheat | 14,498,000 | 17,239,000 |
| Flaxseed | 22,898,000 | 14,116,000 |
| Rice | 23,076,000 | 24,510,000 |
| Potatoes | 249,892,000 | 338,811,000 |
| Hay, tons | 49,039,000 | 60,039,000 |
| Tobacco, lbs. | 600,588,000 | 984,588,000 |

Not since 1906 has the hay crop been less than 60,000,000 tons, and in 1908 it was 70,000,000. Canada has plenty of hay, but if we import it we must pay a tariff duty of $4 a ton. Our Government says:

"Taking into account both acreage and condition, indications are that the wheat crop will be 4.1 per cent. less than the average annual production of the past five years, corn 7 per cent. less, oats 12.3 per cent. less, barley 16.2 per cent. less, buckwheat 8.8 per cent. less, potatoes 21.9 per cent. less, tobacco 25.5 per cent. less, flax 2.3 per cent. less, rice 7.5 per cent. more and hay 22.8 per cent. less."

Cotton, lemons, apples, oranges and rice were the only crops which on August 1 showed conditions above the average for recent years. The cotton crop promises to exceed by 1,000,000 bales the largest that has preceded it.

....It is estimated that Great Britain's share of South American trade is 35 per cent., and that Germany's is 16 per cent.

....J. Ogden Armour says we can no longer afford to export beef, as our entire domestic supply is needed for home consumption.

....The Transvaal's gold output in July again broke the record, being £3,012,738, against £2,907,414 in June, and £2,913,734 in May.

....Dividend and interest payments by railroads, industrial and traction companies in August, as compiled by the *Journal of Commerce*, will be $95,781,986, against $87,700,359 in August of last year.

....By the operation of the sliding scale established by the Strike Commission in 1902, the anthracite mine workers have received about $28,000,000 in addition to the wage increase of 10 per cent. which the commission granted.

...The output of pig iron continues to decline. It was 1,893,456 tons in May, 1,787,566 in June, and 1,793,068 in July, a longer month than June. In July the daily rate was the smallest since the opening of the year. But there has recently been improvement in the steel trade.

VOL. LXXI NEW YORK, THURSDAY, AUGUST 24, 1911 No. 3273

## Survey of the World

**Mr. Taft's Vetoes Upheld**

The President's veto of the joint resolution for the admission of New Mexico and Arizona to Statehood was sent to the House of Representatives August 15. In condemning the recall of judges under the Arizona Constitution, he called this a provision for "legalized terrorism."

"This provision," he continued, "in its application to county and State judges, seems to me so pernicious in its effect, so destructive of independence in the judiciary, so likely to subject the rights of the individual to the possible tyranny of a popular majority and, therefore, to be so injurious to the cause of free government that I must disapprove of a constitution containing it."

The message in Congress was heard in absolute silence. It was then loudly applauded from the Republican side. In spite of Democratic opposition, the veto was accepted, after a conference, altho the Statehood resolution, originally passed the House by a vote of 4 to 1, and the Senate by a vote of 3 to 1. The agreement of the conferees is based on the elimination of the judiciary recall and provision for making the New Mexico Constitution more easily amended.

The President's second veto was brought into the House of Representatives late on the afternoon of August 17. Then the Democratic leader arose and announced that he desired the wool bill with the message of veto to be laid on the table till the morrow, when he would move to pass the bill over the veto. This time the Democratic majority furnished the cheering. In his message, Mr. Taft quotes from the platform on which he was elected, and its tariff reduction plank. "I called an extra session of the Sixty-first Congress," he continues, "at which a general revision of the tariff was made and adopted in the Payne bill."

"The great difficulty, however, in discussing the new rates adopted was that there were no means available by which impartial persons could determine what in fact was the difference in cost of production between the products of this country and the same products abroad. The American public became deeply impressed with the conviction that, in order to secure a proper revision of the tariff in the future, exact information as to effect of the new rates must be had, and that the evil of log-rolling or a compromise between advocates of different protected industries in fixing duties could be avoided and the interest of the consuming public could be properly guarded only by revising the tariff one schedule at a time.

"To help these reforms for the future I took advantage of a clause in the Payne tariff bill enabling me to create a tariff board of three members and directed them to make a glossary and encyclopedia of the terms used in the tariff and to secure information as to the comparative cost of production of dutiable articles under the tariff at home and abroad. . . .

"The business of the country rests on a protective tariff basis. The public keenly realized that a disturbance of business by a change in the tariff and a threat of injury to the industries of the country ought to be avoided, and that nothing could help so much to minimize the fear of destructive changes as the known existence of a reliable source of information for legislative action. The deep interest in the matter was evidenced by an effort to pass a tariff commission bill in the short session of the Sixty-first Congress.

"Such a bill passed both houses. It provided a commission of five members, to be appointed by the President, not more than three of whom were to belong to the same party. . . . Because of the limited duration of the session, a comparatively small minority was able to prevent its becoming a law.

"On the failure of this bill I took such steps as I could to make the Tariff Board I had already appointed a satisfactory substitute for the proposed tariff commission. The board differs in no way from the tariff commission as it would have been, except in its power to summon witnesses; and I am advised by the members of the board that without this power they have had no difficulty in securing the information they desire. . . .

The report on Schedule M (pulp and paper) has already been sent to Congress. Full reports on wool and cotton will be submitted to Congress in December. I have also directed an investigation into the metal and leather schedules, the results of which it is hoped can be submitted to Congress at its first regular session, in time to permit their consideration and legislative action, if necessary. . . . If delay in the passage of a bill to amend Schedule K can be had until December, Congress will then be in possession of a full and satisfactory report upon the whole schedule. . . . Schedule K is the most complicated schedule in the tariff. It classifies raw wool with different rates for different classes; it affords the manufacturer what is called compensatory duty to make up for the increased price of the raw material he has to use due to the rate on raw wool, and for the shrinkage that takes place in scouring the wool for manufacture, and it gives him, in addition, an ad valorem duty to protect him against foreign competition with cheap labor. The usages which prevail in scouring the wool, in making the yarn, and in the manufacture of cloth present a complication of technical detail that prevents any one, not especially informed concerning wool growing and manufacture, from understanding the schedule and the effect of changes in the various rates and percentages.

"If there ever was a schedule that needed consideration and investigation and elaborate explanation by experts before its amendment, it is Schedule K. There is a widespread belief that many rates in the present schedule are too high and are in excess of any needed protection for the wool grower or manufacturer. I share this belief, and have so stated in several public addresses. But I have no sufficient data upon which I can judge how Schedule K ought to be amended or how its rates ought to be reduced, in order that the new bill shall furnish the proper measure of protection and no more. Nor have I sources of information which satisfy me that the bill presented to me for signature will accomplish this result. . . .

"There is no public exigency requiring the revision of Schedule K in August without adequate information, rather than in December next with such information. December was the time fixed by both parties in the last Congress for the submission of adequate information upon Schedule K with a view to its amendment. Certainly the public weal is better preserved by delaying ninety days in order to do justice and make such a reduction as shall be proper, than now blindly to enact a law which may seriously injure the industries involved and the business of the country in general."

The Democratic majority, with help from the Republican insurgents, failed by 14 votes to pass the wool revision bill over this veto. On the free list bill the vote was 226 to 127, or 11 votes short of the required two-thirds majority.

**In Congress**

Since receiving the President's vetoes, Congress has not been inactive. An early adjournment is looked for, but in the meantime the Senate has passed the House cotton revision bill and adopted amendments to it, revising the steel and iron schedule, making a horizontal reduction of 25 per cent. in the chemical schedule, reducing the duties on all machinery and parts of machinery used in cotton manufacture to 30 per cent., and cutting the rate on bituminous coal to 45 cents a ton, except in the case of Canada, where it is to go on the free list. Finally, an amendment providing that if the cotton bills and amendments did not reduce duties as was intended, all rates should be 30 per cent. lower than those contained in the Payne-Aldrich law was adopted. All of these measures were of Democratic origin. The House cotton bill passed, with all its amendments, by a vote of 29 to 24.——The Senate Committee on Foreign Relations characterizes President Taft's general arbitration treaties with Great Britain and France in their present form as "breeders of war and not of peace." The committee predicts that the treaties, if ratified as presented by the Administration, would arouse a series of international disputes, now happily at rest, into "malign and dangerous activity." The majority report is not concurred in by Senators Burton, Cullom and Root. The President meanwhile has told the Methodist camp meeting at Ocean Grove, N. J., where he addressed 8,000 persons, that Senatorial prerogatives in this matter are no more sacred than the executive prerogative. The Senate's "sensitiveness" should be respected, not made light of; but the question "must ultimately be referred back to the people." Continuing:

"Now if we have power to enter into arbitration we have the power to agree to enter into arbitration under conditions that are described in the treaty, and as we have the right to leave the interests of the country to a judgment of the court to which it is submitted by agreement we certainly have the right to submit to that court to decide whether the particular instance and difference which has arisen or shall arise in the future is within the description of the treaty and of the obligation which we entered into in the treaty. To say that this is an abdication of the functions of the Senate is to say that it is not the function

of the Senate to make an agreement at all which shall bind the Government."

Since the President's speech was delivered, the Senatorial committee has struck from the treaties the paragraph:

"It is further agreed, however, that in cases in which the parties disagree as to whether or not a difference is subject to arbitration under article I of this treaty, the question shall be submitted to the joint high commission of inquiry; and if all or all but one of the members of the commission agree and report that such difference is within the scope of article I, it shall be referred to arbitration in accordance with the provisions of this treaty."

After the action of the committee the treaties were favorably reported to the Senate, which went into secret session for that purpose.

**Lynchings and Aviation**

After unpardonable procrastination, the District Attorney of Chester County, Pa., arrested in all nine persons, two of them only boys, in the case of the burning of the negro murderer, Walker. One of those arrested was Stanley Howe, the special policeman who was set over Walker in the Coatesville Hospital as guard, and made no effort to defend his prisoner. Howe is under $1,000 bail as a "material witness." A confession by one Swartz, a mill worker, has given the prosecutor the names of participants in the lynching. The arrest of "leading citizens" of the little town is looked for. Order has been maintained in Coatesville by the State Constabulary, whose commander, Major Groome, has been on the ground. Governor Tener has insisted upon firm action by the prosecutor, who has been deterred, directly or indirectly, by political influence, from pushing the case with any vigor. The community of Coatesville regrets its shame, but there is no evidence that it wants the guilty punished. Quite the contrary.——A negro preacher, Charles West, recently murdered Marshal Newberry, of Jakin, Ga., and during three days and nights bands of white men scoured the country, killing and whipping negroes, and burning their churches, lodge rooms, and school houses. They seem determined to run every negro out of this region. The officials report that only three negroes have been killed, but others allege that this estimate is too small by half. West has not yet been taken. He was a well-known organizer of his race, and the murder of the marshal apparently followed a vote of his lodge meeting to get him out of the way, as he had raided disorderly lodge meetings. ——Aviation, too, has its victims, St. Croix Johnstone and W. C. Badger having plunged to death at Grant Park, Chicago, where an aero meet was in progress last week. Another aviator fell into Lake Michigan, and Lincoln Beachey came near to having the same experience. Others have turned turtle, escaping fatal injury. The Wright brothers have meanwhile started a patent suit that will test points at issue between themselves and rival makers. The Wrights privately denounce the foolhardy work of the aviators competing for large prizes at Chicago. A Chicago paper names sixty-one men who have lost their lives in heavier-than-air machines since the experiments of Lilienthal were made in Lichtenfeld. At this Chicago meet Oscar A. Brindley, in a Wright biplane, broke the world's record for altitude, soaring 11,726 feet. W. G. Beatty made a record for sustained flight with a passenger, staying aloft 3 hours 42 minutes.——Morrison, the English airman, dropped into the sea near Folkestone, August 15, without injury. Vedrines met with a similar accident a day later, at Trouville.

**The Islands**

Gen. Cincinnatus Leconte took the oath of office as President of Hayti, August 16. Except the Dominican Minister, foreign representatives were absent from the ceremony, having decided not to recognize the new Government till it had received the general support of the people, and arrangements for the adjustment of any claims that foreigners may have as a consequence of the revolution were made. The American Minister has since then (August 19) officially exprest to President Leconte his Government's desire for a continuation of friendly relations; and the French Minister and British Consul have notified their Governments that they are satisfied with the assurances of the new President. The German Minister is non-com-

martial.——When the United States scout cruiser "Salem" leaves Port au Prince for Hampton Roads this week, her place in the harbor will be taken by the gunboat "Marietta." The "Des Moines" will also patrol Haytian waters.——At the time of the Spanish-American War the United States made efforts to establish a chain of weather bureau stations in the West Indies to make reports and warn the American fleet in the event of a hurricane or severe storm. It was believed that Mole St. Nicholas would be an advantageous point for a station, but Hayti did not sanction its establishment. Since then no serious effort has been made to establish the station, but from Port au Prince it is now reported that the United States will be accorded weather bureau rights. This voluntary action is doubtless to be taken as an indication of friendliness toward the United States.——When the new President's Ministry took the oath of office they pledged themselves to advance the interests of the country, to give protection to foreign interests, and to rush the construction of railroads and other public works, respecting existing contracts as the only possible means to save the country and avoid foreign intervention. It is planned, say reports, to negotiate loans thru private bankers and merchants, and not thru the National Bank of Hayti. It is said that certain classes in Port au Prince fear that the Government may come under too stringent foreign domination if the National Bank even indirectly holds the purse strings. (Germans and Americans hold a portion of the National Bank stock.) The United States would like to discourage these loans, which are always dearly paid for in the end; and the preponderating influence of German traders is dreaded.

**Latin-America**

In an engagement on August 19, at Tetilles, Mexico, in which the forces of General Huerta beat back a strong advance of the Zapatists, the main body of the Federal command arrived in sight of Yautepec, a town of 8,000 inhabitants, between Cuatla and Curnavaca, where the first battle of the Morelos campaign will occur, unless Dr. Madero can arrange an armistice. President De la Barra says that General Huerta has orders to occupy Yautepec. General Figueroa, who has 1,000 men at Iguela, has been ordered to advance with all speed and garrison the towns of Jojutla, Puente, Ixtla and neighboring villages. The rebel, Zapato, is surrounded, for Gen. Casso Lopez has a strong force at Jonacates. Dr. Madero charges that General Huerta is working for General Reyes in attempting to produce a state of war in Morelos and show that he (Madero) is incapable of handling the situation. The fact that these charges were made to the President adds to the seriousness of the situation, and infuriates the followers of Reyes. Reports of the sacking of Jojutla and Ixtla are confirmed. Merchants of Jojutla lost goods worth 150,000 pesos when 300 Zapatists entered the town and robbed the business houses. Reports from Guadalajara tell of a fight between rurales and bandits at Yurecuaro, where there is an American colony. Five bandits were killed and ten captured.——With a force of 200 men General Orozco rode into Juarez, August 16, and raided the gambling houses, which he closed. He then arrested Mayor Medina, formerly lieutenant-colonel of insurrectos, and placed the town under martial law.——Election day in Chihuahua, Mexico, passed without disturbance. Abram Gonzales was elected Governor. He was already acting as such under appointment from Francisco J. Madero. The entire State ticket nominated with Gonzales was elected. There was no open opposition to the Governor, who was Dr. Madero's acting Secretary of War when the rebel army was in the field.——Owing to disorder in Lower California, a troop of United States cavalry will patrol the border from Yuma, Ariz., to San Diego, Cal.

**The British Railroad Strike**

The epidemic of strikes in England reached its hight this week in a general strike of all the organized employees of the railroads. The seamen's strike was followed by the dockers' strike and both these having won substantial concessions the railroad men issued an ultimatum demanding of the companies

recognition of the unions and promise of redress of grievances within twenty-four hours. This met with a peremptory refusal on the part of the managers, who pointed out that according to the agreement of 1907 all questions in dispute were to be referred to conciliation boards. This agreement terminated in 1914 and until then the men would have no right to strike. But the men held that the conciliation boards had proved to be incompetent and dilatory and could not be relied upon. Premier Asquith interposed with the offer of a royal commission to investigate the alleged grievances but this was rejected by the men on the ground that royal commissions were even more deliberate and ineffectual than conciliation boards. They claimed that the railroad companies had been unjust and arbitrary in their interpretations of the agreement of 1907 and that the Government had paid no attention to the repeated petitions of the unions for a readjustment of the machinery of arbitration so that it should become effective. Accordingly the executive committee of the Amalgamated Society of Railway Servants telegraphed to all the local unions at the designated time:

"Your liberty is at stake. All railway employees must strike at once. Loyalty to each other is victory."

At this crisis Chancellor of the Exchequer Lloyd-George took the matter in hand and was more successful than the Premier. He explained in the House of Commons that same night that the Government was not proposing a royal commission of the ordinary type but a joint committee composed of two representatives of both the contending parties presided over by a man of recognized impartiality, which would make an immediate investigation into the causes of the failure of the conciliation act. The settlement of the threatened strike of 1907 by the conciliation act was due to Lloyd-George and this had at once brought him to the front as a man of tact and efficiency. His management of the present crisis will add to his reputation. It was chiefly thru his exertions that the men were brought to agree to the joint committee and the managers of the companies to agree to meet their representatives of the unions. At the end of the second day the strike was called off. The Conservative papers denounced the strike in unqualified language, but most of the Liberal organs were inclined to side with the men. Public opinion was divided. All deplored the injury done to the country by the stoppage of traffic, and many condemned the strike as a violation of agreement, but it was generally recognized that the pay of the men was quite inadequate and that they had not been fairly treated. The Government promised the companies that Parliament would be asked to allow a reasonable increase in charges if that should be found necessary because of an advance in wages. The companies agree to take back all the strikers without discrimination.

**The Conduct of the Strike**

According to the labor leaders 250,000 men obeyed the strike order, but the Board of Trade estimate is only 150,000. The train service all over the country was crippled and in some cases altogether suspended, as the proportion of men remaining at work varied from 20 to 80 per cent. in different localities and branches of the service. There was little freight moving anywhere, but passengers and mail trains were put thru slowly and irregularly. Passengers for trans-Atlantic steamers had great difficulty in getting to their ports. "Week-enders" and "resorters" in many cases could not get to their homes. If the strike had lasted a few days longer there would have been serious danger of famine in the northern part of the country. As it was, prices rose alarmingly, and milk, butter, fruit, vegetables and bread ran short in many places. Liverpool suffered the worst, as there other local strikes added to the difficulties of the situation. The desertion of the employees of the electric plant left most of the city in darkness, stopped the tramcars and shut off the power from the printing offices and other establishments. The Government made it plain from the start that it would regard it as a paramount duty to the public to keep open the means of transportation, and this pledge was carried out so far as possible. London was garrisoned by 50,000 troops, and the dome of St. Paul's was occupied

by the signal corps as a heliograph station. In most places the strikers did not attempt to prevent the movement of trains by force, altho in some cases the signal wires were cut and switches blocked. But in the streets of Liverpool, Birmingham, Manchester and other cities the police and soldiers were frequently attacked by the mob with stones and bottles, and many persons wounded on both sides. The soldiers were provided with a hundred rounds of ball cartridges and instructed not to fire over the heads of the mob, but directly at the ringleaders. This was done in Liverpool and resulted in the killing of two men. At Llanelly, Wales, the station was guarded with 500 soldiers, but they could not prevent the mob from tearing up the track, looting stores and burning cars and depots. A troop train was held up and a quantity of ammunition captured. The soldiers charged the rioters repeatedly with fixed bayonets and finally fired, killing three men. Later, when the mob was burning a freight shed, nine of them were killed by an explosion. According to the officers in charge of the troops the rioting at Llanelly was due not to the strikers, but to hooligans, who had seized a carload of beer and whisky and got drunk on it. On Sunday 40,000 railroad men assembled in Hyde Park to rejoice over their victory, as the first time in history that the companies had recognized the right of collective bargaining, the vital principle of trades unionism. Most of the men have returned to work, but the employees of the Northeastern Company are holding out for an eight-hour day and a minimum wage of $5.30 a week.

**Sabotage and Anti-Militarism**

While the English railroad strike was being won the French *cheminots* were trying to settle the question of who was responsible for the failure of their strike and laying plans for a more successful one next time. The recent national convention of railroad men held at Paris was stormy and acrimonious. The last session lasted all night and the congress adjourned at 6 o'clock with many matters unsettled. The chief action was to dissolve the national union and substitute a federation of regional unions, one for each railroad system, and altogether affiliated with the General Confederation of Labor. It is questionable whether this is to be regarded as a victory for the reformer or the revolutionist faction. The General Confederation is revolutionary, but the restoration of local autonomy will allow the more moderate unions to confine their activities to the improvement of their industrial position. The greatest and most heated difference of opinion was aroused by the question of what attitude the convention would take in regard to *sabotage*, that is, the destruction of property and the delay of trains. One delegate denounced sabotage as criminal and called the train-wreckers "monsters in human form." The revolutionists greeted his remarks with cries of "Traitor!" and their speakers held that sabotage was "an honor to the working class, a necessary weapon of industrial warfare," and expressly approved by the General Federation. They called attention to the fact that the railroad men in previous conventions had recommended the stoppage of all trains in case of a declaration of war. Nevertheless the reformers succeeded in passing a compromise resolution expressing disapproval of the two recent attempts to wreck express trains as liable to injure the cause. Some of the reformers even ventured to question the advisability and propriety of a general strike in time of war, saying that the *cheminots* (railroad men) would obey an order for mobilization by an immense majority and that the Germans would do the same. M. Bidegarray, whom the convention delegated to the anti-militarist meeting being held simultaneously in the Salle Wagram under the auspices of the General Confederation, went so far as to say that it was a man's duty in time of war to defend his country and as for him he would never submit to the yoke of the Kaiser. A man of such moderate sentiments was not welcome at the Salle Wagram, and when he appeared on the platform he was hissed and hooted and not allowed to say a word. At this meeting delegations of foreign Socialists joined with the French in denouncing war. The German representative said that it was a lie and a calumny to charge

that the workingmen of either country were patriotic. They agreed that the whole of Morocco was not worth the life of a single German or French proletarian. The Spanish delegate said a declaration of war would in Spain be the signal for an insurrection, for Spanish proletarians would rather die for the revolution than be crushed in the interests of capitalists. Tom Mann, the English delegate, said that the laboring class was bound to oppose all war except one, the war of classes for the overthrow of the capitalist régime.——We should mention here a third group of working men, that is the Union of Catholic Railroad Employees, who while their fellow laborers were approving sabotage and condemning patriotism, spent the night in the big basilica of the Sacred Heart on Montmartre listening to prayers and sermons. These Catholic unionists numbered 3,000 and each local bore a banner emblazoned with the arms of the province, the patron saint and a symbolic locomotive.

*

**The Japanese Administration of Korea**

Count Terauchi, the Japanese Governor-General of Chosen (Korea), in an address to the provincial governors assembled at Seoul, July 1, reported upon steps taken to instruct the Koreans in the trades. There had been established, under the new régime, thirty-five sericultural training houses, twenty-one training houses for weaving, thirteen common sericultural workshops, eight training houses for paper making, three fishery training houses, thirty-seven seedling nurseries, four mulberry farms, eight common industrial workshops, and four industrial training houses. Resident and traveling instructors for these institutions numbered one 150. One hundred and thirty-three public primary schools and seven industrial apprentice schools had been founded, while a decision had been made that a grant-in-aid should be given to 217 various public and private schools. Again, in spite of the remission of taxes in arrears, etc., State revenue as well as the income of the local fund for the six months ending in March showed favorable results, both representing an increase of 938,000 yen together as against the corresponding period of the previous year. The trade during the first five months of this year was an unprecedented success. In comparison with the return for the first five months of last year it (including that with Japan proper) showed an increase of 1,587,000 yen in exports and in imports an increase of 7,753,000 yen. The Governor-General has formed a plan for the development of the Korean railways and for bridge construction. The harbors at Fusan, Chemulpo and Chinnampo are to be improved, and large docks constructed. Telephone lines are being extended. Methods of improved agriculture should be inculcated, added Mr. Terauchi. Regulations for fishery have been lately revised. The guiding object of the new regulations is to protect Korean and encourage Japanese fishermen to settle permanently in this country instead of returning home, as hitherto, as soon as the fishing season was past.——According to Mr. Ebina, a Christian missionary, there are three professing Christians in Korea for every one in Japan. The actual figures are 100,000 and 300,000. But, the *Japanese Mail* points out, "Mr. Ebina does not take any account of the Roman Catholic Christians." Mr. Ebina says that the most remarkable of the changes wrought in Korea by the new régime is in the endeavor of women. Formerly a Korean woman never allowed her face to be seen in public. She covered everything except her eyes. But now Korean girls behave in this matter just as the Japanese do, going about the streets with wholly unveiled faces and in their scholastic costume. In some cases they have adopted foreign custom so far as to shake hands with their teachers by way of salutation. Mr. Ebina alleges that altho the Korean converts are so much more numerous than the Japanese, the latter are far superior in the strength of their faith and in their education. He adds that Christian propaganda in Korea has been carried on entirely by foreign propagandists, and that it is desirable that Japanese pastors should take a larger part in the work.——The Governor-General of Korea announces that the Japanese language shall henceforth be recognized in the curriculum of the primary schools.

# A Hymn to the Peoples

By W. E. Burghardt Du Bois.

O Truce of God!
And primal meeting of the Sons of Man,
Foreshadowing the union of the World!
From all the ends of earth we come!
Old Night, the elder sister of the Day,
Mother of Dawn in the golden East,
Meets in the misty twilight with her brood,
Pale and black, tawny, red and brown,
The mighty human rainbow of the world,
Spanning its wilderness of storm.

Softly in sympathy the sunlight falls,
Rare is the radiance of the moon;
And on the darkest midnight blaze the stars—
The far-flown shadows of whose brilliance
Drop like a dream on the dim shores of Time,
Forecasting Days that are to these
As day to night.

So sit we all as one.
So, gloomed in tall and stone-swathed groves,
The Buddha walks with Christ!
And Al-Koran and Bible both be holy!

Almighty Word!
In this Thine awful sanctuary,
First and flame-haunted City of the Widened World,
Assoil us, Lord of Lands and Seas!
We are but weak and wayward men,
Distraught alike with hatred and vainglory;
Prone to despise the Soul that breathes within—
High visioned hordes that lie and steal and kill,
Sinning the sin each separate heart disclaims,
Clambering upon our riven writhing selves,
Besieging Heaven by trampling men to Hell!

We be blood-guilty! Lo, our hands be red!
Not one may blame the other in this sin!
But here—here in the white Silence of the Dawn,
Before the Womb of Time,
With bowèd hearts all flame and shame,
We face the birth-pangs of a world:
We hear the stifled cry of Nations all but born—
The wail of women ravished of their stunted brood!
We see the nakedness of Toil, the poverty of Wealth,
We know the Anarchy of Empire, and doleful Death of Life!
And hearing, seeing, knowing all, we cry:

Save us, World-Spirit, from our lesser selves!
Grant us that war and hatred cease,
Reveal our souls in every race and hue!
Help us, O Human God, in this Thy Truce
To make Humanity divine!

SOME OF THE PRINCIPAL DELEGATES TO THE RACES CONGRESS
[—] Weardale, president of the Congress, is seated in the center. To his right General Légitime, formerly President of Hayti. Others are representatives of Japan, Persia, Africa, etc.

# The First Universal Races Congress

BY W. E. BURGHARDT DU BOIS, Ph.D.

[Professor Du Bois was the Honorary Secretary for the United States of the First Universal Races Congress just concluded in London. We have heard from others that his was the best address given at any session. We also publish, on the opposite page, his poem, read at the opening session.—EDITOR].

OF the two thousand international meetings that have taken place in the last seventy-five years there have been few that have so touched the imagination as the Universal Races Congress of this summer.

Such a meeting may be viewed in many lights: as a meeting of widely separated men, as a reunion of East and West, as a glance across the color line or as a sort of World Grievance Committee. Perhaps it was in part something of each of these. There was, however, one thing that this congress could do of inestimable importance. Outside the discussion of racial problems, it could make clear the present state of scientific knowledge concerning the meaning of the term "race."

This the congress did and this was its most important work. There were practically no reports of new anthropological knowledge. There were, however, several reviews and restatements in popular terms of the present *data* of the science in the matter of human races, exprest with a clearness, force and authority that deserve especial mention.

The scientific men who contributed papers to the congress, and who were with few exceptions there in person to take part in the discussions, were, many of them, of the first rank: Von Luschan and Von Ranke, of Germany; Sergi, of Italy; Myers, Lyde and Hadden, of England, and Boas, of America, are all well known; among the other speakers were the Indian scholar, Seal; Lacerda, of Brazil: Finot, of France, and Reinsch, of America. All those mentioned, save Boas, were present in person.

To realize the full meaning of the statements made by these men one must not forget the racial philosophy upon which America has long been nursed. The central idea of that philosophy has been that there are vast and, for all practical purposes, unbridgeable differences between the races of men, the whites representing the higher nobler stock, the

blacks the lower meaner race. Between the lowest races (who are certainly undeveloped and probably incapable of any considerable development) and the highest, range the brown and yellow peoples with various intermediate capacities.

The proofs of these assumptions have been repeatedly pointed out; the high civilization of the whites, the lack of culture among the blacks, the apparent incapacity for self-rule in many non-Europeans, and the stagnation of Asia. The reasons for this condition were variously stated: some assumed separate development for each race, while others spoke as tho the various races represented different stages in the same general development, with thousands of years between, the negro remaining nearest the ape, the whites furthest from the common ancestor.

Had these assumptions remained merely academic opinions it would not be necessary to recall them, but they have become the scientific sanction for widespread and decisive political action—like the disfranchisement of American negroes, the subjection of India and the partition of Africa. Under the aegis of this philosophy strong arguments have justified human slavery and peonage, conquest, enforced ignorance, the dishonoring of women and the exploitation of children. It was divine to enslave negroes; Mexican peonage is the only remedy for laziness; powerful nations must rule the mass of men who are not fit and cannot be fitted to rule themselves; colored women must not expect to be treated like white, and if commerce is arranged so as to make the dark world toil for the luxury and ease of the white, this is but the law of nature.

As I sat in the great hall of the University of London, I wondered how many in those audiences of five, six and seven hundred who daily braved the sweltering heat of a midsummer meeting realized how epoch-making many of the words quietly spoken there were, and how far they went toward undermining long and comfortably cherished beliefs.

The anthropologists were not rash in statement. They spoke with full realization of the prevalent attitude of Europeans toward other races. Some, like Von Luschan,. took pains to emphasize separate racial development for the sake of the "hassenkamf," but he began with the sweeping assertion that "mankind is one":

> "Fair and dark races, long and short headed, intelligent and primitive, all come from one stock. Favorable circumstances and surroundings, especially a good environment . . caused one group to advance more quickly than another."

Moreover both he and Von Lanke, Sergi and others ridiculed the possibility of a "science" of race, or, indeed, of the possibility or desirability of drawing complete racial lines: "The question of the number of human races," said Von Luschan, "has quite lost its *raison d'être,* and has become a subject of philosophical speculation, rather than of scientific research. It is of no more importance to know how many races there are than to know how many angels dance on the point of a needle!"

Especial insistence was made against regarding races as unchangeable accomplished facts; they were, in the words of Boas and Seal, "growing developing entities" and "the old idea of the absolute stability of racial types must evidently be given up; and with it the belief in the hereditary superiority of certain types over others."

This brought the discussion to the crucial point, for granted that human beings form a family thru which it is difficult to draw absolute lines, yet does not the present advancement of the various groups of men correspond on the whole with their physical characteristics? No proposition was more emphatically denied than this. In physique, said Seal, quoting Weisbach, "each race has its share of the characteristics of inferiority," and it is impossible to arrange the main groups of men in an ascending scale of physical development. Lyde, of Oxford, added that even color, which is today made the greatest of racial barriers, is with little doubt "entirely a matter of climatic control."

Nevertheless there are tremendous differences in the present condition of the various groups of men—whence do they arise and how permanent are they? Practically every anthropologist present laid the chief stress on environment in explaining these differences; not simply physical environment but the even more

important social environment in which the individual is educated. Von Luschan traced dark-skinned primitive man from Southern Asia to the negro and negroid toward the Northwest, the Indo-European toward the North and the mongol toward the Northeast. "We have thus the three chief varieties of mankind," he said, "all branching off the same primitive stock, diverging from each other for thousands of years, but all three forming a complete unity, intermarrying in all directions without the slightest decrease of fertility." Sir Harry Johnston emphasized this early interpenetration of primitive races and found traces of negro blood from Asia to Ireland. Others like Reinsch showed that the differences that arose among the scattered branches of men were due at first to physical environment, and pointed out the way in which the contrasting geography of Greece and Africa, and Europe and Asia had influenced the history of their inhabitants.

Had not this long difference of environment left traces in the characters of races so ingrained as to be today practically ineradicable? Myers, of Oxford, asserted, in answer to this, that the mental characteristics of the majority of Europe were today essentially the same as those of the primitive peoples of the earth; that such differences as exist are due to present social and physical environment and that therefore "the progressive development of all primitive people must be conceded if the environment can be appropriately changed."

From the papers submitted to the congress and from his own studies, Gustav Spiller, the secretary, stated that a fair interpretation of the scientific evidence would support these propositions:

1. It is not legitimate to argue from differences in physical characteristics to difference in mental characteristics.

2. Physical and mental characteristics of races are not permanent, nor are they modifiable only thru long ages. On the contrary they are capable of being profoundly modified in a few generations by changes in education, public sentiment and environment generally.

3. The status of a race at any particular time offers no index as to its innate or inherited capacities.

As to race mixture all the anthropologists said that there were no "pure" races and that modern peoples were all more or less mixt. Nevertheless while many of these mixtures were obviously beneficial, it was not clear whether all racial mixtures would be. Certainly it was unscientific to assert that mulattoes and Eurasians were degenerate in the absence of all scientific data. Lacerda, of Brazil, showed the high proportion of mulattoes in the population of Brazil and the leading rôle they had played in emancipating the slaves, in establishing the republic and in the literary and political life of the day. Sir Charles Bruce and Sir Sidney Olivier made somewhat similar statements concerning the West Indies.

It would be too much to say that all anthropologists today would subscribe to the main conclusions of those who attended the Races Congress or that the doctrine of inevitable race superiority is dead. On the other hand there is good reason to affirm with Finot, in the *brochure* which he gave the congress:

"The conception of races as of so many watertight compartments into which human beings can be crammed as if they were so many breeds of horses or cattle, has had its day. The word race will doubtless long survive, even tho it may have lost all meaning. From time immemorial men have taken far more pains to damn their souls than would have sufficed to save them. Hence they will be certain to preserve this most scientific term which incites to hatred and unjustifiable contempt for our fellow men, instead of replacing it by some word implying the brotherhood of man."

The congress itself recorded its judgment on the matter of race differences by

"Urging the vital importance at this juncture of history of discountenancing race prejudice, as tending to inflict on humanity incalculable harm, and as based on generalizations unworthy of an enlightened and progressive age."

# Trials of an Encyclopedist

BY C. M. FRANCIS

AS people have been constrained recently to read a good deal about a certain monumental British work of reference, it has seemed to me a fitting season to draw upon my own experience as an encyclopedia editor and present a few ingenuous and intimate reflections and some samples of my woes. From the advertisements one would never guess that encyclopedias are made by human beings. Nor does a casual encounter with encyclopedia editors, of whom fortunately there are very few, always carry a strong conviction on that point. I am myself aware of being badly damaged by my calling. I feel drier after twenty years of it than I believe I should have felt after an equal time at some more gregarious occupation, and I fancy other people sometimes find me even drier than I feel. Twenty years among the barebones of all subjects, and seeing the full rotundity of none, must surely leave its mark upon one. If it were a profession, it would be different. No one ever really means to be an encyclopedia editor. It merely happens to him. We do not hear children say they wish to be encyclopedia editors when they grow up. If we did we should probably punish them. No one ought ever to desire to be an encyclopedia editor. But tho a peculiar calling, segregating and to a certain degree dehumanizing, it is not nearly so bad as might be inferred from advertisements and editorial announcements. Behind those smooth absurdities there often lurk actual men, withered perhaps, but fellow-beings nevertheless.

And so far as there is any honesty in them they will not confound their miscellaneous and unassimilated information with true knowledge. Universality at the present stage of knowledge is a synonym for scatter-brains. Even in Diderot's time it was a doubtful compliment. No encyclopedia editor ever let so large a part of the work pass thru his own head as Diderot, and certainly no encyclopedia editor ever had such a fiery head. The result was that it was not an encyclopedia in the present sense but a huge polemical pamphlet. Its attacks on the existing order were covert and indirect, because it was under governmental control, but by subterfuge, veiled irony, secret thrusts, Diderot never lost a chance to insinuate the spirit that was to overturn the Church and State. As to his universality Diderot confest:

"I know indeed a great enough number of things, but there is hardly any one who does not know his own subject better than I. This mediocrity in all fields is the result of an unbridled curiosity and of means so straitened that I could never give myself up wholly to a single branch of learning. I have been forced all my life to follow occupations for which I am not fitted and to leave aside those to which my taste calls me."

Sainte-Beuve, to be sure, says of him that he showed so much genius in his many-sidedness that "one is tempted to believe that he best fulfilled his destiny in thus scattering himself." Nowadays Diderot's universality would be embarrassment. The modern editor is primarily an executive. His worth is in no wise measured by the span of his information —a narrow span at best. To know is impossible, but it is not impossible to know the men who should. Diderot's methods would ruin any modern encyclopedic enterprise. If I were a publisher I should distrust the omnivorous reader, still more a mind acquisitive of universal scraps. He would be more likely to consume the stock than organize it. He would be addicted to "drinking behind the bar." Giants of learning are not at the present time needed for the work For as Owen Meredith sang in lines too atrocious to be forgotten—

"A dwarf on a dead giant's shoulders sees more
"Than the live giant's eyesight availed to explore.

And I venture to say that a quite commonplace person, provided only that he had an open mind and plenty of time and money, could easily devise an encyclo-

pedia today that should surpass all its predecessors.

Diderot gave the keynote to the present encyclopedia title list and its scope. There is no such break between the French encyclopedia and its successors in these respects as divided it from those which went before. Every encyclopedia maker turns as a matter of course to the title list of his predecessors. That is the way to begin and there is no trick about it. People have often asked me how the editor knows what titles to select. They do not stop to think that the majority of subjects in any one encyclopedia are in all the other encyclopedias. The editor is forever poring over the title lists of his predecessors. He may combine them in a single list or card catalog. He may sift into it the title lists of special reference books, as dictionaries of architecture, music and mechanic arts, reader's handbooks, or titles from the indexes of special treatises, and his department editors or contributors will swell the list from still more special sources. But the bulk of the titles remains the same from decade to decade. The exercise of a rational judgment in selection is not the thing that surprises one who has seen encyclopedias in the making. The really amazing thing is their imitativeness and formalism. In every long-lived encyclopedia titles are carried for a generation for no other reason than that they have been found in some preceding work. There is hardly a page of any encyclopedia, even the best, that does not include matters of less significance than something which has been left out. In the department of biography, for instance, names of men and women are preserved merely as the result of the whim of some hack-writer long since dead. If the late Leslie Stephen, in his much respected "Dictionary of National Biography," had in a sportive mood written three pages apiece on six purely imaginary British worthies — invented their names, dates, the books they wrote, the offices they held, their birthplaces and burial-places — you would no doubt find them all in condensed form in the next edition of the "Britannica." At the next revision of "La Grande" they would probably appear in a concise French version and the indefatigable "Brockhaus" and "Meyers" would surely catch them up. Posterity would be certain to encounter some of them.

I myself as a hack-writer once invented a clergyman and watched his life, carefully prepared in the encyclopedic style appropriate to clergymen, pass thru the successive editorial stages. That his title to fame might pass unchallenged, I said he was the author of the well-known hymn, "Leap, Leap, My Soul." No one cared to admit that that hymn was unfamiliar. The article underwent the scrutiny of department editor, managing editor, editor-in-chief, and all the little sub-editors, and emerged unscathed; then it went into first proof, second proof, revise, and pages, and I pulled it out barely in time to save it from the plates. Otherwise he might have lived for fifty years in the hearts of his countrymen. After all it was as good a thing to pass on to the future as much that the encyclopedia editor transmits to it.

Hence to ask an encyclopedia editor how he knows what to put into his volumes is greatly to embarrass the poor creature. He does not know what to put in. He has his precautions, his more or less elaborate system of subdivision and of checks. He can say that a certain title was taken from such and such a source, that it was assigned to the editor or contributor-in-chief of a certain department, that it was written by him or one of his collaborators, that it passed thru the hands of a certain office editor whose duty it was to read all the articles of this and certain related departments, that the managing editor saw it, the editor-in-chief saw it, the editorial proofreader read it, and changed a noun from singular to plural, and the second proofreader read it, and caught two p's that were standing upside down. But he knows that many titles find their way into his work and into every other as the result of a foolish guess and that all conceivable safeguards can only reduce the damage done by routine thinking, credulity, somnolence, conventionality and imitativeness. Luckily for him encyclopedias are seldom criticised for this useless lumber. The great body of criticism is concentrated on omissions. Encyclopedia making is a form of journalism — ponderous and intermittent, but journalism

nevertheless. In order to tell people what they wish to know it casts its drag-net far and wide. Like the newspapers and magazines it tells a great deal that nobody wishes to know.

I know nothing of the peculiar problems that beset editors of dictionaries, encyclopedias of names, or special works of reference. I am speaking only of general encyclopedias, of which five have been my portion, all straining to be "universal" and one perishing miserably in the attempt, for lack of capital. In the course of this experience, one great difficulty has been the lack of intelligent adverse criticism. To be sure I have been aided by some censorious but able reviewers, who were willing to take pains in order to inflict them, and I recall one long, envenomed article which enabled me to revise an entire department to its great advantage. But in the press generally I have been insanely praised and so discouraged from doing better. Praise to an encyclopedia reviewer is the line of least resistance. To find fault he would have to read the text. Still the best criticism is to be found in the reviews. That which comes to the editor's desk by mail is not reassuring as to the alertness of the public mind. The greater part of it is local or trivial. A church steeple is ten feet too low. A Western railway is not long enough. Somebody's relative is omitted. Correspondents in the West seem particularly engrossed in the sheer size of everything, and the omission of any large object situated in or near a Western town angers the inhabitants exceedingly. It is far safer to blacken the reputation of George Washington than to forget their city hall.

To be sure I have been sometimes attacked on dogmatic or historical grounds. I have been accused of a deep-seated personal hatred of Ireland and of a determined purpose always to snub Australia. To state both sides of a disputed question fairly is not so safe as it seems. It angers the extremists on each side. It angers one party even to have the views of the other mentioned. State one side and the missiles all come only from the other. State both sides and you are exposed to a raking cross-fire from each. Nor is peace maintained always by preserving a mild demeanor. If you are calm you are sometimes doubly provocative. Many people lose their tempers merely from seeing you keep yours. "You are incapable," wrote one accuser, "of an honest statement of plain facts," and then substituted a new and hitherto private history of the heavens and the earth. I have learned to regard with suspicion anyone who inquires vehemently "What are the facts?" That outward devotion to fact seems to increase with the power of misstatement and it is a safe rule for an editor on reading a prefatory eulogy of truth in general to brace himself for some giant falsehoods in particular. The most touching tributes to historical fact that I ever received as editor came from a mad Mullah in one of the wildest parts of Boston, and truth took on all the colors of the rainbow in the very letters which praised most eloquently its pure white light. There is nothing stubborn about a fact. It is a time-server and a lickspittle and whenever it meets a fool it is ready to lay down its life for him. It will do so sometimes for a genius. "It is my stern desire," said Ruskin, in one of his delightful letters to Mr. Norton, "to get at the pure facts, and nothing less or more, which gives me whatever power I have." Accordingly our Civil War was to him "a squabble between black and red ants," and Cervantes and Dickens were merely "mischievous," and Sainte-Beuve was a hopelessly "shallow" creature, and so on thru a thousand charming vagaries (sternly pursued as "facts"), till he became quite mad, still convinced that he was merely judicious. When reason dies in a great man, it is the iridescent death of the dolphin, and nobody need complain, but the hallucinations of my dogmatic correspondents were generally rather humdrum, no more picturesque than facts.

On the whole, however, the editor has little to fear from the *odium theologicum*. We are so used to free thought that restraint is hardly imaginable. It is not easy to picture Diderot with nine censors placed over him, "one of whom must be an orthodox theologian." The only tyrannical laws in these days are those of demand and supply. Still it does seem rather remarkable that the people themselves are so good-natured as a

rule. Sects that presumably would desire proselytes or at least wish to defend themselves are in the main quite unconcerned with the statement of principles that undermine their foundations. The Catholic Church is, as it always has been, the most alert; but in this country at least it does not do much to stifle heresy at its source. I remember years ago writing a school history intended for the use of both Catholics and Protestants. The publishers impress on me the importance of presenting both sides fairly. Accordingly, as I was reared in the Protestant tradition, and knew very well that I could not help inclining to that point of view, I determined to seek counsel of the Jesuits. I submitted the proof to a Jesuit father, the head of a well-known American seminary, and in a conversation with him afterward. warned him against the inevitable Protestant bias of my work. But what did he, breathing the latitudinarian air of this country, care for a Protestant bias? His suggested changes pertained, as I recall, to a few phrases about Tetzel and the Sale of Indulgences. Yet at a hundred points the book showed a spirit utterly at variance with Catholicism. It has been much the same in editing encyclopedias. I have courted the criticism of both sides. Neither has seemed to care very much. I have taken the utmost pains to submit articles on delicate doctrinal points to both Protestants and Catholics, only to find on each side a weary and flaccid acquiescence. I have found the Jesuits more wide-awake than others. Yet they, as a matter of fact, questioned only the most obvious points—as in the case of that historical text-book. And this, tho we all know that a Protestant or Roman Catholic color runs all thru modern secular history in matters remote from definite doctrines. There is, of course, a Catholic and Protestant view of the modern world. As Bishop Stubbs has said, history cannot be written later than the fourteenth century. All that follows is subject of present-day religious controversy.

We laugh at the Middle Ages for applying the test of orthodoxy to every branch of learning—an heretical or orthodox astronomy, a blasphemous view of the solar system, an irreligious physical law. I hazard the question whether we have not gone to the opposite extreme. We play at ostrich with one another. We hide one portion of our intellect from the rest. We profess a principle of faith that makes our scientific teaching ridiculous, and we accept as a matter of course scientific theories that would blow our churches into the air. We call it practical—this intellectual hide-and-seek. As a matter of fact we prefer not to know what our minds are up to.

It is not so strange that we are constantly doing these things as that we are so complacently unconscious that we are doing them. It is hard to blame those reactionaries who revolt against our self-important modernity. For after all we do know that the joke on human nature is more or less permanent, that persecution was at least a sign of personal interest, and that tolerance is often composed nine parts of apathy to one of brotherly love. It is inconvenient to think where our principles lead. Once I found on the margin of a seventeenth-century treatise on mathematics the exclamation in bad Latin of some monkish reader: "Damn Luther and Melancthon and all who think as they do." It was hard to trace these heresies in the text or account for his explosion. But nowadays Christianity and its refutation often dwell together in perfect amity in the same mind. People make up little nosegays of doctrines for themselves out of the New Testament and Haeckel. I am not deploring the decline of bigotry. I am merely wondering, as many others are, how far it has been replaced by the religion of sloppy-mindedness.

Of course the direst problem of all is presented by modern specialism. The aim of the French Encyclopedia, as set forth in its prospectus, was to serve as a reference library for every intelligent man on all subjects save his own. That has remained the aim of general encyclopedias ever since. But tho the topics of a given science cannot be written for specialists, they must either be contributed by specialists or rest on their authority. Any good encyclopedia will carry specialization to the furthest point that is possible without sacrificing the interests of the layman. He is supposed to be a

rather robust and intelligent layman willing to take some pains. The encyclopedia is not intended to wheedle an unwilling layman or boost a feeble one, and without some very formidable technicalities many subjects could not be treated at all. All that can be done is to try and avoid unnecessary technicality. It is a question of balance and degree and the whole matter is at the mercy of the personal equation—of many personal equations. That is why it is so hard a problem. If one could find men of the Huxley type for every science it would be easy. Huxley liked to think himself a specialist. He called himself the "Reverend Father of Worms and Bishop of Annelida." But he elsewhere gave himself a better title—that of "something between a gladiator-general of science and a maid of all work."

Huxley's mind would often wander gladly far from worms. Nowadays the man of worms is homesick when away from them. He is moreover disdainful of all elements that are accessible to laymen. He calls it popularizing to mention them. Popularizing has a bad name with specialists and they include in it almost every means for the diffusion of knowledge. There is much to justify their contempt. Making things "readable" is often synonymous with making them silly.

Hence the embarrassment of the middleman of information, the encyclopedia editor, vibrating between specialist and layman, an object of suspicion to both. I am snubbed by the learned and yet not welcomed by the totally illiterate. It may be merely an accident but somehow I have always fared the worst among zoologists and botanists. Naturally, an editor of an encyclopedia cannot have a sub-editor for every animal, but that is what the zoologist apparently expected of me. Matters are far worse than in the days of Dr. Holmes's naturalist who flew into a rage because some one called him a Coleopterist. He was no smatterer, he said, trying to spread himself over the Coleoptera; he was a Scarabæist. Nowadays a zoologist seeks out his animal in early life and henceforth stays with it. Often the intimacy between them is so great that it seems indelicate to intrude. I have known a bivalve and a man to develop interests in common so exclusively molluscous or bivalvular that no human being dared break in. When I tried to organize a department of biology, I soon found that it was impossible to thresh the matter out by correspondence. No one cared to be superficial enough to take charge of any branch of that subject, to say nothing of the whole. No man would leave his insect for that foolish, scattering popular subject, entomology. So one day I went to Washington, where biologists, I understood, were very thick and tame; and I had myself put up at a certain learned club, which seemed to be a sort of runway for biologists, where the layman might watch them as they came to drink. I have counted eight or ten distinct and mutually unintelligible varieties in the same room at once.

But when I came to meet them it was no easier. It was impossible to get the mosquito man away from his mosquito, the fossil horse man would not dismount, and the fish people, tho kind, were firmly fishy. Day after day I was passed from one kind of biologist to another. With botany it was no better. Why think of so broad a subject as vegetable physiology, if the vegetable physiologist could not be torn from his potato? I did not know beans about botany. They introduced me to the kind of botanist who knew only beans. At length one man stooped so far as to help me with a plan, but it involved a subdivision of zoology into thirty departments with no one responsible for the whole. Less specialization than that would, he said, be vain and shallow. This would have left me alone to drive that herd of thirty rearing and plunging zoologists. I left Washington and again had recourse to correspondence. I wrote many letters, full of an Oriental flattery that I had learned as a layman addressing specialists. Finally a man agreed to take charge of the department. It was understood that he might gather about him all the zoologists he could find, but that he must be responsible for the whole department. He carried the work half thru, then forgot it and sailed for Europe, chasing some insect, I suppose. In his absence I fell into the hands of a group of zoologists whose eccentricities were scandalous. Part of

the work had to be done over twice; part of it three times.

This illustrates the difficulty of making the knowledge of specialists available—not alluring, or exciting—but merely available to intelligent persons, even to persons of their own size, but of unlike experience. It is hard to convince many of them that the work is worth doing. It is a natural feeling but it is indulged to a point where it becomes a vice. At the one end we have the yellow journal, at the other, the doctor's dissertation. One road leads to Hearst and the other to Dryasdust. It is a pity that either must survive. It is not the aim of an encyclopedia to do away with technicality or complexity, but only with that portion of it which inheres not in the subject itself but in the muddle mind of the man who writes about it. There is no less pedantry today than there ever was, and clarity of expression is no more common. Hence the need of encyclopedists and such small deer, of universal dunces like myself, to remove unnecessary difficulties. Never in the world will special reference works, or specially arranged libraries, suffice.

NEW YORK CITY.

# Mexico's Political Situation

BY CHESTER T. CROWELL

[Mr. Crowell has been in active journalism in Mexico City, and has but recently returned to Texas, where he is now managing editor of the Austin *Statesman*. Our readers will recall several other articles from his pen during the recent crisis.—EDITOR.]

FROM the most applauded hero of Mexico, during recent times, Dr. Francisco I. Madero has become nothing more than one of a group of candidates for President. At the time of his triumphal entry into the City of Mexico, the mere suggestion that any but he could be a candidate for President would have been laughed at and hooted. Today, there are four candidates in the field. The sturdy anti re-election clubs which first nominated him for president, and among whose members his best following was to be found, have shifted their support to Dr. Francisco Vasquez Gomez. Dr. Madero refers to this loss as an unimportant incident, when, as a matter of fact, it is the most significant occurrence in Mexico within the last sixty days.

The cause of this organization's selection of a different candidate furnishes an interesting comment on the game of politics as Dr. Madero plays it. Since there is no longer any reason for anti re-election clubs with Porfirio Diaz driven from the president's chair Dr. Madero formed a new organization, the "Progresistas." The word anti, of course, suggests that the organization is opposed to something which still exists and objection to the name is valid. It would have been a good plan to change the name of the anti re-election clubs. But, instead of doing that Dr. Madero proceeded to organize a new party with a better name and offend and divide his following. Small as this cause of division seems, it would probably be sufficient in any political campaign to cause trouble, and, even tho Dr. Madero may bring a large part of his following into his new organization, he has lost strength which he formerly had and furnished the basis for the candidacy of another man who would have been his warm supporter as a candidate for Vice-President.

Dr. Vasquez Gomez is not a man to be laughed at; his work for the revolutionists was about the only conspicuously brilliant work done. He managed their diplomatic affairs and publicity campaign excellently and he had a personal following before the revolution began. He knows how to play politics well enough to add steadily to his strength as the campaign progresses and whatever strength he gains will be Dr. Madero's loss.

In all probability, the old conserva

tives who pine for the days of the Diaz regime will line up behind Bernardo Reyes, who was the faithful friend of President Diaz and showed himself on more occasions than one to be more patriotic than selfish—something rare among politicians in Latin-America. Reyes has a tremendous personal following, among all classes.

The Roman Catholics also have a candidate in the field. There is not much probability of a candidate backed by the Catholic clergy being elected to the Presidency of Mexico, but it is certain that such a candidate will have a strong and numerous following which will come for the most part from the ranks of the Madero sympathizers.

Altogether it appears, at present, that the election of Bernardo Reyes is just as probable as that of Dr. Madero. This situation is indeed remarkable when one considers that Dr. Madero served on the field of battle and gave his own money to finance the revolution while Reyes spent those troublous days in Europe on an expense account from the Diaz government.

When the recent revolution began, I ventured to predict failure for it because Madero is a man of such limited executive and military ability. A series of circumstances and the popular verdict against re-election of Diaz in the face of his assertion that he would not be a candidate in 1910, brought victory to the banners of the revolutionists. I then questioned the ability of Dr. Madero to hold his popularity until the election in October. Bernardo Reyes returned to Mexico immediately following the tremendous ovation to Dr. Madero on his entry into the City of Mexico. Reyes' own reception in the capital was cool. If he had not observed a change since his entry he would not now be a candidate, because he was not a candidate at that time and declared he would not be, going even so far as to let it be generally known over the country that he would accept a position as minister of war in Dr. Madero's cabinet following his election, which was assumed to be certain.

Dr. Madero is a good man and an honest man. He is undoubtedly the peer in honesty of motive and patriotism and progressiveness of any public man, today. But, being now in politics, he should be at least politician enough to hold his own following, tho it must be admitted that this is no easier in Mexico than elsewhere.

The president of any Latin-American country must care for his supporters and friends from the public treasury. The revolutionist who expects a following must promise lucrative positions. They have done so for so many years that the promise is now assumed. So long has it obtained as an unquestioned rule, that the most patriotic soldier, willing to die on the battlefield or to have his home burned by the enemy, would expect a good position, probably even a sinecure, if the revolution were to succeed. The Mexican revolutionists who fought under Madero want him to look after their interests, now; and he doesn't seem particularly disposed to do it. Revolutionist soldiers have been paid their wages and dismissed. Many of them were so incensed at this that they resisted attempts to disarm and battles resulted. It was also displeasing to them to have to surrender their arms to federal soldiers, in many instances. They were victors, yet commanded by their general to lay down their arms before the defeated enemy!

One series of riots and disturbances has followed another in Mexico since announcement was made that the revolution had come to a close. On each occasion Dr. Madero goes to the scene of trouble and makes a speech—what Americans would term a "Fourth of July oration"—and the disturbance ends. Mexicans have a keen appreciation of lofty sentiments such as animate Dr. Madero and nothing stirs them like a wholesome speech well delivered, but speeches do not end the underlying dissatisfaction. Thus Dr. Madero has been gradually losing strength ever since his triumphal entry into the City of Mexico.

Dispatches from Mexico to the effect that business conditions are improving rapidly and will soon be normal again are fabrications out of the whole cloth. Business is utterly stagnant and has been for months. In some of the large cities the American colonies of scores or hundreds of families have practically disappeared. Mines are closed for an indefi

nite period or work has been suspended pending repair of damage to machinery or railroad lines. Conditions in Mexico are not likely to show much improvement until after the general election in October. And then it is to be expected that the improvement will be only gradual.

If Dr. Madero could have kept his formerly unquestioned leadership in national affairs and put an end to the political turbulence, he would have done a great service to the country. As it is, all is unsettled, even the outlook for peace.

Reports of little battles and of new revolutions begun by 100 to 500 men continue to come in. These combatants who are still occasionally interrupting train service and hurting business to no purpose are part of the revolutionist army which fought the federals without knowing what Dr. Madero and his men were fighting about, or caring. They term themselves Maderistas, nevertheless, and then wonder why the success of Madero has not made him President and effected the little State and municipal reforms for which many of these men are still fighting. Thus, the country sees Maderistas going out to capture other Maderistas, or federals with the moral support of Dr. Madero going out to capture the very men who, six months ago, were fighting his enemies.

What Mexico needs, now, is some man so strong that his leadership would be unquestioned. If Reyes is elected he will be that man, but he is not progressive, tho he is honest. Dr. Madero, if elected, will probably eventually precipitate another revolution. Dr. Gomez would make an excellent tho not a brilliant President. There is no chance for anyone else.

It is greatly to be regretted that Francisco Leon de la Barra, provisional President of Mexico, cannot enter the field. He is the most promising presidential material now upon the stage of Mexican political affairs. He would immediately command the support of those who still think kindly of the old Diaz régime and a great many of Madero's supporters. He would especially have with him the progressive and educated young Mexicans who hope to be the salvation of their country. He would make an excellent President and his opportunity to play a more important part in the affairs of his country is undoubtedly yet to come.

# The Passing of English Republicanism

BY EDWARD PORRITT

Author of "The Unreformed House of Commons," "Evolution of Home," Etc.

FORTY-FOUR years ago, when John W. Forney, who was then Secretary of the Senate of the United States and proprietor and editor of the *Philadelphia Press* and the *Washington Chronicle*, was in England, he wrote from London a series of letters to his newspapers which for insight into political and social conditions in England have not been surpassed by the letters of any American who since that time has been there on a similar errand. In one of these letters, dated May 21, 1867—and written while the second great reform bill was before the House of Commons—Forney summed up the attitude of the English people toward the Crown. "The English," he wrote, "are singularly loyal to their sovereign, and proud of their renown as a nation. It will be some generations before they decide upon the experiment of a republic, unless they are hurried into another revolution by the blindness and vices of their rulers." A similar prediction might have safely been made by any American who was in England during the coronation celebrations; for today there is even much less popular sentiment in favor of a republican form of government than there was when Forney was in London, looking on at the enactment of the first measure that con-

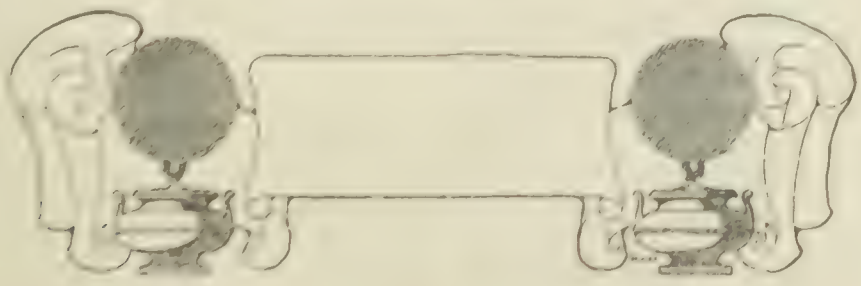
ferred the vote on any large number of the working classes.

Long before Forney was in England, and for some years after his visit, there was a diffused popular sentiment in favor of a Republic. Its existence can be traced as far back as the second decade of the nineteenth century—the decade when the economic and social condition of the common people was more deplorable than at any time since, in the reign of Elizabeth, feudal serfdom entirely disappeared from English life. This Republican sentiment was attributable to social conditions and to the new serfdom of the first half century of the industrial revolution, and also to the contempt in which George IV and William IV were held by all classes—working, middle and landed. There never was a time when the Crown was less prized, or of less use to the nation, than from the Regency in 1809 to the beginning of the reign of Queen Victoria. Two more sovereigns of the type of George IV might have brought England very near to a Republic; and, as it was, the Republican sentiment born of popular contempt for these sovereigns, survived almost until the first jubilee of Queen Victoria in 1887.

Its greatest strength in the reign of Queen Victoria grew out of the poverty and misery of the common people which continued long after 1837, and also out of the failure of the Chartist movement in 1848. To the Chartists it seemed in 1848 that all the great popular agitation of the eight or nine years before the collapse on Kennington Common had availed nothing. The men in the movement could not then realize how much the Chartist movement had done for popular political education. To the Chartists of 1848 all seemed to have ended in failure; and out of the failure came a recrudescence of the Republican movement that had had its origin in the decade after Waterloo.

There never was in the House of Commons or in the constituencies, a Republican party in the sense that there are today Liberal, Conservative and Labor and Socialist parties. But between the collapse of the Chartist movement and the extension of the Parliamentary franchise to the working classes in rural England in 1884, there were hundreds of Republican clubs scattered all over the country; and three avowedly Republican weekly newspapers—*Reynolds's News*, the *National Reformer*, and the *Republican*—were published in London. The movement attained its great prominence between 1870 and 1873. Dilke was then in open sympathy with it, so was Chamberlain, and so were Joseph Cowen and Auberon Herbert. During the Parliamentary recess of 1871, Dilke made speeches up and down the country in favor of a Republican form of government; and in the Parliamentary session of 1872, he shocked Gladstone and the Whigs and Liberals by moving for returns showing what royalty cost the British taxpayer. Gladstone was Premier at that time; and as leader of the House of Commons he opposed Dilke's motion with much vigor and even more heat. But the motion was seconded by Auberon Herbert, who uncompromisingly declared himself a Republican. With a seconder thus forthcoming, the House was compelled to divide. The Government whips told against the motion; Dilke and Herbert told for it. Only two members, however, voted with Dilke and Herbert. One was the late Sir Wilfrid Lawson who thirty years later, in reviewing his long service in the House of Commons, justified his vote. "I think," he wrote, "my vote was quite right; for the returns asked for by Dilke were due to the country, and Gladstone did not at all benefit the monarchy by withholding them."

This was the first and only time in the nineteenth century that Republicanism was discussed in the House of Commons. The discussion was a failure; but it certainly stimulated popular interest; and in 1873 there was a National Republican Congress at Birmingham. Eighteen hundred Republican clubs are said to have been represented by delegates at this congress, which was the last popular demonstration in favor of the Republican idea. The Republican newspapers survived as such for some years after the Birmingham congress, and Bradlaugh and other Republicans continued to write and lecture in favor of Republicanism. But the lectures gradually lost their vogue; and in 1897—the year of Queen Victoria's second jubilee—one of



Bradlaugh's old colleagues in the Republican movement, who is now of the House of Commons, made the statement that there was not a single Republican club or newspaper in existence. Today in this year of King George's coronation, the subject has not even an academic interest; and fond as the English are of political discussion an orator speaking from a soap box could not hold the attention of twenty people for five minutes by a speech urging the substitution of a republic for the monarchy.

At least four obvious reasons for the complete disappearance of the Republican idea would suggest themselves to a Forney who was in England today. The last two sovereigns—Queen Victoria and King Edward—were immensely popular; and King George, with the aid of Queen Mary, seems likely to be equally so. The English working classes since 1884 have been in possession of the Parliamentary vote. A great increase in popular political education has resulted from the elementary education act of 1870 and the extension of the franchise in 1884; and with education and the exercise of the franchise, there has gradually come to the working classes a realization of two important facts. These are that the sovereign since Queen Victoria's time does not stand in the way of progress toward democracy, or of constitutional changes giving increased power to the people; and the working classes thru their votes are able to achieve reforms of more consequence to them than the substitution of a republic for the monarchy.

Better even than Canadians, whose constitutional and Parliamentary machinery is more democratic than the English; better, it may almost be said, than Americans, the English people realize what can be done with their constitutional and Parliamentary institutions; and it is because the English working people realize how much can be done with existing political machinery—national and municipal—that the question of a republic versus a monarchy has no longer even a debating society interest. English people are essentially practical in their politics. Proof of this is forthcoming in abundance in a survey of the social and economic legislation for which both the older political parties are responsible since the working classes all over the country were brought within the Parliamentary system twenty-six years ago.

For eighty years the bulwark against democracy in England has not been the Crown. The Crown has accepted democracy as far as it has gone and adapted itself to it. The bulwark against democracy since 1832 has been the House of Lords, and the enormous increase in the titled territorial aristocracy by which the House of Lords has been reinforced. This increase has resulted from the great fortunes made in manufacturing, brewing, mining and transport. In theory the Crown is responsible for these new creations of peers, and this extension of feudalism; in reality Cabinets are responsible and not the Crown. The working classes understand where responsibility for the growth of this new feudalism lies, as is evident from the part that the Labor group in the House of Commons has taken in the curtailment of the powers of the House of Lords effected by the Veto Act. The Crown, as has been said, accepts democratic progress; and so long as it thus accommodates itself to new conditions, the time will be remote when the English people will be driven into revolution by what Forney described as "the blindness and vices of their rulers."

HARTFORD, CONN.

# Heredity and Its Laws

BY VERNON L. KELLOGG

[Professor Kellogg is one of the leading entomologists of the country, and has written much on the problems of heredity. His most popular works are "American Insects," "Insect Stories" and "Darwinism Today." In the following pages he discusses some of the questions of evolution which have come to the front since the time of Darwin.—EDITOR.]

OUR neighbors' child has red hair. Why? Because her father has red hair; she gets it from her father. Yet in the next block down the street is a red-haired little girl whose father's hair is not red. But her mother's hair is; *she* gets it from her mother. But across the street is a third little damsel of auburn locks, and neither her father nor mother is red-haired. Oh, well, she gets it from some grandparent, or, maybe, great-grandparent. Indeed, a boy friend of mine with hair aflame as a sunset sky has to trail back thru five generations of ancestors before he can find on either side of the house a red-headed ancestor. But he finds him, and so this mystery of inheritance is solved. Or rather, of course, it isn't, but some way it seems to be. If we can but find the prototype of the character in some ancestor, however far remote, we let this finding satisfy our eager curiosity as to the means of acquirement of our special sort of nose or eyes or hair. And this is simply the homely everyday application of Francis Galton's "Law of Ancestral Heredity," the first of the great generalizations, rather loosely called biological laws, concerning the method or course of heredity.

Heredity may be looked on as an unknown force or controlling influence which, in the presence of suitable extrinsic conditions, initiates, maintains and directs development, its rule only disputed by an equally unknown opposing force or influence making for variation; or it may be looked on as the set or series of phenomena, very complex, but all inter-related and interdependent and occurring in regular order, which compose development. That is, we may use the word heredity to refer collectively and descriptively to a set of phenomena, or to refer to a force peculiar to the living world, which under favorable physico-chemical environment produces the phenomena. In either case the outcome is that result of the development from egg to animal familiar to us all: the production of a new mature organism more or less nearly identical with the parent or parents from which came the germ cell that the development proceeds from.

Specifically the problem is, why and how does the germ cell develop into an organism, and why and how into one nearly like its parent and one wholly like its race. The "how" in this double question has been answered with certainty in minute detail and completely for many organisms, and with certainty in general outline for most organisms if by "how" we refer to the actual course of growth and changes characteristic of development. This developmental course or embryology of many animals and plants is recorded in our numerous textbooks, manuals and papers on descriptive embryology. "Why," that is by virtue of what physico-chemical and mechanical forces and inherent and extrinsic factors and stimuli, this development follows actually the path it does in any particular case, has, however, had so far only very incomplete attempts at answer and these fragmentary answers are by no means the result of a general agreement among biologists. The incomplete answers offered reveal two different general positions or attitudes with regard to the problem. One view is that the development is due to and controlled by capacities and conditions inherent in the germ plasm; the other, that it is the result of external conditions and influences brought to bear on the germ cell and developing embryo. The first view is called the *preformation* or evolution theory (using the word evolution without reference to its general application to the theory of descent, but technically with regard to its meaning of unrolling or un

folding), the second the *epigenetic* theory.

The preformation theory of development and heredity puts a great responsibility on the germ-plasm. To explain the course and outcome of development, on a physico-chemical basis, by this theory, demands an organization of the germ-plasm of great complexity and of precise definitiveness. It requires an ultimate structure of the germ-plasm which is as yet by no means revealed to us by our microscopes or by any physical or chemical tests, but is so far simply imagined or conceived for the sake of grounding a satisfactory hypothesis to explain protoplasmic capacities. It requires a sort of biological atomic theory. But even when we have conceived the germ-plasm to be made up of myriads of minute structural life-units, and have attributed to these micromeres a definite representative character, i. e., each micromere to be looked on as the ultra-microscopic but tangible representative of some one cell or kind of cells or other elementary characteristic of the parent body, is this sufficient? This supposed organization really reminds us very much of the old, absurd, encasement theory. For while the germ cell is not now supposed to contain a miniature, completely formed new organism, it is, by this preformation theory of germ-plasm organization, supposed to contain material minute representatives of each part of a complete new organism, all ready, and all arranged with regard to each other, to develop promptly and straightforwardly into this new creature when the moment of stimulus comes and the necessary food and warmth and moisture and protection are at hand. But is this perfect organization, this pre-formation, by representative life-units, of the new organism enough to explain heredity? Where are the dynamic and regulatory forces which shall produce and arrange and rearrange with absolute precision in the exact order of time and position all these representative parts?

Let us look to the other, the epigenetic theory. The epigenesists hold that the plasm of the germ cell is not so composed of representative micromeres arranged in definite organized relation to each other: that there is no preformation in the germ cell of parts or regions corresponding to definitive parts or regions of the future organism. The germ cell is composed of indifferent plasm, endowed by its parent only with a capacity to react to extrinsic conditions and influences in such a way as to develop into the likeness of the parent. The stimuli and the actual pushes, pulls, attractions and repulsion, of extrinsic substances and forces, and of the successively developing parts of the embryo itself are to be the control and regulator of the development. But is this sufficient? There are lacking in this theory not the dynamic influences, but the physico-chemical explanation of why of two tiny clumps of unorganized germ-plasm, one develops under extrinsic influence into a robin, and the other under practically the same influence into a wood-pecker. Development is better explained perhaps by epigenesis, but heredity better by preformation. Obviously, the theories may be merged, and that is the actual position of most present-day biologists. The mechanics of development are thus to be explained chiefly by extrinsic influences: the heredity of repetitional quality in it chiefly as due to intrinsic influences, i. e., to conditions inherent in the plasm of the germ cell. But the most ingenious and wisest explanation yet offered, consonant with all actual facts which the prolonged and careful study of the phenomena of development and heredity has so far revealed to us, stops much short of being a satisfactory mechanical explanation of the result or outcome of this development and heredity as we see it is in its totality.

If we are so far balked in our attempts to explain the marvel of the capacity of the germ cell and the phenomena of embryology, we might do well to look to the actual results of development and heredity and see if we can distinguish in these results anything that may enable us better to understand the processes that produce such results. What things are characteristic of heredity as exhibited by results? Are there not characteristics and phenomena which can be tabulated and compared? Will not the comparative examination of the results of heredity in different individuals, different kinds of organism, give us some new

kind of data of facts which may help in our attempts at solving the general problem? Just this sort of investigation has been made to some extent, two attempts to formulate the "laws" of heredity based on this kind of evidence being particularly conspicuous, viz., those of Francis Galton and Gregor Mendel respectively.

When we say that, thru heredity, the offspring inherits the characters of the parent, we are speaking only a large and general truth. The details of this inheritance reveal in what regards this general statement must be modified. We have already noted the inevitable occurrence of at least small variations in all body parts in all individuals. In addition to this exception to identical inheritance certain characters of the parent may not appear at all in the offspring. And this may be due to any one of several causes.

First, certain parental characters apparently are really not heritable, namely, those new characters which have been acquired by the parent during its lifetime as the result of mutilation, disease, special use or disuse of parts, any change due to direct reaction to a functional or an environmental stimulus or cause, such as a bleaching due to lack of light, a thickening of the skin in certain places due to contact, etc. At least, there is not recorded any satisfactory proof of the inheritance of these acquired characters, and there is definite proof that many of them are not inherited. And most biologists, as helpful in many ways to a clearing up of the problem of adaptation and species-forming as the actuality of such inheritance would be, believe themselves unable to accept this as a fact, in the light of our present knowledge.

Second, certain characters peculiar to sex are inherited only according to sex and not by all the young. These characters include not only the differing reproductive organs themselves but those many, various and often most remarkably developed so-called secondary sexual characters, such as the tufts and plumes and brilliant plumage of male birds, the antlers of male deer, the specialized antennæ, skeletal processes, and color-patterns of many male insects, and the reduced wings of many female insects, etc., etc. Even in cases of parthenogenetic reproduction, i. e., reproduction in which the male takes no part, sex and the sex characters of the offspring have no direct relation to the sex and sex characters of the mother. The queen honey-bee produces, in fact, exclusively drones (male bees) when she lays unfertilized eggs, while on the contrary the parthogenetic offspring of the aphids (plant-lice) are all females for several generations, and then in a single generation both males and females.

Finally certain parental characters, even tho congenital, *may* not appear in the offspring, but be inherited by them in latent condition to appear in their young or perhaps even in a later generation. It is obvious too, that where a certain character in the mother is represented in the father by one of opposite condition, as where the mother is very short and the father very tall, or the mother a brunet and the father light-haired, a given child can inherit the character in only one condition. That is, in all cases of bi-parental reproduction, and they compose the majority of cases in both animal and plant kingdoms, the inherited characters cannot be *all* those possessed by both parents, but must be either those of one or the other, or a coarse mosaic of them, or a blend or fusion (fine mosaic) of them. The similarity or dissimilarity of the two mating parents is a matter of much importance in regard to the results of inheritance. To produce a fertile mating the two parents have at least to be nearly allied.

Galton's Law of Ancestral Inheritance may be stated in few words, altho for an understanding of the character of the evidence on which it is based, and for an appreciation of its full significance some detailed account of it, preferably Galton's own statement and discussion of it in his memoir entitled "The Average Contribution of each Several Ancestor to the Total Heritage of the Offspring," published in 1897, should be read. From a study of the carefully kept pedigree book of the kennels of the Basset Hounds Club with records extending thru twenty-two years, and a study of inheritance in the British Peerage made possible by the complete genealogic records kept for these families, together with a consideration of various other less

detailed but at least helpful records of inheritance, Galton formulated the statement that any organism of bi-sexual parentage derives one-half its inherited qualities from its parents (one-fourth from each parent), one-fourth from its grandparents, one-eighth from its great-grandparents and so on. These successive fractions whose numerators are one and whose denominators are the successive powers of two added altogether equal one or the total inheritance of the organism: thus $1/2+1/4+1/8+1/16+1/32+1/64 \ldots = 1$. The English mathematician and natural philosopher, Karl Pearson, has made computations showing that Galton's law thus simply exprest is only a close approximation to the actual inheritance relations, and that the fraction indicating the contribution of any given ancestor must be slightly modified by introducing into it another factor. In general, tho, the Galtonian formula received a very general acceptance among biologists. And only recently, in the light of the discovery of Mendel's investigations and conclusions and their confirmation in essential principle by the recent researches of various botanists and zoologists, has Galton's law been looked on as altogether too simple and incomplete a formulation of the facts of inheritance. It is not yet quite certain whether Galton's formula is consonant with the Mendelian formula or not. But at best Galton's law only expresses a part of what may now with confidence be said to be known of the regular course of inheritance.

Before taking up the actual Mendelian results and conclusions, it is important for us to note the different modes of inheritance which characteristics may show in their transmission. Cuenot has made a rough but suggestive classification of these inheritance categories as follows:

In cross-matings and by "cross-mating" students of heredity do not necessarily mean mating between distinct species or even varieties, but mating between parents which disagree in the condition of one or more specifically referred-to characteristics—in cross-matings between the parents A and B, if we consider a single pair of corresponding characters *a* and *b* which differ in the two parents, the young produced by the crossing may (1), *all* present the same parental character *a* without any trace of the character *b*, the character *a* being then termed *dominant* or prepotent or prevalent, the other *recessive* or latent, or (2) the young may all agree in presenting a new character differing from the parental characters *a* and *b*, this new character apparently being a simple physical mixture or a real chemical combination or blending of *a* and *b;* or (3) the young may differ from one another in regard to the parental characters *a* and *b*, some showing the character *a*, some showing the character *b;* or (4) the young may differ among themselves in regard to the characters *a* and *b*, and some showing the character *a*, some the character *b*, and some a character or various characters intermediate between *a* and *b*, or (5) the young may show the characters *a* and *b* side by side in each individual in small separated parts, even in neighboring but distinct cells. These differences undoubtedly depend partly on the nature of the characteristics themselves, partly on the kind of organism and partly on extrinsic influences. It is obvious also that for certain characteristics by no means all five of these ways are open. Many characters are so wholly antagonistic that no blend nor any mosaic of them can occur in a single individual, leaving only ways 1 and 3, viz., exclusive or alternative inheritance, open to them.

To these five general categories of the actual transmission of certain obvious parental characters, may here be added for consideration those cases of the appearance in the young of a character or characters having no obvious relation to either *a* or *b*, but sometimes explicable as reversions or reappearances of characters possessed by ancestors more or less remote of the young, and other times as obviously wholly new and heretofore never existent characters which, if pronounced, are called "sports" or sudden or discontinuous variations. Also, and in the light of the observations and experiments of de Vries, of great importance in any consideration of the phenomena of heredity and variation in their relation to species forming and evolution, must be taken into account the possible appearance among the young of a few

to many individuals showing many simultaneous, usually slight, but real and immediately heritable differences from the parents in various parts and functions, which are the differences called mutations by de Vries and his followers, and which are the basis of the at present considerably accepted theory of species-forming by heterogenesis or sudden complete fixed modifications of organic types.

The Mendelian "laws" apply only, probably, to certain particular categories of inheritance, or rather categories of characters. That is, so far as worked out the Mendelian principles seem to have definite application only to cases of inheritance in which the characteristics under observation are mutually exclusive or alternative in character: categories 1 and 3 in our list in the preceding paragraph are the only ones plainly under the rule of the Mendelian principles, and there are even some exceptions in these categories. The various other kinds of inheritance called blended or combined (where the two characteristics fuse or blend to form a new condition) and mosaic or particulate (where both parental characteristics exist side by side in each individual among the young) apparently require for their explanation something besides the Mendelian principles.

At some time between 1855 and 1865 Gregor Johann Mendel, an Augustinian monk in the small Austrian village of Brünn carried on in the gardens of his cloister pedigree cultures of peas and some other plants from which he derived data that he read, together with his interpretation of their significance, before meetings of the Natural History Society of Brünn, and which in the same year of their reading, 1865, were published under the title "Experiments in Plant-hybridization" in the *Abhandlungen* (vol. IV) of the society. Mendel was the son of a peasant, and had been educated in Augustinian foundations, and ordained priest. For two or three years he studied physics and natural science in Vienna, and refers to himself in one of his papers as a student of Kollar. He became Abbot of his cloister, and was for a time president of the Brünn Natural History Society. Such are the accessible details of the education and work of the man whose name will undoubtedly live forever in the annals of biological science.

Mendel's principal data were derived from the crossing of varieties of peas (*Pisum sativum*) in which he considered seven pairs of well marked contrasting characters, such as color and shape of pod and seed. Bateson has given a clear and concise account of Mendel's method from which I quote the following paragraphs:

"Large numbers of crosses were made between peas differing in respect of *one* of each of these pairs of characters. It was found that in each case the offspring of the cross exhibited the character of one of the parents in almost undiminished intensity, and intermediates which could not be at once referred to one or other of the parental forms were not found.

"In the case of each pair of characters there is thus one which in the first cross prevails to the exclusion of the other. This prevailing character Mendel calls the *dominant* character, the other the *recessive* character.*

"That the existence of such 'dominant' and 'recessive' characters is a frequent phenomenon in cross-breeding, is well known to all who have attended to these subjects.

"By letting the cross-breds fertilize themselves Mendel next raised another generation. In this generation were individuals which showed the dominant character, but also individuals which presented the recessive character. Such a fact also was known in a good many instances. But Mendel discovered that in this generation the numerical proportion of dominants to recessives is on an average of cases approximately constant, being in fact *as three to one.* With very considerable regularity these numbers were approached in the case of each of his pairs of characters. There are thus in the first generation raised from the cross-breds 75 per cent. dominants and 25 per cent. recessives.

"These plants were again self-fertilized, and the offspring of each plant separately sown. It next appeared that the offspring of the recessives *remained pure recessive,* and in subsequent generations never produced the dominant again.

"But when the seeds obtained by self-fertilizing the dominants were examined and sown it was found that the dominants were not all alike, but consisted of two classes, (1) those which gave rise to pure dominants, and (2) others which gave a mixed offspring, composed partly of recessives, partly of dominants. Here also it was found that the average numerical proportions were constant, those with pure dominant offspring being to those

*Note that by these novel terms the complications involved by the use of the expression "prepotent" are avoided.

with mixed offspring as one to two. Here it is seen that the 75 per cent. dominants are not really of similar constitution, but consist of twenty-five which are pure dominants and fifty which are really cross-breds, tho, like the cross-breds raised by crossing the two original varieties, they only exhibit the dominant character.

"To resume, then, it was found that by self-fertilizing the original cross-breds the same proportion was always approached, namely—

25 dominants, 50 cross-breds, 25 recessives,
or 1 D: 2DR: 1R.

"Like the pure recessives, the pure dominants are thenceforth pure, and only give rise to dominants in all succeeding generations studied.

"On the contrary the fifty cross-breds, as stated above, have mixt offspring. But these offspring, again, in their numerical proportions, follow the same law, namely, that there are three dominants to one recessive. The recessives are pure like those of the last generation, but the dominants can, by further self-fertilization, and examination or cultivation of the seeds produced, be again shown to be made up of pure dominants and cross-breds in the same proportion of one dominant to two cross-breds. The process of breaking up into the parent forms is thus continued in each successive generation, the same numerical law being followed so far as has yet been observed."

Perhaps the most striking thing about Mendel's work is the singularly suggestive and luminous interpretation which he gave of just why the pea characteristics were transmitted exactly as they were; why, in general, the peculiar numerical ratio between dominant and recessive should be, and why it should persist so uniformly. This interpretation or explanation is now well known in biology as the theory of the "purity of the germ cells" or as Cuenot has called it the theory of *"gametes disjoints,"* or *"la disjonction des characters dans les gametes des hybrides"* (the separation of characters in the germ cells of hybrids), the *Spaltungsgesetz* of de Vries. This interpretation is simply that in the young of the first generation after a cross mating altho, because of dominance, but one of the contrasting pair of parental characters will show itself in the body make-up, yet when these young form their germ cells the two parental characteristics will be represented, but only one of the characteristics in any one germ cell; that is, in the case of Mendel's peas the pollen cells and ovule cells produced by the cross-bred young would carry each only one of the alternative or mutually exclusive parental varietal characters. If this were the case and if on an average the pollen cells and ovule cells were evenly divided as to the two characteristics, then by miscellaneous or random mating (mating according to the law of probabilities) between these cells we should get in the developed young just such conditions with regard to the contrasting characteristics as Mendel actually did get in his peas. For 25 per cent. of the pollen grains, representing the dominant character would unite with 25 per cent. of the ovule cells representing the dominant character, 25 per cent. of the recessive pollen grains with 25 per cent. of the recessive ovule cells, and the remaining 50 per cent. of each kind with each other; that is of every four pollen grains and every four egg cells we should get by random pollination 1 pollen dominant $\times$1 ovule dominant, 1 pollen recessive $\times$1 ovule recessive, 1 pollen dominant $\times$1 ovule recessive, 1 pollen recessive $\times$1 ovule dominant. This condition would bring it about that the fully developed young would show the contrasting characteristics (remembering the results, in *appearance* of the individual, of the dominance of one of the characteristics in those cases where dominant and recessive are united) in this condition: 3D. 1R. Which is exactly what occurred in Mendel's peas, and has since been noted to occur in many other cases recorded by post-Mendelian observers and experimentors. These records are of both plants and animals, and are fast multiplying.

Thus the so-called Mendelian laws of heredity refer to two phases of the problem of inheritance, viz., (1) how inherited characters are actually distributed and (2) the fundamental cause, lying in the germ plasm, for this particular kind of distribution. Like Galton's formula, Mendel's law expresses the regularity of heredity based on actual recorded statistics of inheritance, but it also gives a satisfying fundamental reason for this regularity. Biologists, with few exceptions, see in the establishment of the Mendelian principles of heredity in biologic science the greatest advance toward a rational explanation of inheritance that has been made since the beginning of the scientific study of the problem.

Space forbids further discussion of our subject. It must suffice to say that the impetus given to the study of heredity by Mendel's work (which, extraordinarily enough, lay all unnoted by scientific men for thirty-five years until the simultaneous discovery of it in 1900 by three botanists, De Vries, Tschermak and Correns, each of whom was independently working along Mendelian lines and reaching the same results) is resulting in a swift and marvelous advance toward a scientific understanding of inheritance. In the last few years botanists and zoologists all over the world have begun elaborate experimental tests to see how generally Mendelism holds in the animal and plant kingdoms, and results are already being attained by these men that in large measure confirm confidence in those fundamental Mendelian principles of dominance, recessivity and of the purity of the germ cells. Among zoologists von Guaita, Cuenot, Davenport, Darbishire, Bateson and Castle working with mice, guinea pigs, rabbits and chickens; Miss McCracken with certain beetles, and Tōyama, Mrs. Bell and myself with silkworms; all have shown that the Mendelian principles apply to animals as well as plants. But in nearly all of these studies the investigators have found some inconsistencies and have caught glimpses of other principles, which, when finally grasped, will undoubtedly considerably limit the application of Mendelian laws, but will almost certainly not detract from their importance, nor lessen in any degree the high place in science that belongs to the patient, persistent, clear-minded Augustinian monk of the cloister gardens of Brünn.

# Confirmation

BY CHARLES W. STEVENSON

It cannot be!—
This intimate, self-knowing, sentient soul,
That looks in wonder on the gathered stars
And weighs the worth of swiftly passing thought;
That hath no conscious kinship to the brain
Of man, but sees the endless change of cell
And sea;—this soul, that suffers and is glad,
And feels the impulse most divine, a love
That sacrifices life in toil for love;
That recreates dull matter into forms
Of beauty, magical, and helpful use;
That looks upon another soul and finds
It good; and lifting faith to heaven beholds
The source and end of all that souls decree;
It cannot be—
That this imperious presence here shall fall
In rude decay, and be no more than dust
Blowing across the footprints of wise men,
Forgotten by the heart of Him who sits
Behind the veil, the Life of life, the One
Omnipotent, Omniscient, and All-good—
Who, else, were not the Father of his child,—
A child who asks in tenderness and tears
That hope be not a mockery, and trust
A fable of the years, and happy toil
A vague imagined dream, that death, at last,
Shall mingle with the cosmic vapor vast,—
It cannot be!—

# The Persecution and Oppression of Me

BY A HALF CHINESE

THE persecution and oppression of me is very real, tho perhaps not very apparent. The persecution is of such a peculiar character, and such is my demeanor under it, that the majority of those around me are led to believe that instead of being persecuted I am a persecutor. This was the exprest opinion of a good Western woman whose vision was somewhat shortened, and I have reason to believe that it is the opinion also of many Easterners. I am not sorry for this. I confess that I strive to give this impression. The dying game cock raises his head and crows while his foe stands over him. But to those who are not my foes there is more solace in writing the simple truth than in bravado.

I attribute this persecution and oppression of me to a peculiar combination of jealousy and prejudice. It is not the ordinary prejudice of race, I am convinced. All my life, wherever I have been, and wherever I go, I win friends and affection very easily. It is only after people have learned that there is a difference between me and them that the persecution begins. It is the persecution of the "Different." It seems that it is human nature to be cruel to the different. Even in families this is seen. Was not Joseph hated by his brethren because he was a dreamer? And in these days of the laudation of the commonplace, life is peculiarly hard for the "different." Yet none of us chose how we would be born. We are all part of a great plan, and it is pathetic to think that so many who were designed to be "different" are cowed into casting aside their individuality and sinking themselves into the great mass of the commonplace. I remember a clever little girl who used to pretend to be stupid because she wished her schoolfellows to love her. So strong the desire of the human heart for affection.

The temptation which assails the half Chinese who goes out into the world, as I have done, mixing for the most part with the respectable middle class of the community—the class which is the most antagonistic of all to the "different"—is to pass as wholly white. This is a very easy thing to do, particularly if you have the Caucasian features. Dark hair and dark complexion are not peculiar to the Chinese. There are dark people of other countries. Many French Canadian people are as dark and darker than the Chinese. There is a cast over the countenance of all persons who have Chinese blood in their veins; but this does not necessarily proclaim them Chinese. They can be of Spanish, Italian or Mexican descent. I know a half Chinese whose features are altogether Mongolian; but as long as she keeps exclusively with the Americans, and is not seen with the Chinese, no one of the Americans among whom she lives would think of her as Chinese.

Because of this temptation, few, if any, of the half Chinese women and men, living in America, save those who live with the Chinese side of the family and are dependent upon it, are known to the world as Chinese. This makes living easier for them; yet it is the exposure of such frauds that makes the name of half-breed a synonym for cowardice and all else that is contemptible.

The Persecution and Oppression of Me in America is because I will not be that sort of half breed, and prefer to reflect honor upon those who are of mixt Asiatic and European nationality. Why not? There is no real reason why any one who is Chinese as well as white should not be proud of the distinction. At the same time, I do not believe in being aggressively Chinese. It is only when, in the ordinary course of conversation, things are said and statements are made, untrue and unfounded, betraying bitter prejudice against the Chinese people, that, in spite of my natural desire to be liked and well treated, I feel that I must proclaim what I am. This, not for the sake of the Chinese, or for any one's sake but my own, and my own honor.

"What is your father? What is your mother?" "From what country do you come?" These are ordinary questions

and can be asked by mere acquaintances. Of course, one can give an evasive or untrue reply, but why should I? So, because I dare to be happy in my "shame," everything has been said and done which possibly could be said or done to humiliate me. I could not undertake to relate even one hundredth part of my experiences in this regard; but I will give a few, and tho some of them have been more amusing than painful, I am convinced they merit record as a protest against American race jealousy and prejudice.

A few years ago as I was traveling over the continent, I made the acquaintance of a man and woman from the State of Massachusetts. The woman seemed a pleasant person and her two year old little girl took a fancy to the seat beside me. That was all very well for awhile. There are times when I like children altho I have no constant craving for them. But when I saw that Mrs. G— began to leave me the entire charge of the child and to slip off the car at every station before I had an opportunity to return the little one to her, I made up my mind that if I was to derive any benefit myself from the trip, I would have to use my wits. I had heard enough of Mr. and Mrs. G's conversation to convince me that foreigners, *i. e.,* Japanese and Chinese, existed only outside the social fences of Massachusetts, which, by the way, Massachusetts people usually carry around with them. So when Mrs. G— returned from a nice little outing at a South Dakota station, I plumped little Kitty into her maternal arms and stated that I expected to meet some Chinese friends at the next stopping place. Had I told the woman that I intended to jump out of the window, she could not have looked more horror struck. "You know I'm Chinese myself," I added, and walked away. Several times during the course of the afternoon did poor little Kitty look my way, but from anything beyond looking, she was restrained. Once I heard the woman say to her husband, "And she came out so boldly with it. Not a bit ashamed!" She mightn't have meant me, but—. However, I enjoyed my stop at the next station.

Out West, prejudice is not nearly so bitter as it is in the East—not against the Chinese. It never was as petty as the Eastern prejudice. Nevertheless, I have had reason to take note of some peculiar manifestations of the untender passion.

I took rooms one time with a widow woman who lived in a little cottage in a suburb of the city, which from all that the widow said, when she persuaded me to pay for a month's rent in advance, would prove to be a peaceful Paradise. At that time I was studying Chinese and was in the habit of giving about half an hour to a Chinese manual every morning. Sometimes I carried the manual with me, sometimes I left it in the house.

On the third day, after moving into the cottage, my landlady knocked at the door and asked me to step out into the hall as she had something to say to me. "Come in," I called. "What is it?" "No, I will not come in," was the amazing reply, "I can't come in, because I'm afraid you will mesmerize me." I thought at first she was jesting, but when I turned to look at her I found her countenance rather too serious.

"I want to tell you," said she, "that you must stop it."

"Stop what?" I asked.

"Stop exercising occult powers over me; compelling me to like you against my will."

As the desire of my soul at that time was peace and tranquillity, I bade the woman close the door, at the same time unwisely remarking that it was a matter of indifference to me whether I was liked or not.

"You do care," she asserted furiously. "You have centred your mind upon me, and are using all your Oriental magnetism to draw me into your power." Then suddenly going down upon her knees, she cried: "I beg of you, I pray of you, to give up your study of occultism."

Naturally I began to think that I had a crazy woman to deal with and got up from my seat to lock my door. But she intervened her foot, and pointing to the table whereon lay my Chinese book, cried: "Can you deny it? See!"

Explanations don't explain in some cases.

I spent a restless night. I believed myself alone with a mad woman, yet I hesitated to call in any one or to say anything lest my suspicions should be unfounded. Also I feared that because

I was half foreign my tale would be pooh-poohed by the authorities.

The next morning I had occasion to pass my landlady in the hall. "It is all around you, all around you," was the greeting she gave me.

"What?" I queried.

"The atmosphere," she replied. "The atmosphere of your magnetism. I dare not come near you, for fear I should be drawn into its influence. It is the atmosphere of the East, of China or Japan —those cursed heathen countries." (The woman was of Spanish descent, but both she and her parents had been born in America. In religion she was Roman Catholic and while she talked, she clutched a cross in her hand.)

"Keep away from me altogether then," I returned impatiently. "When my month is up I shall leave you."

"What," she cried; "You little snip! You little Jap! You little Chinese! Dare to speak of leaving this house and I will spoil your little foreign face and put a knife through your heart."

I am a slender woman and not very tall, my heaviest weight not exceeding ninety-four pounds. My antagonist was a broad-faced, bullet-headed woman, heavily built, with a short neck, high shoulders and large sinewy arms. But even my worst enemies cannot accuse me of cowardice. So, for all the knife which she suddenly flashed out, I did not make any outcry. I simply returned to my room and began to pack. I could see at least that the poor thing really was sincere in her madness and dared not enter the charmed circle.

After packing and locking my trunk I again went into the hall, and was again accosted by my landlady, who seemed to have been doing some thinking. She informed me that landladies have certain rights and privileges as well as lodgers, and that as I was leaving her of my own accord, and not because she had put me out, I could not claim the month's rent in advance which I had paid, and no lawyer in the land would take my case. Furthermore she assured me that if ever I were to say or write a word against her, or reveal what had taken place, she would follow me to the ends of the earth and my life would pay the forfeit.

After playing my part in this thrilling drama I went to the house of a friend and stayed awake some nights in memory of it.

S. Y. J., a public school teacher, professed profound admiration for the Chinese, as a nation, and almost gushing affection for myself, as a friend. She was a bright and interesting woman and I liked her well for over a year. Yet, when we had a difference, in which I got the better of her, she revenged herself upon me by telling me that a relative of hers, who was also a teacher, was very much annoyed with her, because she would persist in being my friend, and cooingly added: "Isn't it mean of her? I tell her you are such a dear little thing. But she won't listen, only says: 'I'm sure she eats rats. All those Chinese do. And you needn't bring her to dinner because I don't know how to cook rats.'"

Altho the two women quoted are public school teachers, they are the daughters of laboring men, and I have seen them eat fish with a knife (not silver either). It is the educated sons and daughters of uneducated parents who are the most bitterly prejudiced against the Chinese. I have yet to meet a man or woman from a home of refinement and culture who, when worsted in an argument, resorts to the vulgar and cowardly weapon of race prejudice. I have noticed, however, that common people who wish to appear aristocratic and superior are usually the greatest race ranters and patriots: probably because that is the only way in which they can distinguish themselves.

When I last returned from the West I took up my residence in an Eastern town of some note. The house in which I lived was kept by a public school teacher, who was not teaching regularly. One day this teacher, who declared that she had taken a special liking to me, began a tirade against the negro race, and concluded it with: "But tho I despise and have the utmost contempt for the negroes, yet I hate worse the Chinese, who have such horrible ways." "You do, do you," I retorted; "Well, I am Chinese!" She gasped a little and said: "You're jesting, aren't you?" "No," I replied, "I am half Chinese." She told me she would never have guessed it, which she expected me to take as a great compliment. Then she begged me not to en-

lighten any one in the house as to the fact of my nationality, as she had said it would ruin her business should they know. I suggested that I leave her and take a room elsewhere; but she almost cried at the thought, and so as I do not like to grieve people I agreed to remain quiet; but at the same time reserved to myself the right to speak the truth should they ask me any questions.

As, when lodging around, I like to keep to myself, and dislike gossiping with neighbor roomers, it was no difficult matter to keep my nationality a secret from the other lodgers; but I soon discovered that my landlady, while begging me to keep quiet on the subject, made it her own business to inform certain persons, telling them as I subsequently learned, that she was allowing me to remain in the house out of pity, and because I really did seem like a white person, in some respects. I also began to observe that whenever she came into my room or I ran across her, if alone, she was very friendly and intimate. But when I met her in the company of others, she was a different person altogether, congealed, dignified and remote. I have very sharp ears and once I heard her say to a teacher from the South, "I'm polite to her, but would not think of treating her as an equal," and the teacher from the South returned, "The only way is to keep them down and order them about. That's how we manage the negroes, even the whitest blooded."

Unlike my landlady, the woman from the South was true to her principles. I can say that much for her, if nothing else. The following morning I met her in the hall, and tho I had never spoken a word to her or she to me, without any preliminary, she gave me this peremptory order: "Run upstairs and bring down the green cardboard box which I have left on the bureau in my room." Needless to say, the order was not obeyed.

Among the lodgers were several men teachers and professors. These, to whom my nationality had also been whispered, were in the habit of talking about me sotto voce. I heard that they could not understand how a person of inferior race could earn her living in America, thru the exercise of her mental faculties, while native born daughters, lectured, schooled and colleged, were sweeping out rooms and making beds for a living. The whole street in which I lived and many other streets around were full of lodging houses kept by such women, and bitter and warped indeed were the majority of the poor things. I call them poor things, tho there was not one of them but was better off in this world's goods than was I. But to return to the men. One of these told me that there were a couple of them who considered it an honor to be in the same house with me; but I have an idea that that speech was meant for my ears alone. You must understand that I was not supposed to know that any of the lodgers were acquainted with my nationality.

One day my landlady inquired if I did not think that the reason why I was brighter than the ordinary Chinese was because I had white blood in my veins. I answered that I hadn't the slightest doubt that the reason why I was superior to a great many *whites* was because I had *Chinese* blood in my veins. She repeated this at an indignation meeting which was held that evening, and one of the learned Ph. D.'s remarked that I was evidently of Tartar origin. Next day my landlady came up primed:

"Don't you think," said she, "that you owe it to the white people who are your friends to refrain from associating or having anything to do with the Chinese?" I said that I could not see things that way. I then informed her that a Chinese relative of mine was coming to visit me, and, of course, would stay in the same house in which I lived. She appeared very much perturbed and inquired if the said relative looked Chinese. I assured her that she was Chinese. "Well," said she, "it will ruin my business to have her here. I have not allowed it to be known that you are Chinese." "Then," I replied, "I will have to change my rooming house." She suggested that I find some other place for my relative. It was not necessary that we should live together. But no; where I was, there should be my Chinese relative. She almost cried. I was a permanent lodger, and permanent lodgers are very desirable. The teachers, after all, were only transients. "Oh," she declared, "I have liked you so well and hidden from all the fact that you are

a Chinese." The tone of her voice was that of one who says: "You are a thief and a criminal; but for personal reasons I have shielded you."

I could stand it no longer. I said: "I need no screen. I will not live where I have to be afraid to say what I am proud to be." Proud! She couldn't get over that, and, of course, the tale went around, and many curious eyes were leveled upon me as I passed thru the hall that evening, and in a voice loud enough for all to hear, said that I was going out to visit some Chinese relations.

It being an assured thing that I would move away, my landlady had no scruples about speaking her mind for the rest of the time I was there. One of the most would-be cutting things she said to me was: "Do you know what that negro woman who cleans the house every Thursday said to me? She said, 'I wouldn't be seen speaking to a Chinese.'" This was immediately after I had received a call from people socially and in every other sense above the criticism of landladies.

Furthermore, I cannot help feeling and believing that jealousy is at the root of much which I have had to endure.

I live alone, and as my means are limited, entertain not at all. When I go out it is to the library, the art museum, or to the parks or beaches. I am never lonely when I am alone; but have reason to know that my affection for the human family is as warm and perhaps truer than that of many of those who cannot find any pleasure in themselves or away from some social circle. But my work and my double nationality make me an object of both friendly and offensive interest to many. I am the recipient of many calls, invitations, letters and communications, sometimes by 'phone and sometimes by card, from persons seeking my acquaintance. Most of these would-be friends and acquaintances are absolute strangers, and it is seldom that I pay any attention to their communications; but occasionally some person who is really interested in my work inspires me to return the courtesy—when I am assured that it is a courtesy. It is only natural that one's heart should glow to know that one's work, tho insignificant in itself is being recognized for what it is worth or what it may lead to. On the other hand, it is oppressive and embarrassing to a woman of mature years to have to be the recipient of letters from men who pretend to entertain sentiments for her which are beyond the bounds of common sense or reason, seeing that the writers do not even know her. It is even worse to be called upon by such persons.

But some women can never forgive another woman for attracting any notice, either from the high or the low. Not even when the notice she received is only because of her nationality, which they claim to despise.

I cannot, however, blame any one for being jealous of and persecuting me for having inspired the following, chosen out of a bright variety of such effusions. The picture drawn is so true of me and so flattering to my vanity that I give it to the world with my high regards to the author:

*"Love, To Miss Confucius*

"How cold and irresponsive is this Chinese:
Of all the Shes
I've pled to—Maid Confucius—
Thou art most curious,
That Love quite fails to touch thy wisdom;
There does not come
A word responsive to its plea. Farewell, thou coldness!
As bloodless as thy China's oldness."

Doesn't that put the finishing touch to the persecution and oppression of me?

There is also directed against me a jealous persecution which is even harder to combat and much more subtle than the jealousy already complained of. This is the jealousy of those who call themselves the *friends* of the Chinese. I have experienced this only in the Eastern States.

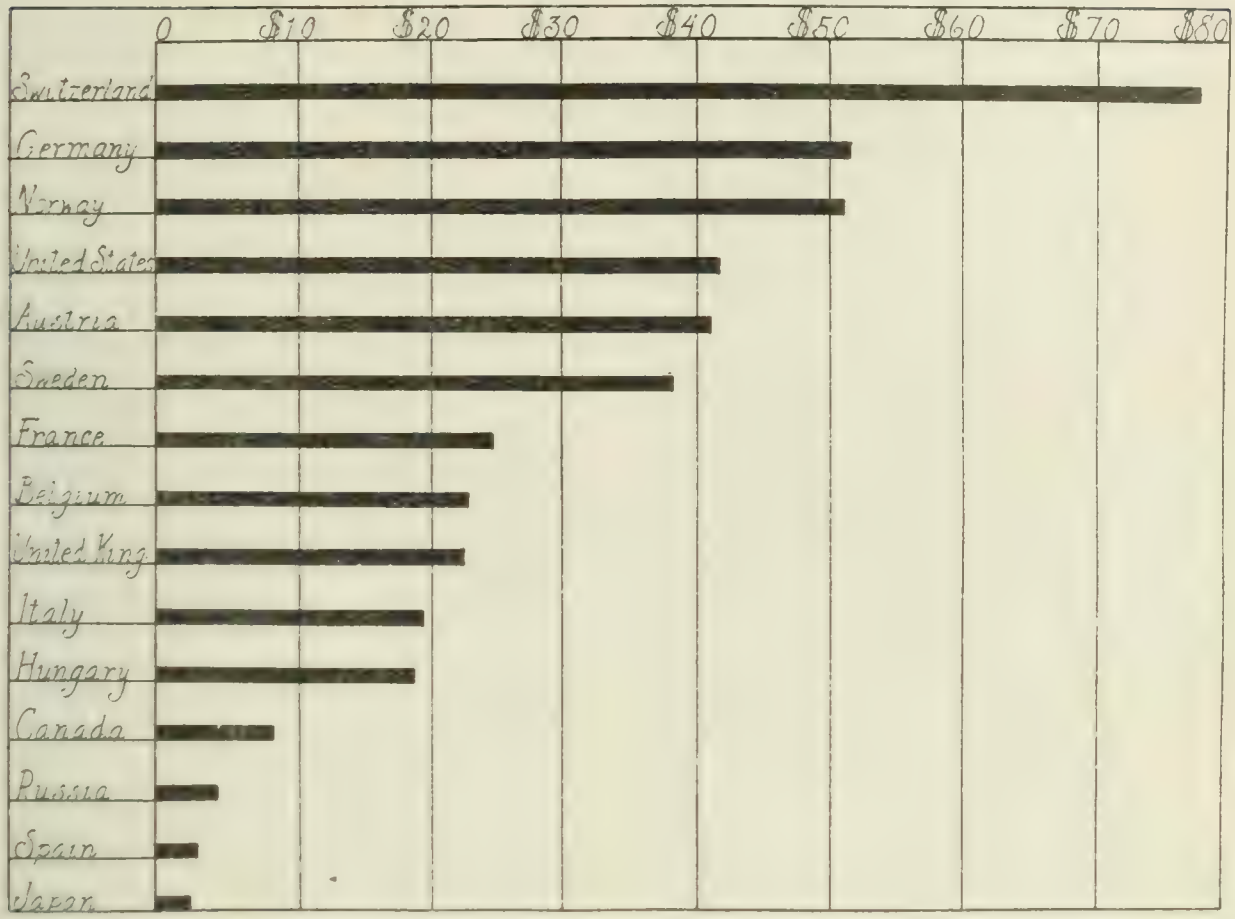
It is well known that tho there are many good and earnest women teaching religion to the Chinese in America, there are also many who are unfit for teachers in any sense of the word, and who adopt religion as their profession because it is the only profession open to all, and no examination as to qualification is required. These women are usually amiable and easy-going females, who, having no particular interest in life and advancing in years (tho some of them are young), take up with the simple Chinese, and no doubt make things, for a while, brighter and pleasanter for the exiles. In return for this they receive and sometimes exact a good part of the

Chinaman's earnings or business profits, if not in cash, at least in presents and money. The time they devote to the Chinese, and their constant attentions to them, also, in some cases, their staunch defense of the Chinaman against the persecution of the whites, entitle them to what they receive, and more, in a material sense. But all who have at heart the true welfare of the Chinese must take exception to these women, both as teachers of religion and as constant companions to the Chinese men. It needs no abnormal perceptiveness to realize that such teachers of religion make mockery of what is sacred; also that their association with the Chinese gives the Chinese a bad reputation, and causes the unthinking mass of whites to look upon them as beguilers of white women; whereas, the fact is, it is the Chinese who are the beguiled. Hence, the persecution of the Chinese by the Eastern Americans.

The intimate friendship of white women with Chinese men is the chief cause of the troubles of the Chinese in the Eastern States. In the Western cities, where the white women do not associate familiarly with the Chinese, there is no persecution to speak of and the Chinese name is not held in contempt, as in the East.

Thirdly — and this is the gravest reason of all to me why the state of affairs described above should not be —is because nearly all the Chinese in America are married men, and their wives and children in China, looking forward for their return, often have to wait much longer than they otherwise would because of this friendship between the Chinese and the white women, who, tho not by any means bad women, work much mischief in the families of the Chinese.

Now, these things I have pointed out to some of my Chinese friends, and the result has been that several of them are now devoting themselves strictly to business, while others are making preparations to return to their homes in China. It has been hard for me to do this. It makes life so much pleasanter for yourself if you will smile at wrong and call it right, as many good people advise us to do. Everybody will love you then, and you will have all kinds of good things showered upon you. But the love of everybody is no temptation to me, and I have never had any desire to accumulate riches. All my ambition is to make myself useful, known, heard and admired by the wise and the brave. "Naked we came into the world, naked we go out of it." So, when I see my friend about to drown, I do not stop to think whether holding him by the hair will hurt him or not.



Yet these women, failing to see things as I see them, are consumed with a foolish antagonism toward me, and, as I am told by some of the Chinese, are endeavoring with all their might and main to undermine what little influence I have. In more than one case of the more ignorant Chinese they have succeeded. This, of course, is to be expected under the circumstances, and what I complain of is not so much the success of their campaign as their methods and means. For instance, in their jealous prejudice, they will tell the Chinese that altho I am just as much Chinese as white, yet I live among the whites and associate with them on much more intimate terms than I do with the Chinese; that I am ashamed to be seen on the streets with the Chinese, save those of the higher class, and consider myself above them in every sense. Naturally the Chinese become worked up, and it is hard for me to explain to them that there are class distinctions as well as race, and that it would be quite beneath my dignity, and certainly be of little benefit to them, for me to tramp around with them to 10-cent shows and Chinese banquets, as do these women, who have nothing better to do. Also, that tho my left half is Chinese, yet I have been brought up entirely among Europeans, and for many years my circle of friends and relations embraced no Chinese save one parent. They will say (these are the exact words of one): "You have the Chinese hands, the Chinese voice, the Chinese hair. Back of your head you look just like a Chinese, and you have the Chinese little figure. You are more Chinese than white. You know more about the Chinese than the Chinese know themselves. But you live with the white people and you must like them best."

So I stand. It is all very amusing, of course; but at the same time, very distressing.

# International Savings

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY IN YALE UNIVERSITY.

POSSIBLY one of the best pictures of the well-being of the working-class of a country can be gained from the number and size of the savings bank deposits. In this diagram the length of shaded line represents the average deposit per inhabitant in specified countries in 1909, or the most recent year for which reports have been published. For most of the countries the amount includes the deposits in savings banks and postal savings banks. The splendid showing by Switzerland is to be attributed not to the large size of the average deposit so much as to the fact that the number of depositors is half as great as the total population of the country.

Germany leads in number of depositors with 18.6 millions, followed by Japan with 14.5 millions; but while the average depositor's account in Germany is $171, that of Japan is only $6.89. France and the United Kingdom have each 12.8 millions depositors; the average deposit in the United Kingdom is $80.70, and in France $74.83. In the United States there are 8.8 millions depositors, but the average deposit is over $400. The only country beside the United States to have over $300 in the average deposit account is Canada, with $306.32. Hungary with $232.52 is the only other country with more than $200 per account.

The total number of savings bank depositors in all the countries to issue reports upon this point is 104,806,535, with a sum of $13,483,386,593 to their credit. Some idea of the magnitude of this last figure can be gained from the fact that the estimate by the Director of the Mint of the world's production of gold and silver from 1492 to the present has had a value of about $26,000,000,000

## The Collusion Between the Supreme Court and Buchanan

It was a tense moment in the United States Senate when, on March 3, 1858, Mr. Seward, of New York, uttered his scathing denunciation of the august tribunal which guards the Constitution of the United States. Men of little importance and no political fortune here and there over the country had launched their diatribes against Chief Justice Taney and his colleagues who concurred with him; but now a responsible Senator from a great commonwealth, openly and without reserve, in language which admits of no misunderstanding, charges the President of the United States and the Supreme Court with deliberately entering into a conspiracy to fasten slavery forever upon the country. With almost brutal directness, Seward said, "Before coming into office Buchanan approached, or was approached by, the Supreme Court of the United States. . . . The day of inauguration came, the first one among all the celebrations of that great national pageant that was to be desecrated by a coalition between the executive and judicial departments, to undermine the national legislature and the liberties of the people." Then with flashing indignation he turned upon the court and pictured the judges as cringing sycophants like those tools of Charles I who did his bidding and then fawned upon him! The effect of this great speech was electric and news of it was quickly carried to every hamlet in the country.

Conservative and respectable men stood aghast at the rashness of the Senator from New York. Representatives of the slave-holding oligarchy declared the charges to be unfounded and wholly unbelievable—the vaporings of a disordered imagination, the outpourings of a mind destroyed by partisan and malignant hatred. Many of the best men in the country deplored this brutal assault upon the Supreme Court, declaring it to be not only without warrant, but also an attack upon our sacred institutions and a violation of the great principle of the separation of powers—an attempt of the legislature to browbeat the judiciary into obedience to the Republican party in Congress.

The ground for this dramatic outburst was the statement made the year before by President Buchanan in his inaugural address of March 4, 1857. In this address he said, speaking in regard to the point of time when the people of the territory may decide when they will accept or reject slavery:

> "This is happily a matter of but little practical importance. Besides, it is a judicial question which legitimately belongs to the Supreme Court of the United States, before whom it is now pending and will, it is understood, be speedily and finally settled. To their decision, in common with all good citizens, I shall cheerfully submit, whatever this may be. . . . May we not then hope that the long agitation on this subject [slavery] is approaching its end? . . . Let every union-loving man therefore exert his best influence to suppress this agitation."

At the time of Seward's speech it was supposed that he gratuitously assumed from Buchanan's inaugural address that the President had previously been in communication with the court and knew when he uttered this solemn pledge to abide by the constitutional decision, exactly what that decision would be. Seward, in his attack, declared that Buchanan "announced (vaguely indeed, but with self-satisfaction) the forthcoming extra-judicial exposition of the Constitution and pledged his submission to it as authoritative and final. The Chief Justice and his associates remained silent."

Men who believed in the integrity of the court would not accept Seward's declaration that there had been previous collusion between the two. They explained it on the ground that the rumors concerning the decision of the court had been spread in Washington, and that Buchanan in common with other politicians of the time had shrewdly anticipated the action of the judges. This is the view taken by that distinguished historian of the period, Rhodes (vol. II, p.

269), who argues that Buchanan must have known from the rumors and statements in newspapers what would be substantially the decision of the court on the territorial question. In common with the temperate men of that time, Rhodes holds that there could have been no direct communication between the President and the court on the subject, for he says, "However Buchanan got his intelligence, his character and that of Taney are proof that the Chief Justice did not communicate the import of the decision to the President-elect. That either would stoop from the etiquet of his high office is an idea that may not be entertained for a moment; and we may be sure that with Taney's lofty notions of what belonged to an independent judiciary he would have no intercourse with the executive that could not brook the light of day."

That Seward's wild charge that the President had approached the Court, or the Court had approached the President, is true, and that the replies of men of sober judgment were false, we now know from letters published in the *Works of James Buchanan*,* edited by Prof. John Bassett Moore. This great work contains the result of an exhaustive research into the Buchanan materials. Nothing has been withheld. All Buchanan's correspondence as Secretary of State, including all his papers relating to the Mexican War, is fully set forth, in addition to the documents relative to his Administration. And with that devotion to the principle that science demands the truth and the whole truth, Professor Moore has published without elision, and with proper editorial reserve, the materials which will be vital in the reconstruction of that period of our history and which will help to give Buchanan a higher place in many respects than has been hitherto accorded to him by partisan Northern histories.

Among these papers, as footnotes to the first inaugural address (volume X, pp. 166-7 ff.), Professor Moore prints two letters addressed to Buchanan, one from Justice Catron, of Tennessee, and the other from Justice Grier, of Pennsylvania, which show that the Court *had* approached Buchanan some time before his inauguration; that Buchanan had brought some kind of pressure to bear upon the Court; that the Chief Justice and Justice Wayne (the latter of whom had been chiefly instrumental in forcing the judgment upon the Court) were fully aware of and approved the negotiations between the Court and Buchanan; and that when Buchanan made his statement in his inaugural address that he would abide by the decision of the Court he knew definitely what the important point in that decision would be.

In the first of these letters, under the date of February 19, 1857, Justice Catron writes to Buchanan suggesting what he might safely say in his inaugural address about the Dred Scott case and asking him to write to Grier and endeavor to bring him to terms:

> "Will you drop Grier a line, saying how necessary it is—& how good the opportunity is, to settle the agitation by an affirmative decision of the Supreme Court, the one way or the other. He ought not to occupy so doubtful a ground as the outside issue—that admitting the constitutionality of the Mo. Comp. line of 1820, still, as no domicile was acquired by the negro at Ft. Snelling, & he returned to Missouri, he was not free. He has no doubt about the question on the main contest, but has been persuaded to take the smooth handle for the sake of peace.
>
> "Sincerely yr. frd.,
>
> "J. CATRON."

Whether this letter from Catron was drawn by a previous letter from Buchanan it does not appear; but we do know that Buchanan wrote to Grier, for in a letter of February 23, 1857, from Grier to Buchanan, the former says:

> "Your letter came to hand this morning. I have taken the liberty to shew it in confidence to our mutual friends Judge Wayne and the Chief Justice. We fully appreciate and concur in your views as to the desirableness at this time of having an expression of the opinion of the Court on this troublesome question. *With their concurrence* [italics mine] I will give you in confidence the history of the case before us, with the probable result."

This is followed by a story of the case and a statement as to how the final result was reached. Grier also says, "I am anxious that it should not appear that the line of latitude should mark the line of division in the Court"—in other words, he did not want to help discredit the Court by showing that it was a pure slave decision rendered by judges from slave States. So Grier, of Pennsylvania, in his own language, "in conversation

with the Chief Justice, agreed *to concur with him*." Grier in this letter also adds, "There will therefore be six if not seven (perhaps Nelson will remain neutral) who will decide the compromise law of 1820 to be of *non-effect*. But the opinions will not be delivered before Friday, the sixth of March." Then Grier concludes:

"We will not let any others of our brethren know anything about *the cause of our anxiety* to produce this result, and though contrary to our usual practice, we have thought due to you to state to you in candor & confidence the real state of the matter."

As Professor Moore justly remarks, these letters "are obviously inconsistent with and tacitly refute the charge that the Dred Scott case was the result of a conspiracy in which the 'Kansas-Nebraska Bill was the first step.'" But they do prove that President Buchanan, Chief Justice Taney and other justices of the Supreme Court were not above entering into correspondence for the purpose of reaching some adjustment of the slavery issue that would be wholly acceptable to the slave power. They proved that the charges made by Seward and afterward repeated by Lincoln in milder form were true, altho these men apparently had no direct evidence warranting their statements. In view of these facts we do not wonder that, as Rhodes says, "Taney was so incensed at the speech of Seward that he told Tyler, who was afterward his biographer, that had Seward been nominated and elected President in 1860 instead of Lincoln he would have refused to administer to him the oath of office." That the far-seeing politician from New York had penetrated so deeply into the relations of the executive and the judiciary was enough to have incensed all of them.

**The History of the Great American Fortunes.** By Gustavus Myers. Volumes II and III. Chicago: Charles H. Kerr & Co. $1.50 each.

The second volume of Mr. Myers's history deals with some of the fortunes gained from railroads, particularly the fortunes of Vanderbilt and Gould. Cornelius Vanderbilt is treated as the "foremost mercantile pirate and commercial blackmailer of his day." His career is traced from its beginnings to its close, and the means whereby he gained his supremacy are related in detail. The curious contrast between the public's view of Vanderbilt and its view of Gould is treated at some length. Gould was generally regarded as a buccaneer, Vanderbilt as a man of probity, even if somewhat stern and ruthless. Mr. Myers shows from authentic records that the methods of the two men were not dissimilar and that if the term buccaneer could be applied to Gould it could with equal measure be applied to Vanderbilt. The latter had the shrewdness or the good taste, which Gould did not have, to direct some of his benefactions to popular institutions; and thus the public was led to overlook or condone the acts of one which it condemned in the other. Two chapters are given to a consideration of the seizure of the public domain, and an incidental treatment of the frauds practised upon the Government during the Civil War is given. The history of land frauds is a mournful record of gigantic theft upon theft from the time of the foundation of the Government to the present—a record almost incredible but for the mass of documentary evidence which Mr. Myers cites. The Civil War frauds, which were the basis of so many respectable fortunes of today, have never been adequately treated. Mr. Myers shows that the men who supplied the Government with rotten ships, shoddy clothing, decrepit horses, worthless ammunition and condemned firearms were as much an enemy to be feared as were the Southern armies. In the third volume of his series Mr. Myers deals with the fortunes of Russell Sage, the Gould family, J. Pierpont Morgan, the Pacific Quartet—Collis P. Huntington, Leland Stanford, Charles Crocker and Mark Hopkins—James J. Hill and a few others less notable. Even allowing for over-emphasis, for occasional inaccuracy and for evident bias the book must make a patriotic reader sick at heart over the failure of the people of the United States to prevent or to punish the Brobdignagian sacking of railways, looting of Federal, State and city treasuries, swindling of investors and creditors, corruption of legislatures and defiance of laws which the author demonstrates. In literary effectiveness the book would have been improved had its tone not been

so bitter and vituperative and had the numerous digressions from the main topic of each chapter been avoided and the history of each fortune been more succinctly and consecutively narrated.

**Old English Instruments of Music.** By Francis W. Galpin. Chicago: A. C. McClurg & Co. $2.50.

**Dictionary of Musicians.** By W. J. Balzell. New York: Oliver Ditson Co. $1.25.

"The cornet, flute, harp, sackbut, psaltery, dulcimer, and all kinds of musick," are familiar words to Bible readers, but how many Bible students even in this day and generation have any idea of what the sackbut, or the psaltery, or the dulcimer, was like? or of what sort of music was made with those quaint old instruments of King James's time?—for the translators rendered the names of ancient things which they did not know into English names of things with which they were familiar. In Shakespeare also and the other Elizabethans more or less read and studied today there are many names of obsolete musical instruments. Not only descriptions and historic accounts, but also pictures of all these old instruments are given in the Rev. Mr. Galpin's book, which is a rich mine of information about the various types of musical instruments that preceded those now in use. The author is a zealous student and collector of old English instruments, and he writes about them authoritatively and well. In illustration many valuable reproductions, here made for the first time, from medieval paintings, illuminated manuscripts, sculptures and carvings, light up clearly many points which have been heretofore vague or uncertain. The author notes with sorrow that England has no such national collection of musical instruments as the great Crosby Brown collection in the Metropolitan Museum of Art in New York, which he places at the head of all such collections in public museums.——Those who want a dictionary of condensed biographies of musicians, past and present, will find a fairly satisfactory one in Mr Baltzell's work. It contains concise sketches of not a few contemporaries too new to fame to have been mentioned in older compilations.

**Mysticism.** A Study of the Nature and Development of Man's Spiritual Consciousness. By Evelyn Underhill. New York: E. P. Dutton & Co. $5.

Of the many recent books which mark the revival of interest in theoretical and practical mysticism, this is the most thoro and comprehensive. The exposition of the characteristics and methods of the mystics of ancient and modern times is supported by abundant quotations from original sources and a long bibliography. There is a certain advantage in treating the subject topically instead of biographically or historically. It shows more clearly the persistence and similarity of the mystic type in all lands and ages in spite of the fact that their theology and imagery are molded by the conventions of the times. The author's own theories and preferences, tho earnestly presented, are never carried so far as to suppress discordant exceptions or to ignore opposing views. The style is fluent and the immense weight of learning is carried easily and without pedantry.

**Behind the Screens in Japan.** By Evelyn Adam. New York: G. P. Putnam's Sons. $1.50.

It is, perhaps, significant that the Englishwoman whose impressions of the new Japan we have here, originally intended to name her book "Behind the Shoji——" for the author interlards her English prose with as many Japanese words and phrases as eighteenth century travelers thought it incumbent upon them to use of French phrases when they wrote letters home or compiled their stodgy memoirs. The writer of this book about the Flower Kingdom has known her subject long enough to lose that first surface glow of traveler's enthusiasm for a land so wonderful; she says hard things about certain modern tendencies and traits developed thru the sensationally rapid adaptation of that people to Western conditions and habits. Here she adopts Hearn's point of view. But her book is undistinguished by the genius for color and beauty of line and depth of suggestion that the author of "Kwaidan" and "Kokoro" had. She does not, however, attempt "literature." She rightly thinks that

there is room for mere "impressions"—and she is a six years' resident who is essentially British in spite of that residence.

**Richard Henry Dana, Jr.: Speeches in Stirring Times and Letters to a Son.** Edited with Introductory Sketch and Notes, by Richard H. Dana (3d). Boston: Houghton Mifflin Company, 1910. $3.

The author of "Two Years Before the Mast" died in 1882. For the lucid story of a boy's life as a sailor nothing has ever been written that better deserves immortality than that first book. It has in it not only the tale, admirably told, of a young sailor getting his early experience with the ropes of an old-fashioned sailing vessel, but the story of a pioneer in unknown seas, of a trader whose adventures are on strange coasts. Written at a time when pioneers, discoverers, frontiersmen, were near the end of their romantic days, it appealed strongly to its generation. The number of editions published marks but poorly the multitude of readers who have found joy in its pages. For it was a healthy book—full of sentiment, yet not sentimental; written in terse Saxon English, and yet filled to the full of the real life of the sailor. The material of it was gathered by a boy; its sentiment by a man of action; its aim steadied by a budding statesman. The later work of the statesman deserves also a prolonged life. One need not dwell long on some of the matter supplied by the son in this revival of his father's literary product. The *Letters to a Son* make but a trifling addition to the vast bulk of educational literature to be digested by fathers. Some of the legal arguments quoted out of the abundant pleadings of a lawyer, while showing clear reasoning and courageous action in face of a deadening public coldness and inaction, are yet easily matched by many a plea left to the silence of the ages. There are left, however, and worthy to be remembered long, half a dozen speeches and pleadings, like those dealing with the old "Usury Laws of Massachusetts," with the definition of "Enemy's Territory" and "Alien Enemies," in connection with the treatment of prizes taken by our ships blockading the Southern coast during the Civil War, and the notable "Grasp of War" speech, delivered in 1865. These are all clear deliveries on long-contested points of economics and on international questions by no means fully settled yet. They will serve to clear up some misunderstandings as to the Monroe Doctrine and as to fishing rights over the free swimmers of the ocean.

**The King's Customs.** Vol II. 1801-1855. By Henry Atton and Henry Hurst Holland. New York: E. P. Dutton & Co. Pp. xi, 506. $3.50.

Customs tariffs have created more criminals than any other code of laws ever enacted by man. Smuggling, undervaluation of imported goods, and collusion of customs officials are all as old as the attempt to raise revenue by means of taxes collected on imports, and they are as modern as the latest records of our courts. There are many picturesque incidents in the second volume of Messrs. Atton and Holland's *The King's Customs*—enough to furnish outlines for innumerable boys' stories of desperate adventures. There is also much about the venality of the officials set to guard and collect the King's customs, and, without making any reflections on the stories they relate, there are also graphic pictures of the costliness of customs house methods of collecting revenue. In 1844, when England was on the eve of free trade, there were twenty-eight ports in England, Scotland and Ireland where the cost of collecting the customs equaled or exceeded the revenue collected, and in many of the British colonies at this time the cost of the customs service exceeded many times over the receipts. As in their former volume, which was published in 1908, Messrs. Atton and Holland make no effort to arrive at any economic principles, nor do they attempt to give a connected history of customs taxation. Their work is largely in the form of annals. They have gathered from the immense volume of records within their reach at the customs house the outstanding changes in customs laws, administration, and the principal events, such as criminal trials or reports of smuggling seizures. These

they have woven into a somewhat continuous narrative, rarely allowing any personal expression of opinion to escape them or making any comment on the trend of opinion and legislation as regards customs duties.

**Narratives of Early Carolina. 1650—1708.** Edited by Alexander S. Salley, Jr., Secretary of the Historical Commission of South Carolina. With two Maps and a Facsimile. New York: Charles Scribner's Sons. $3.

The *Narratives of Early Carolina* is the eleventh in the series of "Original Narratives of Early American History." The volume covers the first fifty-eight years of the story of the coast settlements, the trips inland, and the tribulations of the men who penetrated the forests and the lower hill country. From Edward Bland's statement, made to that regicide judge, Sir John Danvers, of the discovery of New Brittaine in 1650, down to the alluring arraignment by Daniel Defoe, in 1705, of the harsh reign of the Established Church over the Dissenting body of early settlers, and the subsequent historical account, in 1708, given from the same point of view, in John Oldmixon's history, we have a fair presentation of the pioneer difficulties of "founding a state and bringing the gods" to the Carolinas. They were a God-fearing people—those early pioneers. Says Bland to his reader: "Whoever thou art that desirest the advancement of God's glory by conversion of the Indians, the Augmentation of the English Commonwealth, in extending its liberties; I would advise thee to consider the present benefit and future profits that will arise in the well settling Virginia's Confines, especially that happy country of New Brittaine, in the Latitude of 35. and 37. degrees." "God's glory" and "future profits" were thus kept clearly in sight. Bland took the initiative in 1650; but, four years later, Francis Yeardley followed with "an ample discovery," finding a "most fertile, gallant and rich soil." Robert Horne, in 1666, bestowed his blessing on all who would go there to settle. By this time, Charles the Second, "whom God preserve," had become Lord Paramount, and certain "Honorable Persons" offered inducements to "such as are here tormented with much care how to get worth to gain a livelihood, or that with their labor can hardly get a comfortable subsistance." All such are assured that they "shall do well to go to this place, where any man whatever, that is willing to take moderate pains, may be assured of a most comfortable subsistance, and be in a way to raise his fortunes far beyond what he could ever hope for in England." Moreover, "if any Maid or single Woman have a desire to go over, they will think themselves in the Golden Age, when Men paid a Dowry for their Wives; for if they be but Civil, and under fifty years of Age, some honest Man or other will purchase them for their Wives." There is spice in these early stories. We see the eager eye of the trader; we almost hear the trap snap on the left foot of the furtive beaver. We learn the virtues of tobacco and timber, as we go along with an eye on the unconverted savage, whose spiritual state we deplore, even while we are exploring his temporal estate for the pot of gold presumed to be concealed there.

**Medieval Sicily.** Aspects of Life and Art in the Middle Ages. By Cecilia Waern. New York: E. P. Dutton & Co. $4.

The unsophicated tourist in Italy when he crosses to Palermo is surprised to find about him architectural remains for which his reading has not ordinarily been sufficient to account. Byzantine mosaics he has become accustomed to further north, but how did Saracenic mosques and Norman churches get here? This large and handsome volume of mingled history and archeology is admirably adapted to relieve such ignorance, whether complete or partial. The condition of society under the two centuries of Arab rule and after the Norman conquest of 1061 is described in detail and enlivened with quotations from contemporary Arabic narratives, not accessible in English. It is interesting to read of the time when in what is now the most Catholic of countries, Christians were not allowed to appear upon the streets unless their clothes bore the badge of a pig, while Jews were indicated by an ape.

## Literary Notes

....A funny story that is really well written is rare nowadays. One is to be found in the September Century. *Perhaps It Didn't Matter,* by Chester Bailey Fernald. It reads well aloud.

....Aspinwall's *Pocket Guide to the West Indies* (Dutton; $1.50) is intended for the English tourist and is chiefly devoted to the British possessions, Jamaica, Barbados, British Guiana, Trinidad, Dominica, etc., giving maps, historical data and hints to the traveler.

....Norman Douglas's *Siren Land* is an exceedingly well written and altogether authorative book about Capri (Dutton; $2). It is a learned work, but not too heavy to offer excellent entertainment. The illustrations are numerous and show great variety.

....The average American has been talking a good deal about Mexico recently, but knows very little about it. Consequently the handbook of *Mexico* prepared by the Pan-American Union ($1) is much needed. It is packed full of facts and figures, chiefly commercial, with numerous diagrams and maps.

....Almost attractive enough to persuade us that its attractiveness will be appreciated by the schoolboy himself is A. W. Leonard's edition of *Irving's Sketch Book,* published by Holt. Five of the essays are omitted from this reprint. There are a brief biography, criticism, and bibliography, an appendix, and a few notes. Yet the appearance is not that of a textbook.

....Dr. F. Stuart Chapin in his essay on *Education and the Mores* (Columbia University; 75 cents) comes to the conclusion that education remains as formerly, the conserver of tradition and that the majority of the pupils never get to the point where notions and facts of genuine scientific value and real human interest come in.

....Somewhat disappointing is Dr. Frederick Augustus Braun's *Margaret Fuller and Goethe,* with its jaw-breaking sub-title: "The Development of a Remarkable Personality, Her Religion and Philosophy, and Her Relation to Emerson, J. F. Clarke, and Transcendentalism" (Holt; $1.50). One feels the essay to be wanting in balance and proportion.

....Una Birch has brought together four contributions to British reviews under the title *Secret Societies and the French Revolution, together with Some Kindred Studies* (Lane; $1.50). Besides the secret societies, the Comte de Saint-Germain, Religious Liberty and the Revolution, and Madame de Staël and Napoleon come in for examination

....From George Bell & Sons we receive a copy of *Some Supposed Shakespeare Forgeries* by Ernest Law, in foolscap quarto (3s. 6d.), with facsimiles of documents. This is the story of the Books of Revels at Court, which has a bearing on the problem of Shakesperean chronology, and brings before scholars, in convenient form, material of high interest.

....The reminiscences of H. M. Queen Elizabeth of Rumania are entitled, in the English translation, *From Memory's Shrine* (Lippincott; $2.50). In her own phrase, she "throws open the sanctuary." This is, however, something of an overstatement, for the autobiography is reserved. Yet those who love Carmen Sylva's gentle personality will find the book a pleasing and sentimental narrative.

....A recent Columbia doctor of philosophy has been more successful than most graduate students in finding a new field for his thesis. Hawkling L. Yen, in his *Survey of Constitutional Development in China* (Columbia Univ.; $1) gives first the political theories of Confucius and other classical teachers and then tells of the new popular movement which suddenly developed after twenty centuries of inert absolutism.

....The body of William Blake was buried in a "common grave" in Bunhill Fields, for the poet and painter died penniless and unappreciated. Tho the cemetery is not an undistinguished spot (near Blake's final resting place lie the remains of Daniel Defoe, John Bunyan and Isaac Watts), some of the great mystic's admirers of this materialistic age are planning the erection of "an appropriate memorial."

....To read Protheroe's *Handy Natural History,* published by Richard G. Badger of Boston ($4), one would think it was written in the early part of the last century. It is in the pietistic style of the Bridgewater Treatises and untainted by the faintest suggestion of Darwinism. But it is abundantly illustrated by color plates and photographs, including one of a stuffed okapi, so the book has a specious appearance of modernity.

....The man who has led the choral revival which has stirred England to a new interest in good music in recent years and who in this summer of 1911 is taking his Sheffield Choir of 200 singers on a "round the world tour" (chiefly of the British dominions, but in the course of which concerts are scheduled for several American cities) is the subject of an enthusiastically appreciative little biography in *Dr. Henry Coward: The Pioneer Chorus-Master,* by J. A. Rodgers (John Lane Co.; $1).

....The collaborative *Short History of the United States Navy* newly issued by J. B. Lippcott & Co. ($3) "owed its origin to the need of a work suitable in scope and treatment as a text-book for the midshipmen of the United States Naval Academy." It is a volume of almost 500 pages, well indexed, well illustrated, and thoroughly attractive. The work seems authoritative, and is signed by Captain George R. Clark, Professor W. O. Stevens, Dr. C. S. Alden and H. F. Krafft, of the Naval Academy.

....The master cooks of Paris are demanding copyright for their inventions. They wish to form a national institute with the same prerogatives as the existing academies. The mission of the "Sixth Academy" will be to watch over the national cuisine as the Académie Française watches over the language. The cooks complain that when a master mind creates a new dish after years of study and experiment a host of imitators spring up and the recipes are printed, generally inaccurately, without permission or payment to the author.

....There will soon be no part of the inhabited earth, and perhaps no uninhabited part either, without its travel-literature. The volume which J. E. Crawford Flitch calls *Mediterranean Moods* and, in a subtitle, *Footnotes of Travel in the Islands of Mallorca, Menorca, Ibiza and Sardinia* (Dutton; $4) affords this difference from most travel books, however: it is the production of a discriminating traveler, and one who realizes that "Travel involves a double journey—one forward thru space, the other backward thru time." His book is illustrated from photographs.

....The world needs inspiration and failure in self-development doubtless accounts for a great deal of the inefficiency noticeable on every hand. Out of the veritable flood of books written to set the world right in these respects one selects those of Mr. Orison Swett Marden, the forceful editor of *Success*, as having special value and power. If one desires to know the part played by mental altitude in the success or failure of his cherished projects he may turn to Mr. Marden's clear and sensible presentation of the subject in *The Miracle of Right Thought*. To learn ways of wisdom in business and social pursuits the young man could scarcely do better than absorb the high principles and purposes so carefully expounded in *Getting On*. And no one can keep himself up to a high degree of efficiency in his work or secure the pleasurable fruits of his labor, to which he is justly entitled, unless he puts into practice much of the wholesome advice included in Mr. Marden's *Be Good to Yourself*. Each of these volumes is to be commended for its plainness of speech and insight into real difficulties and possibilities (Crowell; $1 each).

....The Parisian impresario, Schurmann, has just published his memoirs under the title, *Secrets de Coulisses*. He tells a good story of Suzanne Després, who presented "A Doll's House" and Jules Renard's one-act "Poil de Carotte" (the English version, "Carrots," was given here by Miss Barrymore) in a provincial town. The enthusiasm was tremendous. A society woman was particularly emphatic in her expressions of pleasure. But before she left the actress's dressing room she spoiled it all by addressing the heroine: "May I ask you a question? Why were you dressed as a little boy with a red wig in the fourth act of 'Norah'?" She had taken "Poil de Carotte" to be the sequel of the Ibsen drama. Madame Després was so disgusted that she could never be induced to revisit the locality.

....Of Maeterlinck, M. Schurmann draws a picture quite the reverse of that popularly imagined: he describes him as a benevolent giant, with a Belgian accent, who asks what there is for lunch as he gets out of the train and whether there is any good beer in the place. The impresario says he has never known an author more indifferent to the stage performance of his plays. When Maeterlinck visited the Gymnase a week after "Joyzelle" had been staged, he left before the end, remarking to the manager: "After 10 o'clock the best place is bed."

....*The Suffragette*, by E. Sylvia Pankhurst, is a straightforward account of the Militant Movement in England, from the formation of the Women's Social and Political Union, by Mrs. Pankhurst, October 10, 1903, to the present. This inside history, with its passionate partisanship of the woman's cause, does much to explain, if it does not quite extenuate, the extreme tactics adopted by Mrs. Pankhurst and her followers, in order to get a hearing for their measure. However distasteful those methods may be, the Suffragettes cannot be denied courage, resourcefulness and heroism in their mistaken martyrdom. (Sturgis & Walton; $1.50.)

....Students of the English Bible will find a valuable collection of documents relating to the translation and publication of the version of 1611 in *Records of the English Bible* Frowde; 5s.), edited with notes and a scholarly introduction by Mr. A. W. Pollard, of the British Museum. The original texts of letters, proclamations, prefaces, etc., are reproduced and those in Latin and French are either translated or summarized. Altho some of the documents have little bearing on the main history of the English Bible, they throw much light on the political and religious back-

around whence the work of translation springs and give many a hint as to the character and purpose of those engaged in the work.

Three of the plays presented during the last season at the Abbey Theater lie before us in the sixpence (and shilling) editions of Maunsel & Co., Dublin. Johanna Redmond's *Falsely True* is "an incident after the Rising in 1803." The scene is a cottage near the town of Wicklow. The characters are an Irish peasant, his wife, and his son Shaun. The latter has been freed from prison (where he was placed after a riot in the town) in return for testifying against others—including his own brother. The revulsion felt by the parents upon the return of their weak and now remorse-stricken son is well depicted. The piece ends with his going out "into the night" (a recurrent phrase in these Irish dramas) The play is in one act.

....*Birthright,* by T. C. Murray, is a two act drama. Here again there are two sons. The one typifies the solid qualities—tho he wants all manner of generosity in spirit; the other the more imaginative traits of Irish character. Their father is a hard man, and is doubly hard on his more gifted son, whom he disinherits. A quarrel between the brothers ends in murder—and the murderer, like the informer of the earlier play, goes out "into the night."

....The third play, *Mixed Marriage,* by St. John G. Ervine, is scarcely more cheerful. Here there are four acts and a more complicated action. The characters are well depicted, especially that of the stern but futile parent, a kind of Orangeman John Shand, whose weaknesses are comprehended and pitied by his wife, roughly corresponding to the little lady of Barrie's play who lacked "charrrm." But the comedy is only incidental. The scene seems to be Belfast. An idealistic Irish Catholic, Michael O'Hara, sees his hopes of uniting the suspicious and warring religious factions utterly defeated. Nora, who was loved by the John Shand's son Hugh, is shot by a bullet fired in the course of a riot that her lover's father might have averted. But if the conclusion is depressing, the work of this playwright is notable in its flashes of understanding and of humor. He is even less violent, on the whole, than most of the writers now providing dramas for the Irish stage. Tho he has not proved himself the equal of the late John Synge, whose work THE INDEPENDENT has called to the attention of American readers as vivid, and rarely vital, we await his next play with genuine interest. It is only a few weeks now before American audiences may judge for themselves the quality of the contemporary Irish theater, and the acting of the Abbey players, whose tour will open in Boston early in September.

## Pebbles

TEACHER—Bobby, give an example of the double negative.

Bobby—I don't know none.—*Boston Transcript.*

"WON'T you come into the parlor,
Where the light is burning low?"
"No, I thank you, Mary, darling;
I don't like mush-rooms, you know."
—*Columbia Jester.*

THE Rev. Charles H. Spurgeon was fond of a joke and his keen wit was, moreover, based on sterling common sense. One day he remarked to one of his sons:

"Can you tell me the reason why the lions didn't eat Daniel?"

"No, sir. Why was it?"

"Because the most of him was backbone and the rest was grit."—*Youth's Companion.*

PLAYWRITING IN FRANCE.

The French playwright had begun the third act of his latest problem drama. It was to be a great act, an act that required expression, repression, even suppression.

The heroine had just fallen across the threshold she had disgraced, and was about to utter her first impassioned speech, when the playwright's valet appeared in the doorway.

"M'sieur no doubt remembers that he has to fight M. René Slosh at three o'clock?"

The dramatist threw down his pen.

"No; I had forgotten."

Casting a look of poignant regret at his manuscript, he sought the field of honor and almost immediately jabbed his rapier thru the wristband of his opponent.

Then he returned home. Again he took up the pen. The valet reappeared.

"M'sieur fights the Duc de Mushead at 3.40."

Sighing heavily, the goaded playwright stalked back to the same field of honor and promptly shot the little duke thru his title.

Once more he took up the pen—only to throw it down. At 4.20 he had to fight the Marquis de Weeshbon; at 4.45 he met the feuilletonist, M. Guille Gazook; at 5 o'clock he shot up the Count de Bute; at 5.30 he perforated the pompadour of the Prince of Poompernique.

Then he spent the entire evening at the clubs and cafés, giving and receiving insults.

At midnight he was free again. Once more he raised his pen—and dipped it recklessly in the mucilage pot, being too sleepy to note the difference.

"Playwrighting in France," he drowsily murmured, as he slipped from the chair to the hearth rug, "is no idle pleasantry, believe me!"—*Cleveland Plain Dealer.*

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## The President's Vetoes

PRESIDENT TAFT deserves only the warmest commendation for his veto of the bill for the admission of Arizona and New Mexico as States of the Union. It seems a great pity that the two States should have been united in the same bill, so that when Arizona is excluded by the veto New Mexico has to suffer also. The average citizen cannot see the reason of lumping together two States which rest under different conditions, particularly when it was well known that the President was likely to veto the bill admitting Arizona under a vicious Constitution. The President's argument against Arizona's Constitution is unassailable. He makes it clear that the recall applied to judges is a rod of terror put over them to compel them to follow, not the law as written, but the temporary and very possibly blundering feeling and passion of the people. For judges men are appointed who are supposed to be possessed of cool judgment and absolute impartiality. Such men should not be swayed by the popular storm. If they are all that an ideal judge would be they would decide according to their soundest judgment irrespective of the wishes of the people and heedless of any danger that they would be removed for doing their duty. But even judges are human, and they might in certain cases be influenced by the threat of removal. The two States ought to be admitted, but under conditions that do not threaten to defile the very fountain of justice. The judicial department of government is really chief of all, and must be kept above all political influence or control.

But the veto of the woolen bill and of any other tariff bills is rather one of politics. We doubt not that it is better to construct a tariff bill after the best of information from a commission of experts. But that has not been the way in the past. We did have one such, the Hayes Tariff Commission of long ago, which was not much considered in the final enactment of law; but usually the House of Representatives has called manufacturers and others to give it information.

The concocting of this present bill, as of the farmers' free list bill, has been wholly a matter of politics and not of science, and the veto of it is politics, and good enough reason or excuse is given for it. The Republicans praise the veto, and the Democrats and their allies abuse it, and say that it will be the political death of President Taft. This is not true. Before the nominations for President next fall tariff acts will be signed by the President which will do what these hasty bills have proposed, and most intelligently, and these vetoes will be forgotten. The tariff vetoes are good enough, but they have not the quality of that veto which has required a new bill for the admission of these two new States.

## The Shame of Pennsylvania

THE prevalent and distinctive crime of this country is murder. No other civilized country—for we have all the material civilization that the arts and sciences and wealth have to bestow—murders so many people. To be sure, the far larger proportion of these murders are in the South. Yet in the Northern States we

kill more people than does any European country. But in the most heinous forms of murder, and particularly murder by a mob, and murder by burning alive, we are alone and sole. No other country, civilized or uncivilized, is guilty of this extreme of horror. We have read that a cruel bigotry used to think it right to burn Jews and heretics at the stake, but that ended centuries ago. This special horror of murder we have made our own, and we carry it on now in this twentieth century since Jesus came to bring the love of God to men. We have added a new terror to it by depriving it of the forms of law and giving it over to irresponsible mobs maddened with passion. This is America's shame, that makes us hang our heads before the better nature of Europe.

Hitherto this form of murder, by a mob and by fire, has been local, and the victims have been negroes. The murders, with their added horror of burning alive, have been inflicted by members of a race which thinks itself superior, and the victims have belonged to a race which was called inferior. They don't burn white people alive even in the South; and murders by a mob have been very few in the North, and murder by burning alive has seemed impossible and unthinkable in these old Free States.

But now we have occasion to discover the infectiousness of evil. In Pennsylvania, close by the city of Penn and Brotherly Love, in the very seat of the Friends who hated slavery and believed in the Christ equally for all men, who have believed in the foundation of our liberties, that God has created all men equal, a furious mob has seized a wounded negro murderer from the unguarded hospital, tied him to a stake and burned him alive. A shuddering pen fears to tell the fact, but truth requires it. It is a terrible disgrace to the country, but most to the State of Pennsylvania, which has never before endured such guilt.

How could it be that such an inhuman crime could there be committed? They have laws fairly well observed, except when a spirit of lawlessness and violence has seized a less trained and educated portion of the people. To the spirit of Molly McGuire murders, to the violence of strikes, to the tolerance of industrial disorder reaching the limit of the destruction of property by dynamite and the assassination of those against whom a class feeling is aroused, we may attribute a portion of this aggravated excess of bitterness and lawlessness. Then it must be added that the reports in the daily papers of the burning of negroes in the South have made the vicious element familiar with the idea of such a crime. It naturally occurs to them, if violence is their purpose. In other places negroes are killed in this way; why not here? Thus an evil grows by the spreading poison of its own atrocity. It is of no use to say that the people were so angry with one who had killed a popular officer that he would have suffered just the same if he had been white. That is not true. It is only negroes that are so killed. If the felon had been a white man the mob might have hanged him to a tree, but they would not have burned him to death.

What will be done with these murderers? Such murderers have usually if not always suffered nothing, not even the twinges of conscience. They have rather boasted of their deed and treasured its mementoes. United States Judge George C. Holt has estimated that there are at least three hundred thousand of these murderers at large in this disgraced country. But this is in Pennsylvania, and we may at least hope that the Governor and the other officers will make most thoro investigation, and that a number of the guilty ones will be properly punished. This is the only atonement that can be made to outraged law. The guilty ones can be known, doubtless are already known. Punishment should be sure. There must be ringleaders, possibly dirty politicians, who ought to suffer. Justice will not be satisfied unless more than one is hanged, and the community is rid of a dozen others by terms of life imprisonment. Only by such stern measures can the repetition of the crime be prevented. What we fear is that it will spread like the cholera or the yellow fever. Now it has reached Pennsylvania. Next it will come to New York and Massachusetts. It must be quarantined. We show no tenderness to

infectious diseases, but we stamp them out. For the sake of humanity, of endangered civilization, let Pennsylvania do its duty to these barbarians.

## The Five British Dominions

"To be or not to be" was Hamlet's dilemma. A harder question is agitating the South African Dominion just now, namely how at the same time to be and yet not to be one of the British Dominions. Let it be understood in passing that they are no longer British colonies; they are five Dominions, and not so much under British dominion as under their own.

The question much discussed in South Africa and Great Britain—and likely to be a disturbing one in the other Dominions—was started by the Pretoria *Volkstem,* which represents the Dutch settlers, and which urged that in case of Great Britain being engaged in war it would be possible and might be proper for South Africa to declare her neutrality, and so take no part in the war. It said such a war might be one in which the Dominion would have no interest, and it might, indeed, be opposed to it. It was understood, it added, that in case of war, with Germany for example, the entire British fleet would be kept in European waters, and the Dominions would be left without any defense except such as they could themselves make; why should they be involved to defend Great Britain which could and would not defend them?

This suggestion appeared in the journal which was supposed to represent General Botha, the Prime Minister of the South African Dominion; but he, who is taking the cure at Kissingen, has hastened to deny that he inspired the article or agrees with it. The inspiration for it is attributed by some to the Canadian Prime Minister Laurier, who hastened to publish the agreement made at the Imperial conference between the Prime Ministers of the Dominions and the British Cabinet on the subject of the navies of the Dominions. The only really important point in it is, that in case of Great Britain being engaged in war "when the naval service of a Dominion or any part thereof has been put at the disposal of the Imperial Government *by the Dominion authorities,*" it will be under the command of the officers of the British fleet; that is, it is at the will of the Dominion whether its vessels of war shall take part in the war or shall remain at home. This right of refusal is not quite the same as the right to remain neutral, but it suggests it. It is clear that the five Prime Ministers, when attending the Conference and the Coronation, insisted on retaining control of their own ships of war even in time of war.

But the proposal to be a part of the British Empire and yet not to be a part of it in time of war is ridiculous and absurd. In case of war, who is to decide whether a British Dominion shall be neutral or not, the Dominion or the enemy? Certainly the latter. If in a war with Germany the latter Power were to be successful and should desire to rectify its boundary in South West Africa by taking in Bechuansland, Rhodesia and the Transvaal as "compensation," as it is now trying to rectify its Camerûns boundary at the expense of the French Gobûn possessions, what would Germany care for the South African "neutrality"? And we may add that no enemy would regard South Africa as neutral, whatever she might say, so long as the Imperial Government has spent $10,000,000 on a dock and dock-yard at Simonston as a base for the British navy. The rest of South Africa cannot be neutral so long as Simonston is British.

Further, it is not true that Great Britain would not and could not defend her Dominions in time of war. To divide her fleet between the Mother Country and the five Dominions in time of war would be to lose everything. Her navy would go where the enemy's fleet was, and fight it there, and there protect her oversea Dominions. South Africa can be attacked only by ships of war, and the British Admiralty would try by destroying the enemy's vessels to prevent their going there. Lord Selborne well says:

> "There is only one way in which any part of the British Empire can make sure of remaining neutral when the British Empire is at war, and that is by severing its connection with the British Empire in time of peace."

The bond which unites the five Domin

tions with the British Empire is a very loose one. It is mainly sentiment. They are separate and distinct for all practical purposes except those of war. They make all their own laws; they even make their own tariffs; they control their own navies. But they cannot make war, and they cannot escape a state of war if the British Empire declares war. To that extent—and it is a serious one—sentiment is effective. Perhaps it is worth while now; but how long?

## What the Automobile Stands For

THE latest statistics estimate the number of automobiles in use in the United States at nearly 400,000, while the vehicles that are drawn by horses are reckoned at 7,000,000. In automobile plants there are said to be invested $400,000,000, and in the operation of these plants and correlated trades 200,000 persons are kept busy. The builders of these 400,000 vehicles pay $60,000,000 annually for constructive material, and $25,000,000 for freight charges to the railroads. These figures are startling mainly because they have climbed up so rapidly.

The effect of the automobile is not readily seen, because its more apparent use seems to be for pleasure, and to gratify a passion for excitement. In reality this application of force has brought about, or is bringing about, a revolution in the more remote districts of the country. The reason why farmers have become eager buyers is because they are located out of reach of the ordinary means of rapid transit. The automobile belongs to the villages and smaller towns, where the railroads cannot reach, and from which they cannot be easily reached for travel or for freight purposes.

The banks, however, are uttering a united protest against what they call the craze of small investors to withdraw their investments, often adding borrowed money, to indulge in the purchase of automobiles. The farmers of the West find these carriages fill a deep need, where long distances are to be traveled. There is this thing to consider all the while, however, that when the farmer has brought his automobile back to the barn he cannot hitch it up for farm work. He must also have his horse or horses for plowing, cultivating, and all sorts of hauling. He is not fully equipped, as the townsman is, until he has both gasoline power and horse power; and this has to be taken into account when he considers the policy of expending several hundred dollars, or a possible $2,000.

What we specifically want just now, or what the countryman wants, who owns a few acres of land more or less, is an easily managed gas or steam motor that can do farm work of the sort we have specified. This will go a long way toward settling the economics of this problem. There are few farmers that can afford to indulge in a power that cannot be applied anywhere but in the streets. They might as well purchase a coach and four, while their income is better adequate to a team of mules. The application of electric power to field work, in a cheap and convenient form, is the thing now needed; and what is needed is bound to come. Indeed, the latest report gives us a motor plow operating a farm of 1,600 acres in Indiana. A gang of eight plows, behind which harrows are hitched, and all drawn by a gasoline traction engine, works at the rate of 3 to 5 miles per hour. The same motor is used for other farm purposes, such as threshing, or hauling the crops to market. The engine is a four-cylinder, 40 horse power, having a radiator and a fan to cool the engine, while it employs a magneto in the ignition. An engine of this sort can draw fourteen plows quite as well as half that number, having a pulling power of 7,000 pounds.

The report from this Indiana farm talks about plowing all night, by searchlights, we presume; while the work of thirty horses and fifteen men was being accomplished for twenty-four hours. The land is plowed to a depth of 10 inches, and an average day's work is 30 acres—at a cost of $2 a day paid to the engineer, four gallons of oil per day, and two gallons of gasoline for each acre plowed. It used to be said that a motor plow could not be operated on a farm of less than 160 acres; but at that rate those who own adjacent farms can work cooperatively. A single engine and a gang of plows could run half a dozen farms. The *Motor Age*, to which we are indebted, insists that the day is not far away

when we shall have gasoline-driven farm machinery of every description needed, and when every farmer's boy will be an adequate chauffeur. The steam engine has already been used for a good deal of farm work; now comes the day of the electric or the gasoline engine. If it becomes, as it promises to be, a world wide movement, the horse will be a rarity on the farm. We shall be compelled to withdraw our criticism of the automobile, or for whatever takes its place; as it can easily be made for traction or for travel, and also for farm work. Whether the same machine can be used in the road and in the field is not the question, but whether the power that is applied for traction can also be applied for work.

Speeding along the highway is not the end of this evolution or revolution of power for which the automobile stands. It is probably an incipient method of applying a power which has already largely displaced steam as an industrial factor and social organizer. We are confident that we shall soon get by the day of motor car display and speed madness, and get down to the construction of something more every day available, and reducible to the law of farm economics. Even if the automobile does not pay as yet, we are not sure that the farmer is making a mistake in getting into alliance with the new forces.

## The Wickedness of Witch-Grass

CHARLES DUDLEY WARNER did not half know the deviltry of witch-grass. He did not even know its name. He had to give it a name, and in his "My Summer in a Garden" he called it "bunch, or joint, or snake-grass," and again devil-grass. He gave only about a page to it, called it "original sin, or at least vegetable total depravity," told how it would run under ground, connect with a knot of roots, and if cut up at one place at the top grow up again at half a dozen places. That is true, too true, as every worker in a garden, particularly in a neglected garden, knows, but it is not half the truth about wicked witch grass. So Mr. Warner went to moralizing about cutting of the tops of sins and leaving the roots to grow, and offered the illustration to any clergyman (if orthodox) who wanted to use it, and would repay by a day's hoeing in his garden. Warner knew "pusly," for it is all obtrusive on the surface, but the wickedness of witch-grass is deep. Even our younger readers, who were not educated on "My Summer in a Garden," will know "pusly," for Warner's description of it has made his spelling so familiar that it has got into the botanical easy manuals as a name beside *purslane,* altho a city girl who was asked if she called it *pusly* replied that she always pronounced it *parsley.*

The best known sin of witch-grass which Warner touched on is its deep down depravity in running everywhere out of reach and from every joint ready to send up a shoot, and five for every one that is hoed down. That is a mischievous perversity, but it does not show the full enormity of its cruel nature. Every white-jointed root-stock prods forward with a sharp point, hard as an acacia thorn and merciless as Tamerlane. It goes straight forward and turns aside for nothing. It finds in its way a daffodil bulb and it turns out not a hair, but goes straight thru, with no care for what it may kill. It loves the rich garden earth, and when it finds the thick roots of the rhubarb it shows no more fear than it showed of mercy before. That spear-point is sped right thru, a foot below the surface, and there it has a hold which nothing can dislodge. It is the cruelest of all weeds, the degenerate, the ghoul of grasses. The pig weed grows taller but we can pull it. The rag-weed has its thousands of seeds, but a sharp hoe will scrape it off the surface when it is young, and a yank will tear it out when it is grown. The red-root will overtop any vegetable, but you need not cultivate or even endure the red-root. "Pusly" hugs the surface and grows fat with the sun, but watchfulness will save your beets and onions. But witch-grass is like those other miscreants who hide and spread under the surface of society and send out their blackmail letters and steal your children and blow up your home. There is no good in it, no mercy; it is utterly detestable.

And there are people just like it, people who delight in tyrannous cruelty. The police cannot find them. It is their

pleasure to conceal themselves, and to kill with dagger or dynamite. Charles Dudley Warner was right; it is snake-grass, devil-grass. Petrosino knew the human sort, tried to dig them out, but was stabbed by their stiletto point.

## Clerics as Law Makers

It is reported from Rome that Pius X has ordered all priests who are members of legislative bodies to resign, and also forbids any priest to be a legislator hereafter. This is a papal if unintentional plea for divorce of Church and State, for today lords spiritual still meet with lords temporal in lawmaking assemblies. Keeping up the custom of Catholic days, England gives a score or so—twenty-two, we believe—bishops seats in the House of Lords, where as a rule these spiritual peers vote against popular measures. On the Continent, the Duma has among its members Russian popes, as is clear from the attack recently made by one of them on Tchertkoff, the literary executor of Tolstoy. No doubt the parliament of Hungary has clergy among its members, for Strossmyer, the ablest debater in the Vatican Council, was a member of it. There it was that he mastered the self-control so needful in debate, which he showed amid the jeers and shouts of the Ultramontanes in the Council of 1870. Those present have told us that the Hungarian prelate stood with his hands thrust in his cassock pockets, wearing a smile on his face, while nicknames, insults and outcries of every sort were hurled at him. He only sat down when he had finished his speech.

Of the old prince-bishops, only two, as far as we can recall, still remain—the Prince-Bishop of Salzburg, in Austria, and the Prince-Bishop of Breslau, in Prussia. The former probably sits in the Austrian Parliament, but the latter's title is an empty honor. In Austria and Hungary many abbots still enjoy feudal rights. In a measure so does the Abbot of Monte Cassino in Italy, who is the squire of that hill, but has no seat in the Italian Parliament. In the recent discussions in Spain over the Concordat, the Archbishop of Toledo and the Bishop of Madrid took active part. Both these are members of the Cortes, to which may belong more bishops. In the English House of Lords sat a Catholic priest, Lord Petre, of the same family as the gentlewoman, Miss Petre, the executor of Tyrrell, whom Rome now casts forth. But Lord Petre sat as a lord temporal—the head of his house. He died some years ago. Again, in the parliament of Holland was a Dutch priest a member, but he too, we believe, is dead. There remain but four priests who are members of other European parliaments: the Abate Murri in the Italian, who, however, counts not, as he is by name *excommunicatus vitandus;* that is, under the Church's most direful ban. In the Reichstag of Germany is a priest, delegate from Alsace, and in the French Chamber of Deputies are the two other priests, Lemire and Gayraud. The former is a liberal of the Gratry-Lacordaire school, and a man of exemplary life. The other is an ardent Ultramontane and not much else. The Alsatian priest can hardly be affected by the Pope's order, which again will not concern the various bishops in parliaments, this because of concordats; in the cases of the latter the concordats with their respective countries; in that of the Alsatian in the Reichstag, the Concordat of Napoleon in 1801, for that is still in force for the annexed provinces of Alsace and Lorraine; unless perhaps with the connivance of Wilhelmstrasse the Alsatian may have to go, for not long ago he made a speech not over palatable to the Prussian authorities. Hence the papal prohibition seems to affect only the two French priests who are deputies. Once more a slap at France.

This matter of clerical legislators occasions curious thoughts. With all their influence the priests of Ireland have never sent one of themselves to Parliament. There would be no difficulty whatever in the Catholic provinces—Leinster, Munster and Connaught—of choosing a bishop or priest for the House of Commons. And yet, priests attend conventions, make speeches, and electioneer for the Nationalists. In Canada it is the same. The French clergy there might easily send some of their number to the Provincial and Dominion Parliaments. But we believe they do not.

Here in the United States it is the

same. There are districts where a Catholic priest might be chosen to a city, State or national legislature. Some have been elected school commissioners even in New England. But only one ever sat in Congress—the Sulpician Richard, who was a member from Michigan. His statue, we believe, adorns one of the public squares of Detroit. The present Mayor of New York is an ex-Christian Brother, but such is in the Church's eye a mere layman, for to be a cleric one must receive the tonsure, which the Brothers never get. If we turn to the other Churches in our country it would be an interesting study to know how many preachers and ex-preachers have been elected to office. We remember two, one a Methodist and one a Congregationalist, who were in the Massachusetts Senate together fifty years ago, and we recall a Western minister in the United States Senate. One Episcopal bishop—Polk, of Tennessee—threw aside the staff and took up the sword, as a general in the Confederate army during the Civil War. But he was not a legislator. Clergymen serve on all sorts of commissions. But, on the whole, they count for very little in the executive, judicial and legislative functions of government, and less still in the country's financial affairs. And yet, while the Churches, Roman and the others, retire further and further into the sacristy and vestry, they enjoy and make use of a political activity which not always bodes good for them or the state. The most potent example now is that of the Federation of Catholic Societies suggesting the Government's action in regard to the republic of Portugal. Again it is seen in State grants and State exemptions, which have become almost part and parcel of our civic life.

**The Negro Vote on Prohibition**

The assertion is made that in Texas, where the chief interest was in the State-wide prohibition contest, 85 per cent. of the negroes voted against prohibition. That is an easy assertion to make but we would like to know how the poll was taken. The point made is, that the amendment was defeated by only 5,000 in a poll of 450,000, that an overwhelming majority of the negroes voted against prohibition, and that therefore negroes held the balance of power, which is most unfortunate, and that they ought not to vote at all. We doubt the figures. Perhaps we will be told how many negro votes were cast, and perhaps some blame may be put on the 200,000 white voters who went for liquor, including thousands of Mexicans. If it be true that 85 per cent. of the negroes and all the Mexicans voted for the saloon it means that the temperance people should plow those fields. The negro preachers should be urged to press the evil of the saloon. In fact, already we gather that their religious organs are on the temperance side. The *Nashville Tennesseean* says that in its State an equal 85 per cent. of the negroes are against prohibition. Again we doubt it, and we remember that there were other reasons why Tennessee negroes voted for a Democratic Governor. We have information that in Atlanta there is a large negro vote against the saloon. Let this be understood, that if the saloon politicians cultivate the negro vote and the anti-saloon men hold themselves too high to do it, they will have no right to complain if they are beaten by the negro vote.

**Electric Traction**

The growth of electric traction is rapid, and it seems inevitable that it will replace steam before many years. In Prussia the entire system of railways, belonging to the State, is to be electrified, and governmental appropriations have already been made to that effect. Twelve and a half millions will begin the work. France has a number of short lines electrified, and in England the London and South Coast Railway expects to have its entire lines electrified by 1916. In Norway and Sweden as well as Switzerland and Italy the proposition is simplified by the abundance of available water power, and a good deal of progress has already been made, especially in Switzerland. In this country the suburban branches of the Southern Pacific road are undergoing electrification. The New York, New Haven & Hartford Railroad is extending its work, and the Pennsylvania Railroad has its terminals in New York under operation with electric power. Two or three of the largest

roads, such as the Pennsylvania, are discussing the feasibility of electrifying their trunk systems at once. In the Carolinas the Piedmont Traction Company has decided to electrify 140 miles, in two sections, one of them in North Carolina and the other in South Carolina. There is no question but that the adoption of electric power in the place of steam will largely assist in extending branch systems thru the country, where water power is abundantly furnished from the hillsides.

**County Fairs**

We are coming to the annual fair season, and for the next two months these exhibitions will draw the crowds. These fairs, if properly adjusted to modern times, would be of vast use, but a chaotic crowd, rushing hither and thither, with open mouths for side shows and money to spend on the vaudeville, means little or nothing in the way of social betterment. We imagine that the horse racing is not even intended to make the slightest impression in the way of horse improvement. Dean Bailey, of the Cornell School, has recently recommended a program of reorganization, looking to the creation of a new sort of county fair, something that shall really represent the farming interests and be of service to the people. He would have all concessions to midways and side shows lopped off as soon as possible. Greater effort should be made to secure exhibits of local farm stock and produce; of things pertaining to homes and home life, to school and school life, to farmers' clubs and granges. It is his opinion also that good games and sports and contests, showing the recreational side of farm life, should be made an important part of every fair. Here seems to be something worth the while, something in which every farmer and his family could take part. Coincidentally improved rural schools and rural home life would be likely to spring up. They are coming about anyway, and the fairs should illustrate this progress. The redirection of school work is going to be of great advantage to the farmer, while it doubles his responsibilities. The fair should illustrate the school and school work. Then, to follow out this idea still farther, the dean would have every farm definitely set aside a portion for the young folks; that is where they might plant their own ideas and test their conceptions begotten in the schools. There are few farms that could not give a half acre, where the young folk could plant whatever they chose, test fertilizers and study new varieties. This is a natural way of carrying out industrial education; let it revolutionize the schools, but at the same time revolutionize the farm homes. Growing children is a part of farm work, and a good deal more important part than growing cattle or incubating chickens. The schools and the homes improved, let the fairs specifically exhibit the improvement. Give the schools and the homes a definite part in the exhibition.

**Togo's Views**

Admiral Togo has given a new significance to the colloquial banality which recites the undisputed fact that "we have a good deal to learn from the Orientals." The Admiral has set a new standard for newspaper interviews, so praiseworthy from every point of view that to speak of it in terms of exaggerated compliment would be difficult. Assured that an expression of his views on several subjects would be of interest to the American people, and doubtless wishing to conform as nearly as possible to the customs of the country, he consented to be interviewed by an enterprising reporter, provided the questions to which it was desired he should reply were submitted to him in writing and that he be permitted to answer them in the same way. The questions were thirteen in number. After due consideration the wise Admiral was able to answer seven of them with a single word each. Two of them called for two words each, and one seemed to require three words. His most exuberant outburst of garrulity, in which he summarized his impressions of his reception by the American people and his high appreciation thereof, required seven words. The whole interview, as printed in the New York *Times*, is as follows:

WHAT ARE YOUR IMPRESSIONS OF The President?
Ideal.

The Naval Academy?
Magnificent.
Congress?
Grand.
Mount Vernon?
Beautiful.
American battleships of the "Utah" type?
Excellent.
The new naval 14-inch gun?
Powerful.
The Government Navy Yards?
Very good.
American railroads?
Comfortable.
American hotels?
Up to date.
Reception in America?
Very warm, for which I am grateful.
(1) The effect in Japan of President Taft's complimentary reference to the Mikado. (2) Will it further cement the friendship of the two nations?
(1) Will be very good. (2) Cannot be otherwise.
American newspaper photographers?
Very enterprising.

There is ground for suspicion that the Admiral is something of a humorist; but however this may be he has certainly set an example of lucid brevity which some of our own people might imitate with advantage. The danger to reputations and political aspirations is not in expressing opinions, but in saying too much by way of amplification and explanation. Togo has established a new record for discretion. Evidently he is a great man—even greater than we had supposed. The "golden silence of the Greek" was admirable, but the radioactive concentration of the "Jap" better meets the requirements of this age of voluminous intercommunication.

**Village Histories**

Few are the points of view that possess novelty. Almost a hundred years ago an American missionary, traveler and novelist wrote:

"A fair history of the society of a country village would be a thousand times more interesting than a novel; and, besides the interest of the picture, it would be one of the most useful views of society that can be presented."

The Rev. Timothy Flint exprest this highly modern opinion. Since his day a good many writers have tried to draw such a picture—and there is room for more attempts yet, in spite of the work of fiction writers like Thomas Hardy, and J. M. Barrie, and Mrs. Deland, and the late Sarah Orne Jewett. Men and women make cities, but villages make the men and women

**Politics and Song**

American political campaigns have not furnished food for the Muses in recent years. In Toronto, however, Mr. George L. Waterbury, a disciple of William Henry Drummond, contributes to *The Globe* a poem entitled "Le Habitant Parfait":

"Wan leedle man, ver' cool, ver' calm,
Ees come for spik wit' us.
Have holes for puncture all the tam
Zees annexation fuss.

See heem, so quiet, so collec',
He trus' Canadian sense;
By gar, I laugh to see heem wreck
Zees barb-wire tariff fence!"

"Wan leedle man" is, as it happens, Sir Wilfrid Laurier. The Premier is the first French-Canadian to have filled that post. To judge by indications, the reciprocity campaign will only strengthen his hold on the position.

**A School Advertisement**

Reading the school advertisements of the season we have imagined the following to be something of an ideal: This is a school for both sexes, for we believe Nature's arrangement in the family cannot be improved. Our school will be a family in every sense of the word; the pupils for the time being are adopted. We will accept only fifteen pupils of each sex. We will not undertake to fit for college, only for home; and we shall hope that our graduates will be specifically prepared to go back into the family life with better fitness for home making. We shall aim to prepare our pupils for the high arts and for the simpler sciences that enter into modern everyday life. To be scholars of Nature and human nature is our first aim; of books the second. We shall honor culture, but intellectual power more. Believing that a wholesome body is essential to a wholesome mind, we shall aim to educate both body and mind together. We shall live out of doors forenoons, thinking, studying, working and learning of Nature; but afternoons we shall spend with books. Evenings there will be no studying; but there will be music, lectures, debates and reading. Our vacations will extend from Decem-

ber 15 thru the holidays to January 15, and from July 1 to September 1. Our terms will be cheerfully made known to all those who approve our program.

**The Chestnut Blight**

The Superintendent of New York State Forests, C. R. Pettis, is sending out circular letters, to find out all he can about a disease that has attacked chestnut trees. It begins at the top of the tree, shriveling the leaves and giving them the appearance of autumn in midsummer. Then come cankers and swollen spots on the limbs and trunk. Death of the whole top of the tree soon follows, and then the rest of the tree does not survive many seasons. The bark of the dead tree will be found to be covered entirely with reddish-brown bodies. We cannot afford to lose our chestnuts, and here is a case where the public is invited to take hold with the superintendent and come in ahead of the enemy, whatever it may be. We lost our white weeping birches all over the country thru the work of the yellow-throated woodpecker. This elimination of one valuable tree and giving its room over to some other kind of tree has sometimes a tremendous influence on human industries. The pecan industry is threatened in the South, and now the chestnut faces annihilation in the North. Another authority from Pennsylvania claims to have found the chestnut blighter, in the form of a small beetle one-sixteenth of an inch long. These lay eggs inside the outer bark, and the larvæ eat the soft inner bark. The Legislature of Pennsylvania has appropriated $275,000 to aid in exterminating the pest, whatever it may be.

**Premature Protection**

In diplomatic affairs it does not do to overlook the important factor of timeliness. A trifling accidental delay often upsets a predetermined coincidence and produces a reversal of the temporal relations of cause and effect that is disconcerting to the logical historian. The Kaiser's *coup* in Morocco was spoiled by a slip of this kind. The sudden dispatch of the gunboat "Panther" to Agadir to protect German lives and property from Moroccan disorder aroused some surprise, which was natural, because there was not a German in the vicinity and no German property except prospects and no disorder. Who among the three or four hundred natives dwelling at that deserted port had sent to the Kaiser that pathetic appeal for rescue? Now we know that the apparent discrepancy was due to a mere accident such as might happen to anybody. The German pioneer of commerce who was supposed to be there and to be in danger had been delayed on the way so he did not arrive at Agadir until some time after the gunboat and cruiser which the Kaiser with commendable promptitude had sent in response to his cry for help. Here is a case, one of the few on record, where the trade followed the flag. The French and the Spanish movements in Morocco were almost as unfortunate. The only reason the Spanish could find for occupying Larache was that a few natives on horseback had approached the city walls one day and fired off their guns. Since this is the ordinary way of saying "How dy do" in Morocco it is not necessary for us to give credence to the rumor that the party was personally conducted by a Spanish agent. And think how we held our breath all one week and trembled with fear lest General Moinier should not arrive in Fez with his "relief" expedition from Casablanca in time to save that city from fire and sword. But when the brave rescuers got there they found the foreign residents alive and well, pleased tho surprised to receive them. Another unfortunate incident of this kind occurred in December, 1899, when the telegram calling upon the chivalry of England to save the white women of Johannesburg from massacre by the Boers was delivered at the wrong moment. The women were quite unaware of their danger at the time and the mistake marred the perfection of the Jameson raid.

**North and South**

A contributor to the French journal, *L'Opinion*, has recently shown that the capital of France is Paris no longer, but Souillac. It is at Souillac that M. Malvy, of the new cabinet, has a fine château. It is Souillac that is the center of the electoral fiefs of President Fallières, of the Prime Minister, M. Monis, of the Baron

d'Estournelles de Constant, M. Chaumet, M. Jaurès. During the last five years France has had seventy-nine ministers; subtract three Algerians, and, of the remainder, half come from the region to the south of Souillac, from the Gulf of Gascony to the Mediterranean—only about a fifth of France in area, with a population of only six million. *L'Opinion* asks the explanation of this domination by a minority, and M. Henri Poincaré, the mathematician, answers that the qualities of a public man are of two sorts: those which aid him to rise to power and those with which he puts power to a good use. The south of France turns out politicians who have the first set of qualities in an extraordinary degree. The politician from Gascony or Provence is eloquent, prompt to promise, and all the more persuasive of others because he knows how to dupe himself. These are incomparable advantages for a politician, French or American. The south of France has a weak representation in the learned academies of Paris, but at the Palais Bourbon its delegation is as strong as ever. M. Joly, of the Institute, suggests that the success of the Southerner is partly due to his expansiveness, but also to his preparation for the legislative hall in the cafés of his province. Certainly it is true that nowhere is café life more fully developed than, say, at Toulouse, where university student and mayor and lawyer and journalist know every one and are known to every one. It is different with the cold nature of the North: The Northerner goes to the French Chamber knowing no one, and himself harder to know than is his competitor. The hardest word about the south of France and its representation in the Chamber and Senate is spoken by the great geographer, M. Vidal de La Blache. "The less a country is advanced in economic evolution," he says, "the more it is tempted to make a career of politics."

**Is the Papal Election Veto Ended?**

Recent cable despatches announce that Pius X has abolished the veto, enjoyed by certain countries, which gives them the right to bar a candidate for the papacy. As customary in all such documents, the direct question is left untouched. Pius X merely excommunicates any cardinal attending the Conclave who ventures to accept the charge of vetoing a candidate. Now, three nations—Austria, France, Spain—enjoy the right of veto. Probably it is an open question where Separation annuls France's veto; it is, however, more than certain that France will not use it; that is, officially and above board. Austria employed it effectually to shut out Rampolla when Pius X was elected. Austria had sent a veto against Pius IX in 1846; but the messenger reached Rome too late. Both Austria and Spain enjoy the right even today. The Vatican in the new regulations strikes only cardinals in Conclave, and leaves the rights of those two Catholic nations untouched. It all is a cheap bit of casuistry, which will go to pieces before the action of either nation. Or if Austria or Spain acquiesce, it will be for some ulterior motive, e. g., abolishing its Concordat or altering parts thereof. Once Pius X is dead—and his death seems not very distant—his decrees will count for very little. We therefore ask: Is the Papal Election Veto ended? We believe not.

The millionaires are not all Americans, neither are those that leave their wealth for the betterment of the world. It is pleasant to hear of a Greek resident in London who has left a property of about $2,500,000, nearly all assigned by his will for the benefit of Greece, particularly for education, hospitals, draining of marshes, the comfort of the men in the national army and navy, and the embellishment of Athens. There may yet be a great awakening for Greece, as there was for Italy at the end of the Dark Ages

John Hays Hammond, who knows South Africa, says the mines there will produce $200,000,000 of gold next year, and continue to keep up to that mark or higher. A part of that amount will go into the arts, but the most of it will go into circulation, increasing the currency based on gold faster than business increases. It is not strange that prices based on gold are constantly rising, and all employees are demanding higher wages.

# Insurance and Finance

## Trickery Uncovered

Readers of our discussions of "The Poor and Insurance" in our issues of the 10th and 17th inst. will be interested in the report of the examiners representing the various supervising insurance departments of the country on the German-Commercial Accident Company of Philadelphia, Pa. This was recently made public at Detroit, and contains the following significant summary:

"A thoro examination of the claims indicates that over sixty per cent. are compromised or scaled by this company. The correspondence, in a great percentage of claims, is voluminous and of a haggling and bargaining nature. The moment the company is advised of either an accident or illness case, and especially where the cases appear to be of a serious nature, it uses a high-pressure system to adjust claims at once, practically forcing the claimant, by shrewd ingenuity on the part of the agent and the physician, to settle before illness ceases or length of disability is determined."

Here is an extract from the accident company's correspondence with its agents:

"We might say, for your information, that this is the opportunity for you to demonstrate your ability, and also demonstrate that it is your purpose to hold down these claims to a proper figure. You know the man is a foreigner."

Fortunately, the day of this kind of business is gone by, and its managers know it. This Philadelphia company is a small one, its industrial premium income in 1910 being but $21,000.

THE Nineteenth Ward Bank and the Twelfth Ward Bank have been merged into the Fourteenth Street Bank of this city, of which R. Ross Appleton is president. The new name of the enlarged bank is The Security Bank of New York, and the main office as heretofore will be at the corner of Fifth avenue and Fourteenth street, with branches in other parts of the city. The resources of The Security Bank are $16,000,000, and it is closely affiliated with the Fourth National Bank, whose resources are $60,000,000, and whose president is James G. Cannon.

NOT long ago we told of George H. Furbeck, of St. Joseph, Mo., and his collection of over $20,000 from the Travelers' Insurance Company, of Hartford, as compensation for the loss of an eye in a somewhat unusual street-car accident. We have just learned that the Fidelity and Casualty Company of New York also had issued an accident policy to Mr. Furbeck, and paid him $15,103.58 on account of this same accident. Once more is the proverb of "a stitch in time" exemplified, for if the accident could not be averted, at least some of its worst consequences were avoided.

IT is estimated that there are at present 500,000 licensed automobiles in the United States. The premiums for fire and theft insurance amount to over $17,000,000, for collision insurance $15,000,000, and for liability insurance $22,000,000. The value of all licensed cars is placed at $500,000,000 and the annual tire expense at $50,000,000.

A LIFE insurance company in Tennessee with over $3,000,000 of policies in force reports no deaths during the first six months of 1911. That is rather a different story from the enormous losses our great fire insurance companies have had to pay.

A NEW and ingenious automatic fire alarm has recently been tested. The device consists of a small hollow tube in which the air, expanding by heat, presses a copper diaphragm against an electrical connection and rings the alarm.

THE Great Lakes Steamship Company will hereafter carry its own insurance. Provided there are no losses this will effect a saving of $250,000 a year.

DURING a recent month 2,616 persons were injured on transportation lines in New York City. The seriously injured numbered 164.

The Independent

VOL. LXXI NEW YORK, THURSDAY, AUGUST 31, 1911 No. 3274

# Survey of the World

**Congress Adjourns**

The special session of the Sixty-second Congress called by the President to consider reciprocity with Canada ended at three o'clock on the afternoon of August 22. Before adjourning, the House of Representatives received from the executive a veto of the cotton bill passed at the last moment by the Democratic House and by the insurgent Democratic coalition in the Senate. Mr. Underwood, the House leader, remarked that since he could not command a two-thirds vote he would move that the veto be referred to the Ways and Means Committee, where it will lie till Congress reassembles in December. Champ Clark, Speaker of the House, states that at the extraordinary session his party has made a record which surprises its friends and dumbfounds its enemies:

"It has put heart and hope into Democrats everywhere. . . . We are more thoroly united in the House at the end of the session, if possible, than at the beginning. . . . We passed thru the House more constructive legislation, and better, than has passed thru any House in the same length of time in twenty years."

The minority leader in the House, Mr. Mann, on the other hand, said in part:

"The Democrats in the House would have been wise if they had confined the special session to the consideration of the reciprocity bill only. Instead of that they set out to show how they could bungle legislation. They prevented the passage of the constitutional amendment for direct legislation of Senators by insisting upon coupling with it another amendment to the Constitution to deprive the general Government of one of its necessary powers."

*

**What Congress Did**

The special session added four important measures to the statute book. These were Canadian reciprocity; the law which obliges candidates for either branch of Congress to file statements of their expenses whether in general election, primary, or nominating convention, not more than fifteen days nor less than ten days before the election or nomination, with the expenses of candidates for the Senate limited to $10,000, and those of candidates for the House limited to $5,000; the reapportionment act, by which the House membership is extended to four hundred and thirty-three; and the act granting statehood to Arizona and New Mexico. (A conference of House and Senate committees prepared, after the President's veto of the original statehood bill, one which omitted the recall-of-judges feature: this was signed by Mr. Taft.) A New York newspaper's Washington correspondent writes: "'Put Taft in a hole,' was the cry of both Democrats and insurgents from the very beginning of the special session, and thruout the tedious six months of legislative effort." The Democrats believe that they have done so, in making reciprocity with Canada possible, and in putting bills for the revision of the wool, cotton, metal and chemical schedules, as also the farmers' free list bill, before the President, to "draw" his veto. The question arises, however, whether the Democrats have not committed themselves to the protection policy in accepting the La Follette bill for wool revision, for the President has announced that he will recommend a revision of this and other schedules at the next session, and if he should recommend wool revision based on a 35 per cent. duty for raw wool (Senator La Follette's rate), can the Democrats very gracefully refuse to accept it? It is even possible that the President's Tariff Board may recommend a more drastic reduction than that demanded by the junior Senator from

Wisconsin. A Washington correspondent hostile to the Republican insurgents writes of their record at the special session:

"The President has had the satisfaction of seeing the inconsistencies of the insurgents in the Senate exposed in such a way that even their own supporters have ridiculed them. Not only on Canadian reciprocity, but on the tariff legislation of the session just ended, were the insurgents smoked out and their inconsistency established as a matter of public record."

——An important incident of the session was the repudiation of Mr. Bryan by the House of Representatives. The Democratic House leader, Mr. Underwood, openly made war on the Commoner, and the House gave him its support. Mr. Underwood as leader has eclipsed Mr. Clark as Democratic Speaker, one may add.——The numberless "investigations" undertaken or planned by the majority in the House have not "panned out." They were designed to furnish campaign material for 1912. The steel and sugar investigations have turned over a vast deal of recorded history, which not even the journalistic mind has made much of.——The investigations of Senator Lorimer's election will be continued at the next session, and Senator Stephenson's will be reported upon.——No conclusion of the Wilson-Wiley-McCabe case has been arrived at. ——Three treaties were ratified by the Senate. These were with Great Britain, Russia and Japan, providing for the protection of fur seals; an extradition convention with Salvador, and one relating to the pecuniary claims between this country and Great Britain. The Honduras and Nicaraguan treaties and the general arbitration treaties with Great Britain and France have gone over until the next session. The resolution providing for the direct election of United States Senators suffered a similar fate.

**What Congress Cost**

The special session was, according to a statement made by John J. Fitzgerald, of New York, chairman of the House Committee on Appropriations, one of the most frugal in our history. Mr. Fitzgerald points out that no new jobs have been created by his party, while sixty-five have been abolished. Hitherto an extra month's pay has been voted to the officers and employees of the two Houses. This the Democrats have refrained from doing.

"The present session," said Mr. Fitzgerald, "has lasted more than four months. During that time Congress has appropriated $301,052.20. Of this amount appropriated, $141,000 was necessary to meet the expenses incident to the session of Congress. Of the other $160,000, $150,000 was to meet contract obligations for the rebuilding of the army supply depot at Fort Mason, Cal., which must be met by October 1, 1911. This should have been appropriated by the last Congress."

"The net result is," concluded Mr. Fitzgerald, "that Congress has appropriated $301,052.20. It has repealed appropriations aggregating $347,650, a saving of $46,597.59. In addition it has declined to appropriate $140,795 as extra compensation for employees of Congress, and a Democratic House has reduced its payroll in the sum of $111,443.28, so that the total saving in money as a result of the enforcement of Democratic policies during the present session of Congress is $308,836.67."

**Mr. Fisher in Alaska**

The Secretary of the Interior is visiting the Alaska coal fields. At Cordova a memorial was presented to him asking that the coal lands be sold in the same manner as other Government lands. The memorial sets forth that the withdrawal from entry of the coal lands has paralyzed progress in the Territory. Mr. Fisher answered by assuring the Cordovans that he would give Alaska the fair treatment accorded any other part of the country that came under his jurisdiction. The Secretary of the Interior has inspected the Guggenheims' and Mr. Morgan's mines at Kennecott, said to be the richest copper mines in the world. A dispatch from Tacoma to a New York newspaper friendly to the Morgan interests says:

"Three days spent at Katalla convinced Secretary Fisher that injustice has been done the people interested in that region both in long deferred action touching the claimants' rights and in the gross manner in which the coal fields have been misrepresented. Secretary Fisher saw coal measures and heard of others, but he did not see a single piece of solid coal as large as a hen's egg, because all accessible coal in the Bering River field has been ground to powder by some contortion of underlying and overlying strata."

**The Campaign in Canada**

Reciprocity is regarded as the winning issue at Ottawa. "Let the farmer have his turn," is the Liberal slogan. Frank Oliver, Minister of the Interior, says, however:

"There is no doubt that the Eastern manufacturers must benefit by reciprocity. If the Western producer has more money to spend . . . the Eastern manufacturer must inevitably benefit by the pact."

President Taft is scarcely less prominent a personality in this campaign than Sir Wilfrid Laurier and the Conservative leader, Mr. Borden. His declarations in favor of reciprocity, especially the statements, "Canada is at the parting of the ways," and Champ Clark's breaks, are used by the opposition as campaign ammunition. The opposition tries to read disloyalty into reciprocity, but the liberal press only bids Mr. Borden to "go to Halifax," and tell his own constituents that free trade in fish is treason. Sir Wilfrid himself has gone to the Maritime Provinces, having finished the campaign in his home Province, Quebec. In one of his speeches he has promised to quit public life if he is defeated. "Rest to me is very sweet," he adds. Annexation talk is not taken seriously as an argument by all appearances. Popular interest in the approaching general election is indicated by an uncommonly heavy registration. An exceedingly stormy debate between Mr. Lemieux, of the Liberal ministry, and Mr. Bourassa, leader of the Nationalists and grandson of Louis Papineau, lately occurred at St. Hyacinthe. The general election is not a mere referendum on reciprocity. If it were that the voters of Canada would have only one question to answer. In the campaign now opened there are several issues alien to reciprocity which the opposition exploits to the full. Graft is one of them; the navy and what Mr. Bourassa calls "ultra imperialism" another; the census and reapportionment, with the Government's alleged injustice to the Western Provinces, constitute another issue. Redistribution would greatly strengthen the West politically. But reciprocity is so manifest a benefit to the West that the Government hopes the farmers will not show impatience. Quebec and Ontario provinces are regarded as likely to decide the contest. Each side charges the other with being subsidized by the Americans. The polling day is September 21. The twelfth Canadian Parliament will be opened October 18 or 25 by the new Governor-General, the Duke of Connaught.——The Canada British Association has been organized to fight reciprocity. It proposes to flood the country with literature presenting arguments against reciprocity. The Canadian National League and the Manufacturers' Association are equally active. ——The *Berliner Tageblatt* protests against the United States admitting duty free certain Canadian products prior to the ratification of the reciprocity treaty by Canada. It characterizes such action as a direct infraction of the German-American trade agreement.——Steps looking to the establishment of news paper and pulp mills in Canada are being taken by the International Paper Company of America.——Venezuela has contracted with a representative of the Canadian-Venezuelan Ore Company, of Montreal, ceding to the company the Imataca iron mine, which was part of the famous Fitzgerald concession. The Montreal company will immediately exploit the mine on a large scale. The contract with the Government compels the company to deepen the bar of the Orinoco River and build a lighthouse. The Orinoco company, which formerly held the Fitzgerald concession, forfeited it in 1909 under the protocol signed by the late William I. Buchanan, then Special American Commissioner in Venezuela.

**Disasters**

Thirty-seven persons were at first reported to have been killed in the train wreck near Manchester, N. Y., on the Lehigh Valley Railroad, August 25. Up to Monday, however, there had been only twenty-eight deaths, with several more of the seventy-four persons injured likely to swell the death roll.——On Sunday many persons were injured in a wreck on the New York, New Haven & Hartford Railroad, near Middletown, Conn. This wreck was brought about by the loosening of bolts by persons unknown. Only the engineer suffered serious injuries in the derailment of a passenger train near Kirkwood, Ohio, on the same day.——Twenty-six lives were lost in a moving picture show fire panic at Canonsburg, Pa., on the night of Au

gust 26. Others suffer from serious injuries. The steps leading out from the Canonsburg Opera House were only 6½ feet wide, and were the scene of a brutal battle between theater-goers who had lost all self-control.

**Aviation**

Harry N. Atwood, the young Boston airman, landed at Governors Island at 2.38 on the afternoon of Friday, the 26th, having covered in his machine the distance between St. Louis and New York City. Here are some particulars of his trip:

Distance covered in air line, 1,265 miles.
Total distance, including detours, 1,365 miles.
Started from St. Louis 8.05 a. m., August 14.
Finished at Governors Island 2.38 p. m., August 25.
Flying time for entire trip, 28 hours 31 minutes.
Number of flights en route, 20.
Average distance of each flight, 63¼ miles.

This trip beats the previous world's record by 101 miles, even if we do not credit Atwood with the extra 100 miles for detours. The best previous cross-country records are as follows: Herr Koenig, German circuit race, 1,164 miles; André Beaumont, European circuit, 1,073 miles. Atwood declares that "flying is too risky" and that, after the Boston meet is over, he will practise no more of it. He made the St. Louis-New York trip for a $10,000 prize.——From St. Louis it is reported that plans for an aeroplane flight of at least 1,500 miles down the Mississippi River in September, to eclipse the world's record just established by Harry N. Atwood, are well under way. Two courses are under consideration. One is from St. Paul, Minn., to Vicksburg, Miss., 1,511 miles. The other is from Dubuque, Ia., to New Orleans, 1,555 miles. The purpose of the projected flight is to focus attention on the Mississippi on the eve of the deep waterway convention at Chicago, and to promote aviation interests in the Middle West, as well as to establish a new world's record for distance.——The second Harvard-Boston aero meet opened at Squantum Field August 26. Claude Grahame-White, the Englishman who won last year's meet and later won the Bennett Cup at Belmont Park, took two first prizes. For the first time he used a Nieuport monoplane. He ascended 3,000 feet in some seven minutes and did eight laps of the mile-and-a-half course in 12 minutes 6⅕ seconds, winning both the altitude and speed events. Thomas Sopwith, the Englishman who carried off many prizes at the recent Chicago meet, won the quick-starting test in 11⅘ seconds, and was second in bomb-throwing. Miss Genevieve Leonard, of Boston went up with Sopwith in this event, handing him the bombs. Howard W. Gill, a Wright flyer, with a Burgess-Wright machine, was first in the bomb-throwing. ——A young airman named Helles has broken the long flight (Michelin) record scored by Vedrines, who covered 800 kilometers (496.8 miles) in 7 hours 56 minutes and 36 seconds. M. Helles flew over the Marmelon course, landing at Chalons-sur-Marne, France, traveling 1,200 kilometers (746 miles) in fifteen hours.

**Latin America**

As a result of the mustering out of General Zapata's rebel troops at Cuatla, nearly two thousand dynamite bombs, several hundred modern Winchester and Mauser rifles, with hundreds of antiquated firearms, have fallen into the hands of the Mexican government. As a result of the raids upon haciendas and the looting of stores in Jojutla, in the southern part of Morelos, the Spanish plantation managers and owners have appealed to their Minister, Señor Don Bernardo Cologan y Cologan, to demand protection of the Mexican Government. The stores of Spanish merchants are said to have been looted when property of Mexicans was left untouched. Francisco Mendoza, one of the leaders of General Zapata's revolutionary army, and a band of followers are said to be responsible for the depredations.——The Ecuadan Congress has declared Gen. Emilio Estrada to have been legally elected President of the Republic, having received 100,000 votes more than Gen. Flavio Alfaro. Order has not yet been wholly restored.——It is said that satisfactory arrangements have been concluded between Colombia and Peru to prevent further encounters between the troops stationed at the frontier near Caqueta. Colombian residents in Panama

have offered their services to their Government in case of war.——Again a plot against the Government of Honduras is declared by General Bonilla to have been unearthed. Agents of Zelaya are held responsible for it.——José Maria Villaverde, the general manager of the Conservative organ *Cuba,* and his nephew Manuel, a member of the editorial staff, were deported on board the steamship "Alfonso XIII," which sailed from Havana for Spain August 20. This was done by virtue of a decree issued by President Gomez, declaring them to be pernicious foreigners prejudicial to the permanence of the Cuban republic. The elder Villaverde has lived forty-five years in Cuba, and his nephew was born a Cuban. Their expulsion is denounced by most of the newspapers. It may now be annulled, there being rumors at Havana of a Spanish protest. The newspaper *Cuba* has been criticising the Government, tho less aggressively than has *El Dia.* But André, the editor of *El Dia,* is a native Cuban and a member of Congress, and cannot be expelled, altho the suppression of the journal is rumored to be imminent. It is alleged that there is nothing in the Cuban Constitution warranting a deportation of this nature, tho it has precdent.——In all, the remains of twenty-three men have been taken from the wreck of the "Maine."

**The English Strikes**

In accordance with the agreement arranged by Chancellor of the Exchequer Lloyd-George, the strikers returned to work pending an investigation by a special commission. The Government appointed as representatives of the railroad companies Sir Thomas R. Ellis, secretary of the Mine Owners' Association, and Sir Charles G. Beale, vice-chancellor of the University of Birmingham; as representatives of the men, Arthur Henderson, Labor member of Parliament, and John Burnett, chief labor correspondent of the Board of Trade, and as the chairman of the commission Sir David Harrel, formerly Under Secretary for Ireland. The commission is authorized to investigate the working of the conciliation and arbitration agreement of 1907 and report what changes, if any, are desirable, with a view to a prompt and satisfactory settlement of differences." When the announcement was made in Parliament James MacDonald, the leader of the Labor party, assured the House that if the spirit shown on both sides in the course of the negotiations prevailed in future relations the country had heard the last of railway strikes in this day and generation, but he denounced Home Secretary Churchill for his "reckless display of military force" and said that he hoped to hear no more "of these fussy interferences by persons who do not understand the nature of the circumstances with which they are dealing, but who desire to find themselves in the newspapers day by day." Mr. Churchill, in reply, said if the authors of the strike had succeeded in their intentions they would have brought about a catastrophe compared with which the effect of a blockade by a foreign enemy would have been almost negligible, and that if the Llanelly rioters had been left to themselves they would have wrought more damage and misery in two or three hours than the whole 50,000 troops employed in strike duty. Everybody had heard, he said, that four or five persons had been killed by the military, but had not seen how many had been saved by the troops. Kier Hardie, the Socialist leader, was still more violent in his denunciation of the Government, asserting that the men shot down during the strike "were murdered in the interests of the capitalist system" and that if the Government had brought the same pressure to bear on the directors as it had on the men there would have been no strike. Mr. Lloyd-George replied that there was not a syllable of truth in the charges of Mr. Hardie and that such language was likely to fan into flame the smoldering embers of the great conflagration that had just been put out.——The railroad companies according to the terms of settlement agreed to reinstate the strikers without prejudice, but when the men went back to work they found that in many cases they could not get their former positions because men who had remained loyal to the company had been promoted to fill them. This caused hard feeling and in some places the men refused to return on these conditions.

[illegible] difficulty occurred on the municipal tramways of Liverpool, where 250 men went out in sympathy with the strikers on the railroads. The municipality discharged them, filled their places, and when the strike was called off refused to make room for them. All of the other strikers in Liverpool, some 68,000 men, declined to go back to work until the 250 tramway men were reinstated, and this for a time threatened to bring on another strike of the whole railroad system. But finally the municipal tramway committee was persuaded to agree to take back the strikers as rapidly as they were needed.——The loss to the railroads from the two days' strike is estimated at $2,500,000.

**Anti-Semitic Riots in Wales**

Great Britain has hitherto congratulated itself on its freedom from the outbreaks of anti-Semitic violence which have disgraced other European countries, but the past week has shown that it is not immune to such disturbances. In consequence of the general disorder of the strike period rioting broke out in several towns in southern Wales, which soon came to be definitely directed against the Jewish shopkeepers. The prejudice seems to have been more economic than religious, as most of the retail trade and business of the mining towns is in the hands of Hebrews, who are alleged to be extortionate in their charges for goods, especially when sold on the instalment plan, and in their rentals of houses. At Tredegar, Rhymney, Bryn Mawr, Ebbw Vale and other towns in Monmouthshire, the Jewish shops were attacked and looted. Troops were ordered to the locality and succeeded in checking further damage. Many of the Jews deserted their homes and fled with their families to Cardiff.

**Portuguese Affairs**

The new constitution of the republic, as drawn up by the first parliament, went into effect on August 25. President Theophile Braga and the other members of the Provisional Government which assumed power at the time of the overthrow of the monarchy last fall retired in favor of their successors, elected by parliament. The first constitutional President is Manoel de Arriaga, Procurator-General in the Provisional Government, who received 121 votes, while his nearest competitor, Bernado Machado, Minister of Foreign Affairs, received 86. President Arriaga is a lawyer and former professor in Coimbra University. He served as instructor in English to the late King Carlos and the Duke of Oporto, but retired from this position on account of his republican principles. He will endeavor to unite all parties in support of the Government, but it is already obvious that this task is a difficult if not an impossible one. The radical republican wing, under Alfonso Costa, Provisional Minister of Justice, are strongly opposed to the adoption of conciliatory measures, particularly any concessions to the Church. The new Government desires to pursue a policy of moderation and to revise the separation law on lines which proved so successful in Brazil, where the connection between Church and State was amicably dissolved and none of the Church property or revenues confiscated.——The strike of the cork cutters in the villages near Lisbon is assuming serious proportions, on account of the sabotage connected with it. Two factories at Villarinho were set on fire by the strikers, who would not allow the firemen to save the buildings. The troops could not be sent across the Tagus for their protection because of a strike of the dockers and lightermen.——In the north of Portugal, where the population is monarchistic and clerical in sentiment, large numbers of the men have gone over the border into Spain to join the force collecting for the invasion of the republic under Captain Paiva Couciero. The exiled King is supposed to be backing up the movement for his restoration and the Government has stopped his monthly allowance, claiming that he owes the country $10,000,000, while his property is valued at only $5,000,000. A small steamship, the "Foam Queen," loaded with arms and ammunition, presumably intended for the royalist forces, has been seized at Gravesend by the British Government.

**The Morocco Qustion**

There is some prospect that the dispute between France and Germany over Morocco, which has threatened to involve Europe in war, may be amicably settled next week. Ambassador Cambon has returned to Berlin and will resume the pourparler with the German Foreign Minister, Baron von Kiderlen-Wächter. He carries with him the final instructions of the French Government as to what concessions may be made to secure the withdrawal of Germany from Agadir. A Cabinet meeting on the 25th determined the limit to which France was willing to go to preserve peace. The calmness and firmness of French public opinion is in marked contrast to the agitation manifested in the former Moroccan crisis six years ago. Preparations for war have been actively pushed during the past weeks in both countries, and French and British warships have been dispatched to Moroccan ports. Germany seems to have abated its demand for the whole of the Atlantic portion of French Kongo and is willing to accept a strip adjoining the Kameruns, leaving to France the important port of Libreville. Germany is also thought to be willing to cede to France the northern triangle of the Kameruns, thereby withdrawing from Lake Tchad. France will doubtless not agree to any settlement that does not insure the complete withdrawal of Germany from political interference in Morocco, even in the event of the French annexation of the country. Since the Algeciras convention stipulates the independency of Morocco and the sovereignty of the Sultan, this involves the consent of the Powers signatory to that instrument, including the United States.

**Foreign Notes**

Jules Verne's "Around the World in Eight Days" has now been reduced by half thru the enterprise of the Paris *Journal*, which dispatched André Boas-Schmidt July 17 on a race against the record of "Phileas Fogg." He went westward by the shorter northern route, taking the Trans-Siberian Railroad from Moscow to Vladivostok, thence to Yokohama, where he sailed to Vancouver. Crossing the continent he took the "Olympic" at New York City, which landed him at Cherbourg, whence he was conveyed by automobile to Paris, completing the circuit of the globe in a little less than 39 days and 20 hours. His railroad and steamer tickets cost $596 and he gave away $600 in tips.——The New York *Times* sent a commercial message around the world in 16½ minutes without any special preparations in advance. The route followed by the message was overland to San Francisco, thence to Manila, via Honolulu and Midway Island, to Hongkong; Saigon, Singapore, Madras, Bombay, Aden, Suez, Alexandria, Malta, Gibraltar, Lisbon and the Azores home. The message was relayed sixteen times during its journey of 28,613 miles.——Count Katsura has resigned his position as Premier of Japan and Marquis Saionji will form a ministry in which it is expected that Baron Uchida, now Ambassador to the United States, will have the portfolio of Foreign Affairs.——The Russian Government has taken another step in its policy of the Russification of Finland by preparing a bill to be submitted to the Duma cutting off the parishes of Kivinebe and Nykirka from the Viborg Province and annexing them to the Province of St. Petersburg. The territory comprises nearly a thousand square miles and contains a population of 30,000. The Finns are greatly excited over this partition of their country and a meeting of prominent men from all parts of the Province of Viborg has been called to protest against the measure.——The strike and lockout of the metal workers of Leipzig and Thuringia has led to similar trouble in Dresden and Chemnitz, where the employers have locked out 60 per cent. of their men.——According to the official reports there were 1,612 cases of cholera and 635 deaths from the disease in Italy during the week ending August 19. The epidemic continues in Constantinople, where the deaths have ranged from thirteen to thirty-four a day.——The latest census returns give the total population of Greater London, including the area of 693 square miles within eleven miles of Charing Cross, as 7,252,963. The population of the administrative area of 1168 square miles under the London County Council is 4,522,961.

# The Constitutional Objection to the New Arbitration Treaties

BY SIMEON E. BALDWIN, LL.D.,

[illegible] of Connecticut, Ex-Chief Justice of Connecticut, Ex-President of the American Bar Association.

THE issue between the Senate Committee on Foreign Relations and the President as to the constitutionality of the pending arbitration treaties is a very narrow one. It may be stated thus: Can the Senate agree in advance to abide by the decision of some outside authority, as to whether a particular claim is justiciable in its nature?

It is unfortunate that no better word than "justiciable" (which the printers generally insist on making "justifiable") could be found to express the idea of the parties to the treaty. Few people understand its meaning without a lengthy explanation, and any explanation leads toward the borders of obscurity. The treaty tells us that one reason for holding a claim justiciable may be that its validity can be decided by applying the principles of law or equity. But what is equity, as distinguished from law?

Here, again, is a call for definitions. Does "equity" mean that branch of remedial jurisprudence which, by the old law of England, was kept distinct from what pertained to legal remedies? Certainly it cannot, in the French treaty, be intended that "equité" should be thus understood. France, and the world generally, know "equity" as that which is fair and just, tho perhaps not sanctioned or required by strict and technical rules of ordinary law. It is the *jus æqui et boni* of Roman law.

But few long documents have ever been framed in which words are not so used as to give rise to some controversy as to their precise meaning in that particular connection. A large part of the time of courts, in all countries, is taken up with determining the true construction of written papers.

It may well be anticipated that controversies will arise under these treaties as to the classes of cases which are "justiciable in their nature." How then should they be decided? In the natural course of things, such a dispute would be referred to some designated tribunal for its decision. The President and Senate could certainly agree to this, after the dispute had begun. Why should they not agree to it before the dispute arises?

It is not delegating, but rather exercising their treaty-making powers.

The Supreme Court of the United States, in 1892, made these observations, as to quite analogous action by Congress:

"It is no new thing for the law-making power, acting either through treaties made by the President and Senate, or by the more common method of acts of Congress, to submit the decision of questions, not necessarily of judicial cognizance, either to the final determination of executive officers, or to the decision of such officers in the first instance, with such opportunity for judicial review of their action as Congress may see fit to authorize or permit."*

Nearly forty years ago an Act of Congress was passed and is still in force (U. S. Revised Stat., §398) providing that

"the Postmaster-General, by and with the advice and consent of the President, may negotiate and conclude postal treaties or conventions, and may reduce or increase the rates of postage on mail-matter conveyed between the United States and foreign countries."

Here the Senate, the House of Representatives and the President concur in giving a full warrant to a Cabinet officer to conclude any treaty or convention on an important subject, on obtaining the further consent of the President, but without obtaining the further consent of the Senate. Numerous and beneficial conventions with foreign Powers rest on the foundation of this statute.

So Congress has given the President power to decide whether the legislation of a foreign country is such as fairly

*Fong Yue Ting v. United States, 149 United States Reports 649, 714.

brings it within the scope of a reciprocity tariff act, or a treaty of reciprocity.

The Supreme Court of the United States has said, in a leading case, with regard to a statute of this character, that the President's making such a decision was not legislation, nor an exercise of the treaty-making powers; but that he was acting as "the mere agent of the law-making department, to ascertain and declare the event upon which its exprest will was to take effect."*

So here, the treaty, if ratified by the Senate, would indeed authorize the Joint High Commission of Inquiry by a decision that was unanimous or nearly so, to determine absolutely whether a certain claim was or was not justiciable; but the discharge of the function by them would be simply the execution of an authority to see that the treaty is carried out, according to its true intent and meaning. The distinction is between, on the one hand, a power to make—or join in making—the law (which necessarily calls for the exercise of discretion, and a choice between different policies), and, on the other hand, acting under and pursuant to the law, that is, carrying out an authority conferred by the law-making power in order to secure the proper execution of the law.

The door to the negotiation of treaties of this class was opened wide by Congress in 1890, by a concurrent resolution requesting the President

"to invite from time to time, as fit occasions may arise, negotiations with any government with which the United States has or may have diplomatic relations, to the end that any differences or disputes arising between the two governments which cannot be adjusted by diplomatic agency may be referred to arbitration, and be peaceably adjusted by such means."

It seems ungracious for the Senate, after uniting in this overture to the world, to insist on so rigid a doctrine as to the delegation of the treaty-making power. At bottom, it is the not unnatural outgrowth of the fact that the Senate, under our constitutional system, stands for the several States, and is really a diet of deputies from different political sovereignties, meeting on a footing of equality.

It was given this position to make sure the rights of these States respectively, as against any exercise of the powers of the United States as a whole. It was not given it to reduce the treaty-making power of the United States by forbidding them either to agree in advance to what they would do in a certain event, or to agree in advance to make the decision of some independent tribunal in effect, their decision, in determining whether that event had occurred.

HARTFORD, CONN.

*Field v. Clark, 143 United States Reports, 649, 692, 694.

# To a Star

BY GEORGE KLINGLE

When I am free, fair Star, when I am free,
Shall I wing out across immensity
Where thy winged sandals go
Shall I the far stars know
When I am free?

Can it be true, O Star, that even I
Shall sing the rapture song, some by and by,
Across the plains of light,
Beyond the realm of night,
When I am free?

Can it be true that I, a waif of time,
A spirit spark breathed on a mystic clime
Clad in this clay, shall go
Midst star worlds to and fro
When I am free?

Tho there be graves, fair Star, you look upon;
Tho there be graves, aye, more than one
Of comrades, loved and lost,
Who o'er the bar have crossed
And so are free,

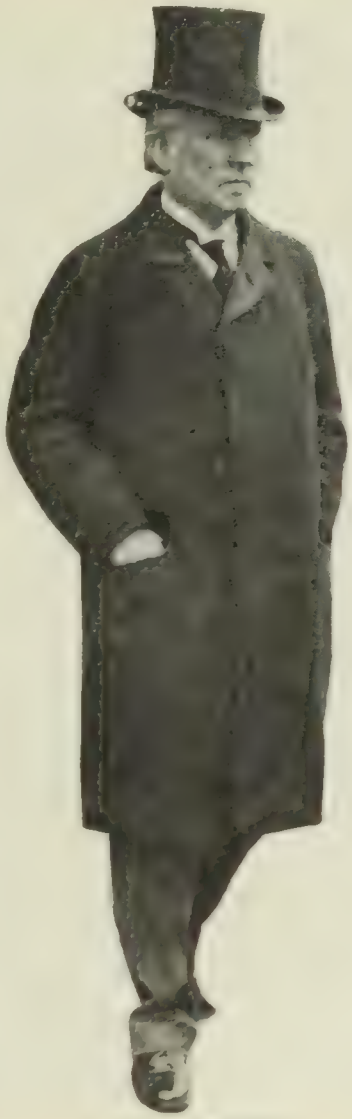
I can be glad for them tonight and dream
Of joys they find beneath the untamed beam
Of some fair world, and know
I, too, with them shall come and go
When I am free.

SUMMIT, N. J.

# Home Rule for Ireland

BY JUSTIN McCARTHY

THE peers have had the whole front of the political stage all to themselves. Yet the task imposed upon the House of Lords was not that of extinguishing altogether the hereditary chamber as a legislative assembly, but merely that of restoring it and in perpetuity to its original functions—those of exercising a controlling influence over those functions of the representative chamber which have nothing to do with the taxation of the country. It is this fact which renders the whole discussion so bewildering even to those whom long experience of parliamentary life must have made quite familiar with the functions and even the phraseology of the two Houses.



Meanwhile the Conservative party in general appear to have thought that the whole confusion gave them a convenient opportunity for returning to the leadership of Mr. Balfour. Now, it had long been my strong conviction, and it impresses me just now even more strongly than it ever did before, that in the present crisis awaiting and inciting the Conservative party the best hope they could have would be from the guidance of Mr. Balfour. I can well understand that the sturdy old Tory whose political faith is made up of chimney-corner traditions must refuse to trust himself to the absolute guidance of one who, like Mr. Balfour, is prepared to give full hearing and a patient consideration to every political claim which can be stated without actual exposure. I was at one time much in the habit of holding personal communication with Arthur Balfour when he held the office of Chief Secretary to the Lord Lieutenant of Ireland in a Tory Government and I was a member of the Irish Home Rule party under the leadership of Mr. Parnell. Balfour had official rooms of his own in the House of Commons at that time, and there I was always free to consult him on any political question which was fairly open to his official consideration.

The question submitted for the consideration of the House of Lords was what they would do with the bill which the House of Commons had passed by a very decisive majority, depriving the hereditary chamber of what I may fairly describe as all its hereditary and especially characteristic powers, and offering to join in converting itself into a second chamber, surrendering at discretion every vestige of its power of control over the legislation which owes its very existence wholly and absolutely to the will of the electing people. It was my fortune to watch the opening of this most momentous constitutional struggle, not in the capital itself, but in the great seaport of Folkestone, where one looks straight across the narrow little channel to the seaport cities of France.

The peculiar and the marvelous characteristic about this English revolution, for it cannot be described by any less emphatic phrase, is that England has invited or rather summoned the hereditary house of peers to take the leading part in making the preparations for that great change which deprives it of all positive and actual share in the government of the kingdom. Ireland, as my American readers well know already, is deeply and directly interested in this constitutional crisis. The Government of Mr. Asquith was completely pledged, as were the two latest Governments of Mr. Gladstone, to the policy of Home Rule for Ireland. I may take it for granted, therefore, that the vast majority of my American readers in the United States, and practically the whole of my American readers in the same regions, will readily assume that this is one of the considerations which gave me reason for the hope that the Conservative party would accept the leadership of Mr. Balfour during this most critical chapter of British constitutional history.

The cause of Irish Home Rule has al

ready accomplished the conversion of the great majority of the English; it is growing every day more distinctly and more admittedly to be recognized as part of the faith—I do not mean now merely of the English Liberals, but of the English people. I hold it to be perfectly evident that the struggle now forced upon the English electors, and to be resisted only by a minority of them, is a struggle for the concession of self-government to long misgoverned Ireland. Of course, I need hardly tell my American readers that the change of English opinions with regard to the rule of Ireland has not yet undergone any proclaimed exposition of faith as regards that which has always been up to this time a subject island. But the evidences are all showing themselves rapidly and unceasingly that the time is fast approaching. Many years ago I asked a distinguished Scottish Liberal why he and some of his friends who were representatives of the Scottish parliamentary party in the British House of Commons did not stand out and insist upon having a Scottish assembly of their own to manage their own affairs, and not compel themselves to lose the votes which they gave in that House on every question relating to Scotland which dealt with the interests of Scotland alone, and not of both countries alike. Then he told me that the reason he had given me was one which he thought must well justify the proceeding, the reason that the English members in their House of Commons always left the majority of Scottish members to dispose finally of every subject relating to purely Scottish national affairs, and never endeavored to secure a settlement of it by a majority of Caledonian votes. In other words, he meant to say that if the English members had endeavored to deal on the same principle with the votes of the members for Scotland as they had dealt for so many generations with the votes of Irish members, they would have found themselves compelled to deal also with so many Scottish national rebellions in succession, and if they could with success. The answer was not what one might have anticipated from so conscientious a statesman as John Bright when dealing with the cause of Ireland, but we know that at that period it was the recognized and regular practice of the British House of Commons that its members should abstain from giving any votes upon purely Scottish questions and should leave those subjects to be dealt with habitually by the votes of Scottish representatives only.

H. H. ASQUITH

I think, however, I have set forth enough to show why there should always be seen ample reason for drawing a clear and practical distinction between the claims of Ireland and the claims of Scotland for separate parliamentary rule. But I think enough has been said here to show already what a great and a deeply planted distinction is also to be made between the systems of government which would have satisfied the Scottish people and those which might once have contented the people of Ireland. We have had no Scottish rebellion during the present generation or during any recent generation, but we had a very serious Irish rebellion in 1798; another rebellion, less dangerous but as distinct and proclaimed, that led by William Smith O'Brien, a member of the Irish aristocracy and closely related to several Irish peers, and since that time the Irish people have had several movements which seemed to bring them to the very verge of rebellious disturbance. My desire is

to shew, and my duty I feel as a writer of history is to show, that Ireland has during all these years been crying out for the right of self-government. I also want to make it clear that no slighter concession could suffice for such a purpose and that those statesmen saw well into the future who saw that the way of making Ireland a peaceful and patriotic part of the British Empire must be to realize for her her own definition of Home Rule.

This is in fact the new chapter of British statesmanship toward Ireland which is being celebrated in London just now, and which will I think come to be regarded as the greatest celebration of Ireland's modern years. It comes at the present time with a singular felicity of occurrence. We inhabitants of the three kingdoms, as we are habitually called, must now look forward to a close bond of union during succeeding years, of a union which would have to be provided for by the utmost care and good will, even if we were all alike inhabitants and even born children of Ireland. Most of us know—of us Irishmen I mean—how many true and devoted friends we have found among Britons during our subjection to what is called the common rule. Whenever we are recognized as a people entitled to a separate legislature we may rely on having our legislative chamber adorned with the statues of British friends and supporters set into lifelike form before us by the art of Irish sculptors and living in the grateful hearts of Irish devoted admirers. All the peculiarities which help to give life and interest and character and merit to THE INDEPENDENT are qualities which make her more and more conformable with her title. It will not be the least one of her claims to that characteristic name if she proved to have the article especially written to commemorate the concession of Home Rule to Ireland. During the present year we have over and over again heard the announcement made, and made on the highest official authority, that Home Rule is to be the work of the present Government. It will, of course, forever rank as one of Ireland's greatest honors in history that the first Englishman who was won over in great eloquence and great statesmanship to the cause of Ireland's Home Rule was England's greatest statesman during modern times. If he did not himself live to accomplish its full success, yet at least he died bequeathing the task to his more fortunate successors, and it is that task which we now expect to see them accomplish.

LORD ROSEBERY

The former leader of the Liberals has not held ministerial office since 1894, when he laid down the Foreign Secretaryship. Since then he has held himself aloof from party strife.

To those Irishmen who like myself have lived thru the successive failures of the Young Ireland movement and all the other movements that followed for the rescue of the island from the state of mere political subjection, it must seem as if the existing indications and auguries carried with them every hope that the next chapter of our common his-

tory will be a chapter of common and genuine affection between Great Britain and Ireland. I should always like to see that Britain was conquered by the patient endurance of Ireland, by the devotion with which Ireland clung to her mission and her duty of acquiring Home Rule, and never for a moment gave way to any contention to yield to a compromise on the question of her domestic government. We have still for Ireland the second King who has been known to be in full sympathy with the Irish national claim for self-government. The first was King Edward. The present sovereign, King George, has as we know actually identified himself with the resolve of the existing English Ministry to devote their term of office to the carrying of Home Rule for Ireland along with their other statesmanlike reforms. No Irishman has ever lived during a time so full of hopeful and happy augury for his country, and it must indeed be some utterly unimaginable catastrophe which could now all of a sudden bring those seemingly certain promises to mere frustration. Ireland is living a life entirely new to her—a life bringing nothing but hope and promise. The Irish people will soon have set clearly and decisively before them the task great enough to call for the noblest qualities of the noblest race, and at the same time not beneath the capacity of any people capable of appreciating the value of freedom. The world has seen comparatively lately how Holland was able, by the mere force of resistance maintained until it had proved itself positively resistless, to set herself free forever from the mastery of Spain, and it will be a happy omen for the world in general when England, at the period of her greatest strength, is found willing and ready to grant to Ireland the gift of perpetual self-government. It will be a period, therefore, of noble men and of pride for England as well as for Ireland. We may therefore well regard the coming of the year when Ireland celebrates her accomplishment of Home Rule as one in whose triumph all peoples that love freedom may conscientiously join and the celebration of which shall be an era in their history.

[illegible], ENGLAND.

# Vardamanism

BY JOHN M. MECKLIN, Ph.D.

[Professor Mecklin, of Lafayette College, has just returned North from a protracted trip thru the South, much of his time being spent in his native State of Mississippi, where he studied the campaign of Mr. Vardaman, as a candidate for the United States Senate.—EDITOR.]

THE recent political campaign in Mississippi that will result in sending ex-Governor Vardaman to the United States Senate was, perhaps, the most bitterly contested since the famous campaign of 1875, that overthrew "carpet bag" rule, and it may well be asked whether this campaign, like that of 1875, does not mark a new era in the political history of the State. Certainly there does seem to be some necessity for explaining why a State that has honored itself by sending to the Senate such men as Lamar, Walthall, George, Money and the present worthy incumbents, Senators Williams and Percy, should now elect as its representative one who has all the hallmarks of the demagog and few or none of those of the statesman.

A study of the election returns shows that Mr. Vardaman's support in the past has not come from the intelligent and cultured planters of the Yazoo Delta, nor from the professional and business men of the towns and cities, but from the small farmers of the hill counties. They form by far the largest part of the white population of a State that has a larger agricultural element than any other State in the Union in proportion to the total of population. Mr. Vardaman, who is past master in the art of creating

sectional and class feeling, owes his political power primarily to the assiduous and successful cultivation of the prejudices of these poor whites of the hill country, sometimes contemptuously called "hill billies" or "red necks." The lack of lofty sentiment and great principles of statesmanship, by which his speeches are conspicuously characterized, is offset by appeals to the passions and prejudices of his followers and outrageous abuse of opposing candidates. His greatest talent seems to be an unlimited command of opprobrious epithets, of which he makes free use in his speeches and in his paper, *The Issue*. They are often so brutal and coarse as to forbid repetition.

In the black counties, where the land is divided into large plantations and tilled entirely by negroes, the whites are a minority, composed of the planters and their families, the managers, the keepers of the supply stores, the plantation physician, etc. They all belong to the intelligent and property-owning class; the poor white of the hills is almost unknown here. There is no friction between the whites and the blacks, since each occupies a well-defined social status which they mutually respect. In the hill counties, where the whites cultivate their small farms on the hill sides and in the creek bottoms, the situation is entirely different. From the train window one may observe these poor whites, often entire families together, working side by side with the negroes. The two races are here reduced to an economic level, where the white feels keenly the competition of the negro. He sees the children of the negro enjoying practically the same school privileges as his own children. He must also see the more thrifty of the negroes acquiring property and independence, and the unacknowledged feeling that perhaps his assumption of racial superiority which he shares with the rest of the whites is belied by the actual facts makes him a fit subject for the demagog's appeal to race prejudice.

In his earlier campaigns, Mr. Vardaman made use of this racial antagonism of the poor white and the negro with telling force. He advocated the distribution of the school fund according to actual taxation, which would have meant practically no education for the negro. To be sure, this never became law, but the moral effect of Mr. Vardaman's teachings upon the cause of negro education in the State has been noticeable in the decrease of interest in and the actual neglect of the negro schools. Another sop thrown to the prejudices of this class was Mr. Vardaman's proposed repeal of the Fourteenth and Fifteenth Amendments. It may seriously be doubted whether Mr. Vardaman ever believed this possible, and certainly it is neither deemed feasible nor is it desired by many of the intelligent whites of the State, but it served Mr. Vardaman's immediate purpose of feeding the prejudices of the poor whites and welding them together as a class under his political dictatorship. Most disastrous and dangerous of all have been Mr. Vardaman's inflammatory utterances against the negro, advocating the use of physical violence to keep him down. The writer was informed by reputable citizens of one of the counties of Central Mississippi that the lynching of negroes that took place there several years ago was traceable to an inflammatory speech made by Mr. Vardaman in that community only a short time before. He certainly has created in the minds of the property-owning and law-abiding negroes of the hill country a feeling of uneasiness, not to say of terror, lest they, together with their families and property, may fall a victim to this negro-baiting spirit instilled by Mr. Vardaman into the minds of the ignorant whites. Honest and thrifty negroes have told the writer that if they could possibly dispose of their properties they would leave the State. They do not ask for the franchise; what they do want, as one said, almost pathetically, is—peace. Many feel that practically the only thing standing between them and racial extermination is the intelligent and conservative element of the whites, and we may be thankful that these are to be found in every town and village and even upon the farms of the hill country. Words fail us when we try to express our condemnation of the demagog who thus, for the sake of selfish political aggrandizement, stirs up the racial antipathies which the true statesman should seek to allay. It is like playing with a firebrand

in a powder magazine. It has undoubtedly alienated the races in Mississippi. They are living more and more apart, and there is scarcely a point in the social order where they now meet and exchange ideas.

But Vardamanism is not identical with negro-baiting. It so happens that the small farmer of the hills, from the very nature of his position in the social order, is made to feel the onus of the negro problem more acutely, so that a demagogic appeal to his racial antipathy receives a ready response; but on the fundamental question of white supremacy the Vardamanite and the conservative do not differ. The real essence of Vardamanism appeared most clearly in the recent campaign, when the negro was dropped and a point-blank appeal was made to class feeling. Early in the campaign one of Mr. Vardaman's opponents was supposed to have alluded to the farmer following of Mr. Vardaman as "red necks" and "cattle." With all the skill of the demagog, Mr. Vardaman seized upon these epithets, and they have proved to be his best campaign material. Every means was exhausted to keep these offensive terms before the farmer. The henchmen of Mr. Vardaman have drawn him thru the towns and villages of the State with long lines of cattle, with the most farcical lack of dignity, to symbolize his championship of the human "cattle," the poor whites. On one occasion he was hauled to a political meeting by a single ox decked with flags and streamers bearing the favorite epithets "cattle," "red necks" and "low brows." He addresses his audiences as "we cattle," "we red necks" or "you bullies."

This cheap demagogery and fulsome appeal to class feeling was received with such enthusiasm as to lead us to suspect that the significance of it all lies deeper than at first appears. It is almost impossible not to see points of similarity between the triumph of Vardamanism in Mississippi and the movement in South Carolina headed by Tillman. Vardamanism, like Tillmanism, may mean the political apotheosis of the poor white. He has been long coming into his own. In ante-bellum days, fettered as he was, socially, intellectually and politically, by the institution of slavery, he followed blindly the leadership of the slave owner. During the war he took arms to perpetuate the system that was slowly but surely degrading him. It was from his ranks that the Ku Klux gained their readiest recruits in the Reconstruction period. The sufferings of this time and the long struggle for white supremacy made him loyal to the old leaders until the practical results attained under the "Mississippi plan" in 1875 were given legal sanction by the Constitution of 1890. Since then it is not hard to trace a gradual political disaffection among the poor whites of the State. It was inevitable, once the negro had been made politically innocuous, that social and economic differences should begin to threaten the political solidarity that had heretofore characterized the whites. The small farmers of the hills, differing fundamentally in their environment and interests from both the wealthy planters of the black counties and the professional and business classes of the towns, and constituting the bulk of the white citizenship of the State, must in time come to realize their power and, given a leader, seek to make themselves effective in the affairs of the State. This explains, perhaps, their amazing devotion to Mr. Vardaman, in spite of his demagogery and lack of those traits that mark the great statesman. This may explain, too, their blindness to the dark blots upon his political career and the weakness of a leader who will not meet his opponents in public debate. They are ready to excuse anything in a leader who will make them the dominant political element in the State.

EASTON, PA.

FRANCISCO LEON DE LA BARRA,
Provisional President of the Republic of Mexico

# The Present Situation in Mexico

BY LEO S. ROWE, Ph.D., LL.D.

[Professor Rowe, of the University of Pennsylvania, has had large experience in Latin-American affairs. He has been an official delegate of the United States to the Pan-American Conference in Rio de Janeiro, and to the first Pan-American Scientific Congress in Valparaiso. Last summer he was adviser to the Mexican Government in regard to the establishment of the University of Mexico. He has just returned to Mexico City again and forwards us the following article, which admirably explains the present situation there.—EDITOR.]

THE triumph of the Mexican revolutionary movement was so unexpected and took place with such bewildering rapidity that even those who were deeply interested spectators seem unable to give a clear and satisfactory explanation of the downfall of the Diaz Government. In fact, the revolutionary leaders themselves are bewildered by the rapidity with which events have moved and by the heavy responsibilities which now confront them. The feeling of uncertainty as to the future is not confined to the adherents of the old régime. Amongst the more thoughtful leaders of the revolutionary movement there exists a feeling of deep concern as to the possibility of holding in check the passions and factional feuds which recent events have engendered. Another factor which promises to be of even greater importance in adding to the difficulties of the situation is the extravagant promises with which the people have been fed. The free distribution of land, lower taxes, higher wages and lower cost of living have all been pictured to the people as the immediate result of the overthrow of the Diaz Government.

The time is now rapidly approaching when these promises must either be fulfilled, or non-fulfillment will be interpreted as a confession of failure, and will be followed by a feeling of resentment against the revolutionary leaders.

It would be difficult to imagine a more anomalous situation than that which exists as a result of the overthrow of the Diaz Administration. Under the terms of the agreement between the Govern

ment and the revolutionary leaders, Francisco Leon de la Barra was designated President, pending the new elections to be held in October. Altho occupying no official position, the offices of the revolutionary leader, Francisco I. Madero, are overrun with office seekers, for it is well known that no important appointments are made by President de la Barra without consulting Madero.

Of all the changes that are taking place as a result of the new order of things there is none more significant than the formation and rapid multiplication of political parties. During the entire period of the rule of President Diaz nothing approaching party organization existed. Many of those formed since the triumph of the revolution are merely factional groupings which are certain to disappear as soon as normal political conditions are restored. Five of the parties recently formed are likely to play a part in the approaching Presidential election.

The party which now occupies the most prominent position is known as the "Partido Constitucional Progresista," or Constitutional Progressive Party. Francisco I. Madero, the leader of the revolutionists, is the recognized head of the party. In fact, the new party was given its name in a manifesto issued by him on the 9th of July, 1910, in which he declared that in view of the triumph of the revolution, the old Anti-Reëlection party required reorganization, and as the principle of non-reelection for which the party had struggled would soon be incorporated in the national Constitution, he proposed that the new party be designated the "Progressive Constitutional party." The platform and details of party organization were entrusted to a national committee appointed by Madero.

DR. FRANCISCO V. SOUZA GOMEZ,

Secretary of Public Instruction and leader of the Anti-Reëlection Party.

The leaders of the old Anti-Reëlection party, dissatisfied with the treatment of Emilio Vasquez Gomez, brother of the candidate for the Vice-Presidency, issued a manifesto on August 10, dissolving their allegiance with Madero, and declaring Francisco Vasquez Gomez the leader of their party. This dissension in the ranks of the revolutionary party is due primarily to the fact that President de la Barra, dissatisfied with the administration of the Department of Government by Emilio Vasquez Gomez, dismissed him from the Cabinet. This step was taken in full accord with Madero and aroused the bitterest opposition on the part of the followers of the Vasquez brothers. It is altogether likely that Francisco Vasquez, instead of being a candidate for the Vice-Presidency on the Madero ticket, will be made the candidate of the Anti-Reëlection party for the Presidency.

Another recently organized party, which is not likely to play an important part in the approaching election, but which may become powerful after the country has resumed its normal condition, is known as the "Popular Evolutionist Party." The intellectual father of this party and its present leader is Jorge Vera Estanol. Recognizing the dangers of the radical changes which the revolutionary party advocates, he proposes a platform under which a new order of things will be brought about gradually. With this end in view the following platform was accepted at the organization meeting of the party, held in Mexico City on July 9, 1911:

*First.* Recognition of the political and administrative sovereignty of the States of the Union permitting the free election of State and local authorities, without intervention on

the part of the central Government. The organization of a national guard and of military zones thru the States in order to assure such sovereignty.

*Second.* The organization of a Federal legislative power thru the free election of its members, without intervention of the Federal executive.

*Third.* The complete independence of the judiciary to be accomplished by tenure for life and thru the substitution of a system of executive appointment for the present elective system.

*Fourth.* The extension of a system of popular primary education to all classes. Where such extension is not immediately possible, especially where certain of the native races are concerned, the development of a system of instruction which will include at least reading and writing, elementary arithmetic and such manual training as will contribute to the development of the agricultural, industrial and commercial advance of the localities concerned.

*Fifth.* The development of a civic spirit which shall tend to bring about closer social co-operation and thus counteract the tendencies toward anarchy and social disintegration. The gradual development of a system of obligatory military service as one of the means toward this end.

*Sixth.* The abolition of all capitation taxes and of all fiscal burdens of a purely personal character as a means of emancipating the people, and especially the native races, from the tyranny of local political bosses.

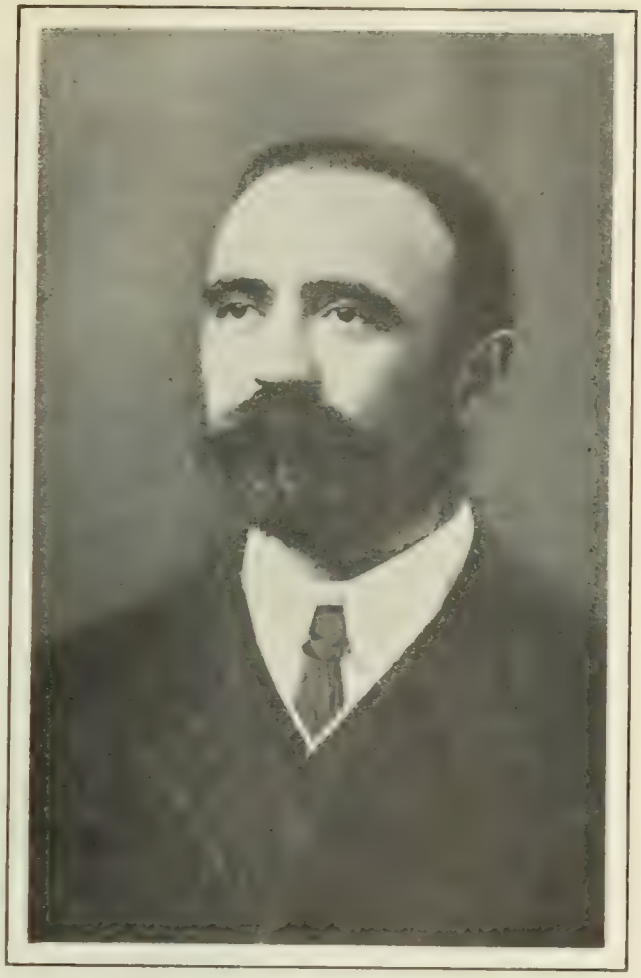
*Seventh.* The reform of the laws relating to real property and to the use of streams for irrigation purposes. These reforms should be undertken with a view to favoring the small landed proprietor and of assuring to the native races the undisturbed possession of the lands now occupied.

EMILIO AND FRANCISCO VASQUEZ GOMEZ

The former is on the right, and he it is whom President De La Barra dismissed from his Cabinet

The "Evolutionist" party has not as yet decided upon a candidate for the Presidency. This step is to be taken at a national convention to be held in Mexico City. At present the leaders of the party are endeavoring to persuade President De la Barra to be their candidate, but he has steadfastly refused to allow his name to be used.

A third party which is likely to play an important part, if not in the approaching elections, certainly in those of the next five or ten years, is the Catholic party. Altho formally organized, this party is at the present time quiescent, awaiting a clearer definition of the attitude of the leaders of the revolution toward the Church and its interests. In spite of the fact that Madero is a high degree Mason, he has received the indorsement of this party.



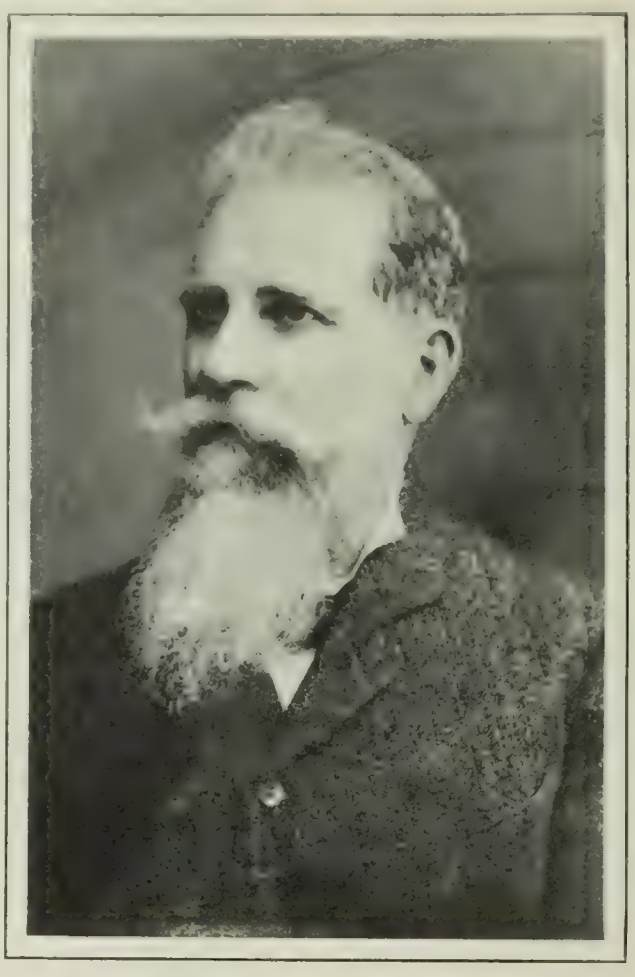
During the latter years of the administration of President Diaz there was a marked tendency to soften the rigors of the "Laws of Reform" of 1859, which confiscated the property of the Church and sought in other ways to curb its temporal power. It was generally stated that this change of policy was due to the influence of the wife of President Diaz, who is a devout Catholic. However this may be, it is certain that since 1900 there is evident a marked extension of ecclesiastical influence. Under the new order of things created by the revolution it is likely that the Church will again enter the arena of militant politics, developing a strong party, which, if not dominant in the political affairs of the country, will at least force all other parties to heed its demands.

On the 4th of August a new Presidential candidate, in the person of Gen.

Bernardo Reyes, appeared in the field. His opposition to General Diaz in 1909 led to his expulsion from the country under the polite form of a military mission to Europe. After the downfall of President Diaz the Provisional Government gave him permission to return on the express condition that he would not become a candidate for the Presidency. The agreement was that upon the accession of Madero to the Presidency he should be made Minister of War. To this agreement many of the revolutionary leaders took exception. They made no effort to conceal their dislike of Reyes and determined to eliminate him from any participation in the Government. On the 23d of July General Reyes issued a statement releasing Madero from his promise to make him Minister of War. This declaration was interpreted as the first step toward his candidacy for the Presidency. On the 4th of August he issued a manifesto to the nation announcing his candidacy.

With two avowed candidates in the field and three political parties whose candidates have not as yet been determined, the political situation has assumed a bewildering complexity. Thruout the country there is a growing body of opinion in favor of the present Acting President, Francisco L. De la Barra. In assuming the office immediately after the retirement of General Diaz, he announced that under no conditions would he become a candidate. From this decision he has refused to swerve. The remarkable ability which he has shown in the conduct of public affairs during the trying period thru which the country is now passing has strengthened the conviction in the best element of the population that he should be made the national choice in the October elections.

The interval which now remains prior to the Presidential election is fraught with many dangers to the country. The failure immediately to disband the revolutionary forces has created a feeling of uneasiness thruout the country. Clashes between the Government forces and the insurrectionists are taking place in several sections of the country. In a number of instances local revolutionary leaders have refused to recognize the author-



FRANCISCO I. MADERO
Candidate of the Progressive Constitutional Party for the Presidency

ity of the State governments and have issued decrees signed "Chief of Arms" (Jefe de Armas), which they are prepared to support by all the forces at their command.

Furthermore, the uprising has brought to the surface some of the worst elements of the population. Brigandage, from which the country suffered for many years until it was suppressed by General Diaz, has again made its appearance, altho as yet only in the most isolated sections of the country. This is probably an inevitable incident to the period of unrest thru which the country is passing. The Government is now making a vigorous effort to suppress every outbreak with much the same vigor that characterized the Diaz Administration.

Another serious danger confronting the country is involved in the widespread desire for radical and revolutionary changes in legislation. With the downfall of President Diaz discontent ex-

tematically suppressed for so many years has burst forth with such force that it threatens to carry before it some of the mainstays of social order. The Provisional Governors in some of the States have already begun to issue decrees abolishing existing laws. Thus, on June 30, 1911, the Provisional Governor of the State of Morelos issued a decree abolishing the office of "Jefe Politico," and transferring the powers of this office to the municipal authorities of the State.* It is true that in many sections of the country the "Jefes Politicos" grossly abused their powers. Nevertheless, the usefulness of this office, both in restraining the inexperienced and ofttimes visionary municipal councils, and in summarily suppressing outbreaks of lawlessness, was repeatedly demonstrated. Instead, therefore, of directing attention to the appointment of a better class of incumbents, the revolutionary leaders, in a moment of blind passion against the Diaz régime, are pursuing a course which will make the maintenance of order increasingly difficult.

GENERAL BERNARDO REYES,
Candidate of the Reyista Party for the Presidenc

In spite of all the dangers involved in the present situation, the crisis thru which Mexico is now passing possesses many of the inspiring characteristics of the opening of a new era. For a period of thirty years—almost an entire generation—political activity was systematically suppressed. The younger men of the country were denied active participation in public affairs. Suddenly, almost without warning, the gates are thrown wide open, and as a result a new civic spirit has manifested itself which, if properly directed, will be of great service to the country.

For the first time in the life of the present generation every one feels the thrill of the new political opportunities. With this civic awakening there has come a greater sensitiveness of the people to their social and economic rights. The success of so many of the recent strikes means the possibility of a higher standard of life in a class in which the standard has been lamentably low.

Furthermore, as a direct result of the revolution, the Government gives evidence of a sensitiveness to the slightest stirring of public opinion, which is something entirely new in the history of Mexico. In fact, in this closer relation between public opinion and governmental policy is to be found the real advance toward democracy which the revolution has effected.

The country is now approaching a Presidential election which promises to be the most momentous in its history. When the revolutionary leader, Francisco I. Madero, entered Mexico City early in June the belief was universal that he would be the next President. The absence of any other candidate was in many respects a happy circumstance. The country was not accustomed to orderly political agitation, and the more conservative element of the population, therefore, welcomed a situation thru which the Presidential succession would

*The "Jefe Politico" is an administrative officer the representative of the state government in the locality and appointed by the governor.

be effected without the unrest and political agitation of a real campaign.

During the last six weeks, however, the attitude toward Madero has changed considerably. Mexico is a country in which the people have been accustomed to a strong government for so long a period that they have no respect for an official, high or low, who shows the slightest indication of weakness. Personal courage and unrelenting firmness are the two qualities which appeal most strongly to the people. No one who lacks these qualities can remain a popular leader for any considerable length of time.

In dealing with the situation created by the revolution, Madero, in his desire to conciliate all factions, is gradually alienating the support of some of his strongest followers. Furthermore, new candidacies are looming up on the horizon, at least one of whom may become a serious rival for the Presidency.

To add to the difficulties of the situation, the election will be held under an antiquated and totally inadequate election law which lends itself to abuses of all kinds, and which may become the cause of serious conflicts at the polls. President Diaz, in his final message of April 1, 1911, to the Mexican Congress, called attention to the necessity of a thorogoing reform of the election laws. The downfall of the Government prevented the execution of this plan.

With political parties unorganized and with an antiquated election mechanism, the country approaches the Presidential election under conditions which are none too favorable. The greatest danger is that the defeated factions will refuse to accept the result, in which case, unless a strong President controls the situation, a long period of internal disorder may ensue.

Mexico City.

# Ecclesiastical Insurgency

BY THE REV. JOHN C. GRANBERY

[How the questions involved in the late ecclesiastical action of the Presbyterian General Assembly appear to a young minister of the Southern Methodist Church appears in this article. Mr. Granbery's father was a distinguished bishop of that Church.—Editor.]

YES, there are ecclesiastical insurgents, just as there are political insurgents, and there always have been. Every student of history knows the phenomenon of insurgency within the Church itself. The Hebrew prophets "insurged" against both Church and State. From the point of view of the priests their philippics against the efficacy of ceremonial, and their insistence upon social righteousness as constituting the heart of religion put them quite outside the circle of the holy, while their bold, defiant and universalistic attitude toward the state was sufficient to brand them as traitors. Paul was for a time a mighty insurgent, until the Jerusalem standpatters—the authorities "who," as Paul says, "were reputed to be somewhat"—lost out, and the new and more liberal type of Christianity for which Paul stood, prevailed. Luther "insurged" against Roman standpatism, and Wesley insurged against Anglican regularity.

The student of ethics or sociology knows the social meaning of insurgency. In primitive society morality is determined by custom. Now and then strong personalities arise who call in question this group or corporate morality. Of course, such persons must suffer for their audacity, but as a result of this collision progress is secured and humanity moves forward. Socrates drinks the hemlock and Jesus dies on the cross.

Let us attempt to characterize further the insurgent and the standpatter. What distinguishes the one from the other? The language is almost the same in the

political and the ecclesiastical fields. Wickersham, standpatter, cries "treason!" while the ecclesiastic calls it "heresy" and "disloyalty." Even a man of the admirable balance and sincerity of Mr. Taft is betrayed into saying "Hypocrisy!" and ecclesiastics use the same word of those who see fit to remain in the same communion with them, but differ in opinion. Ballinger calls the civic uprising "a mirage," but the ecclesiastics use much more unsympathetic and opprobrious terms of the spiritual uprising.

We ought to present the case for the standpatter and the case for the insurgent. That of the standpatter is easy, simple, plausible. As it was in the beginning, is now and ever shall be. If you can't stand by your party, your caucus, the organization, the party leaders, the traditional policy, then get out and go where you belong. If you don't like the Church of which you are a member, then join one that suits you better. Don't stay in and criticise. You may be a minister of a certain denomination. By the most solemn obligations personally and deliberately assumed you are bound to support the doctrines and polity of that communion. The moment you find you cannot consistently do that, your only honorable course is to take the proper steps to sever your connection. I heard a prominent Roman Catholic official, a handsome and earnest young Irishman, addressing a club of Catholic students in a university on "Modernism": "The Church has laid down its articles of faith," said he. "If you find that your scientific studies make it, as you say, impossible for you to accept the dogmas of the Church, then get out of the Church. You cannot be honest and remain in, and the Church will be much better off without you."

Now, what have the insurgents to say to all this? "When it is said that I betray my party, that I fight against the Republican party," cried the lamented Dolliver, "I deny it. I fight for the Republican party, and propose, with millions of other people, to do what I can to make it more than ever the servant of the great community which it has represented for so many years." Then he told how, in the Fiji Islands, a tribe was walking barefoot in single file over a difficult mountain path, their chieftain at the head. His foot slipped. Thereupon each member of the tribe fell at the place in like manner, except one man, who did not understand, and he was pounded to death as disrespectful to the chief. "The insurgents and the men who stand with them," said Gifford Pinchot, "are the Republican party."

Ministers of the communion to which I belong promise to drive away strange and erroneous doctrines, if my memory serves me, and that I have steadfastly sought to do. But there is a distinction of great importance to be made. The Jews said: "Our father is Abraham." Christ replied: "If ye were Abraham's children ye would do the works of Abraham." As St. Paul put it: "For he is not a Jew who is one outwardly; neither is that circumcision which is outward in the flesh: but he is a Jew who is one inwardly; and circumcision is that of the heart, in the spirit, not in the letter; whose praise is not of men, but of God." And again: "For they are not all Israel, that are of Israel: neither, because they are Abraham's seed, are they his children." When Prof. G. B. Foster was expelled for heresy from the Baptist Ministers' Association of Chicago, he maintained: "But I am as good a Baptist as you are. I hold to that which is great, spiritual and essential in the Baptist communion." Early Christianity distinguished between the literal and physical Israel on the one hand, and the true, spiritual Israel on the other. So to be a Republican, or to be a Democrat, today may mean different things. For example, I happen to be a Democrat in politics, but I utterly repudiate the two alleged Democratic United States Senators from this State. I do not belong in the same party with them; one or the other of us has got into the wrong crowd.

Apply the same to present day ecclesiasticisms. What is a Lutheran, an Anglican, a Methodist, or a Catholic? There are strict constructionists of the legal type, and there are liberal, prophetic souls. And I repeat that there always have been. Any Church will serve for an illustration, but suppose we take the Roman Catholic. The insurgent in that

communion is called a Modernist. In the words of one of them, the Abbé Loisy, a Modernist is one who desires "to adapt the Catholic religion to the intellectual, moral, and social needs of the present time." He is simply a child of the modern age within the Roman Catholic Church. Now those who look at Catholicism as a compact and unchanging body bound to the ancient past say that he ought to get out and "go where he belongs." But the Modernist is sure he belongs in the Roman communion, and he intends to stay where he belongs. He claims that his sympathy with the modern spirit has made him more truly Catholic, and the Church needs him and his new light. Many Protestants wonder why he does not declare himself a Protestant and unite with some branch of Protestantism. Roman Catholic authorities call him a wolf in sheep's clothing, a Protestant in disguise. Just so a Protestant liberal in one of the great evangelical denominations is criticised by the orthodox for not "being honest and getting out," for not "joining the Unitarians," and so on, while radicals on the outside wonder why they do not get out and "be free." But these Modernists feel that they are loyal, faithful, devout Catholics. They are not mere followers and imitators of liberal Protestants. They get their message directly, and by virtue of their temperament, training and associations they see and feel things differently from Protestants.

George Tyrrell, that most winsome Irish Jesuit, is a good example. He was passionately devoted to the Catholic ideal of a Christian society with its roots in the past, with its branches stretching widely in the present, with its union of persons of different nationalities and races, with its saints and thinkers, with its great art in architecture, painting, sculpture and music, with its wide range of appeal and unifying force. "The very word Catholic is music to my ears," said he. "If the Roman Church still holds me it is because, in spite of the narrow sectarian spirit that has so long oppressed her, she cannot deny her fundamental principles; because, as a fact, she stands for the oldest and wisest body of corporate Christian experience; for the closest approximation, so far attained, to the still far-distant ideals of a Catholic religion." He is chilled by Protestantism. It seems to him to feed one-half of the soul and to starve the other. As represented by its official documents and favorite spokesmen, Protestantism is committed to just that attitude toward creeds and dogmas from which the Modernists would liberate their own Church. Tyrrell compares St. Francis of Assisi with "a typical Puritan or Bible Christian," and finds the latter outwardly more in accord with the New Testament, but "St. Francis's spirit is unmeasurably truest to the spirit of Him whose consciousness of divine sonship lit up the whole world for Him with a joy that no sorrow could quench, whose delight was to be with the lilies of the field, with the birds of the air, with little children, and with the sons of men."

But how can these Modernists remain in the Church when their belief is so different? With them a dynamic conception of the universe has taken the place of the static. Development takes the place of fixity. The dualism of the natural and the supernatural is transcended. All mechanical and external revelation is abandoned. It is thru human experiance that the immanent God reveals Himself. The Bible has no infallibility or dogmatic authority; it is a record of religious experience and awakens faith in us. Of course opposition to absolutism in religion involves a repudiation of Roman Catholic ultramontanism. Can persons believing all these things be consistent Roman Catholics?

Let us see their point of view. These men are opposed to "intellectualism" in religion. We cannot arrive at the reality back of phenomena by mere rational processes. The only value of dogma is found in its practical bearing on the moral and religious life. Life and action do not wait upon knowledge. Father Tyrrell says that if theological intellectualism be right, yes, the Modernist ought to separate himself from the communion of the church. On the other hand: "No, if Catholicism be primarily a life and the church a spiritual organism in whose life we participate, and if theology be but an attempt of that life to

formulate and understand itself—an attempt which may fail wholly or in part without affecting the value and reality of the spiritual life."

The very fact that the insurgent elects to stay within the party or church brings into existence the phenomenon of insurgency. If he got out there would be no controversy. If the Modernists had recognized an incompatibility between the modern view of the world and Catholic Christianity, or if under ecclesiastical pressure they had quietly withdrawn, that would have been the end of the matter. Many do go out. So in Protestant communions, worried and harassed by petty ecclesiastical persecutions, having their life work to do and not caring for a fight, many ministers simply walk out and go into more congenial fields. For such I have no word of criticism. But if all were like them there would be no insurgency. The insurgent has a work to do within his own church or party, and altho he may not love a fight, he is willing to stick it out and fight it out. The man who steps outside is no longer an insurgent.

Jesus chose to remain. The Jewish Church was certainly narrow, and Jesus did not hesitate to point out its narrowness. Jesus went so far as to set certain great spiritual principles over against imperfect Old Testament teaching. But he was no come-outer. He felt that at heart He was at one with the Old Testament revelation. It was His mission to make full and complete—to fulfil the law and the prophets.

St. Paul had no idea either of leaving the Christian Church or of yielding the great principle of Christian liberty to the at first dominant party of Jewish-Christian literalists. He was fighting a battle for future generations. A lesser man would have compromised the cause for the sake of harmony and on grounds of expediency.

Luther had no idea at first of founding a new Church. It was forced upon him. John Wesley never wanted to establish a new denomination. Personally he never broke with the Church of England; was an ordained clergyman in it to the day of his death. He loved it, but it did not suit him in every respect. When the Methodist societies in this country were organized into a separate Church, at the close of the Revolution, he sent over the twenty-five Articles of Religion which Methodists still retain. He had eliminated from the Thirty-nine Articles of the Church of England whatever of predestination and sacramentarianism and so forth that he did not like, and made abbreviations in the interest of simplicity. In giving the American Methodists a selection of Psalms for Sunday use he remarked that some of the omitted ones were unfit for use in the mouth of a Christian congregation; he was a higher critic before the higher critics. He says:

> "I subjoined [to a sermon] a short account of Methodism, particularly insisting on the circumstances: there is no other religious society under heaven which requires nothing of men in order to their admission into it but a desire to save their souls. Look all around you, you cannot be admitted into the Church (i. e., the Church of England), or society of the Presbyterians, Anabaptists, Quakers, or any others, unless you hold the same opinions with them, and adhere to the same mode of worship. The Methodists alone do not insist on your holding this or that opinion; but they think and let think."

That is to say, the Methodists of that day. I know of two ministers who were turned out of the Methodist ministry because they had some doubt about eternal punishment. One is reminded of Alexander Campbell, who sought to unite Christendom on an undogmatic basis, but ended by founding another sect, in some places the most sectarian of all.

Of course the man who holds his ground will have to suffer, but that is of comparatively little consequence, so long as progress is secured by his fortitude. No man has a right to complain. It is an honor to be among the noble company of martyrs. The methods of punishment are everywhere practically the same. They used to burn them at the stake and subject them to physical torture. Somewhat more refined methods are now in vogue. The Pope thus addresses the bishops with reference to the Modernists: "Hence, venerable brethren, it will be your first duty to thwart such proud men, to employ them only in the lowest and obscurest offices: the higher they try to rise, the lower let them be placed." That is exactly the method of Protes-

tantism. Heresy trials are unpopular and are to be used only as a last resort. It is much simpler to keep down and in the background, in the backwoods, all young men of progressive ideas. Where there is one great and sensational heresy trial, there are literally dozens of men suppressed and squeezed. The Church exalts regularity and puts a halo about the head of mediocrity. In politics the Administration withdraws patronage and the axe swings. But persecution and suppression never finally decide anything. This world is governed by spiritual forces, and carnal weapons do not ultimately determine spiritual issues.

It is not necessary for liberally disposed Christians to leave their church, and in most instances they ought not to leave. Our churches need them. Of course questions regarding the ethics of ecclesiastical conformity and creed subscription will arise, and they are to be taken seriously. The best course is not that of denouncing and seeking to destroy dogma, but we should seek to understand it. Formulæ may seem to us dead, lifeless, and useless, but they once stood for spiritual realities, and demand on our part insight and sympathy. Every creed is but the convictions of a certain group in a certain age, stated in the thought-forms of that time. It is our business to study sympathetically these stages of development. But we shall not identify essential Christianity with any of its passing forms. Christianity is the spirit of Jesus incarnate in human lives. It is enough that we live for the ends for which He gave His life.

BARBOURSVILLE, W. VA.

# Advice of a Father to a Daughter Entering College

BY CHARLES F. THWING

PRESIDENT OF WESTERN RESERVE UNIVERSITY AND ADELBERT COLLEGE.

MY DEAR GIRL—There has never been any question about your going to college. Your mother's life at Vassar had given her a special eagerness to send her daughter to that or some other good college. But now that the college is decided upon, I can easily see that there were three, among other, reasons which have led us to make our choice.

One reason is that the college is not too big. A very big college for boys is bad, but a very big college for girls is worse. Girls, I take it, have peculiar need of individual care. They are by nature less independent. They are more inclined to go in schools or flocks. This tendency should be met by specially careful oversight of each and every one. When I think, too, of how large a part of your life and work will be individual, I am the more eager that you in your education should not be one of many. A big college, of course, you may say, should give as careful care to the individual as the small. It *should;* but it does not, and, certainly, it is more difficult, and these difficulties colleges do not seem to have the machinery for overcoming. So I am glad you are going to a college big enough for you to find a field of companionship, a variety and richness of studies, and not so big that you will be regarded by the president as one out of a thousand.

I am also glad we have decided to send you to a college near a big city, but not in it. A college for girls in a big city does not give room for play, in both the metaphorical and literal sense, and you girls must have a chance to play, to frolic, to be your free selves; but a college also far away from a big city always seems to me to make the temptation pretty strong to fall into habits of dress and manner which the world does not value highly. I want you to be urbane, and urbane is only urban with the last

vowel left off. But I also want you still to have room and space and time for play.

But there is a third reason, too, for our choice. I have not wanted to send you to a college where there are boys. I wonder if I can tell you just why I am glad. I think the reason is something of this sort. College life has many problems, and some hard ones, for the girl. They are for some girls so many and so hard that they are not able to see thru them, or to think thru them, or even to feel their way into or thru them. I do not want to add to your problems unnecessarily. The presence of boys is liable to make for some girls a problem or a series of problems. The problem which the boy represents had better be deferred for most till graduation, and it is also a problem which the parent would rather see solved under his own eyes. While I believe we ought to have co-educational colleges, and also while I believe that certain girls will find it well to go to them, I am glad you are going to a college where the boy-problem, or the man-problem, will not be presented every hour of every day, and day by day of each of your one hundred and forty-four weeks.

But now having told you, as I have not before, of some of the reasons leading to our choice, what shall I tell you of your college life? The one great thing I do want to say is: get the best for yourself from the college. That sounds very selfish, doesn't it? Well, perhaps it is—but wait a bit. And at the peril of seeming unusually selfish, let me emphasize *for yourself*. For do you know that what in college may be best for one girl may not be best for another. It may be well for one girl to give special heed to her health, thru the gymnasium and long walks and longer sleeps; for another to make most effort to overcome her self-consciousness; for another girl also to do her scholastic work with special excellence, that she may become the most efficient teacher. Let each try to find in the college the supply of her dire direct wants, and the *direness* of these wants differ. It is also plain enough that your education must educate *you*. Does not one derivation of the word indicate that this thing we call education is a drawing out, a leading out of one's inborn tendencies, a development of which the philosophers call the immute? No gardener tries to raise cabbages from cucumber seeds. Your father may wish you had more and better stuff in you, but you are what you are, and education must educate that individual which Nature out of all her material made you. Yet, despite all this, girls and boys are surprisingly alike, and all girls have largely the same needs.

Get the best for yourself, therefore I repeat.

Among the *best* for yourself are several things that I want out of my experience as college man and as your "dad" to tell you about.

One of these things I shall call appreciation. Perhaps I better call what I have in mind a love for the best, if in this big-little word of love I can put in two or three things. I want you to know what is the best, I want you then to love this best, and then I want you to make this best a part of your own dear self.

In this knowing, loving, incorporation I want first to include your teachers. Sometimes college professors say that college life would be very interesting were there no students; students might return the ball by saying college life would be all right were there no professors. But all college people know that each would be "useless without the other." Now you will find your teachers in college, like teachers in school everywhere, and like all other folks, having a great variety of ability, or even of disabilities. You are going to college with the idea, possibly, that each professor is pretty near perfection. Well, keep on thinking so till you are obliged to think otherwise; but you will soon find that they are a bit nearer perfection in certain latitudes and longitudes than in others. What I want you to do is this: Take each one at his best, and leave him as much alone as you can in his not-best. When I was a Freshman I had two teachers in Latin. With them I read Livy and Horace. One of them was a close, accurate, painstaking scholar. The chief impression I bore away from him was that the Latin language was made up largely of a thing called "the subjunctive." Well, it did me good, I am sure.

It helped to make me accurate, I presume. The other teacher helped me to feel the strength of Livy's well-knit sentences and to give me a sense of style thru the well-chosen epithets of Horace's verses. Each did a bit for me. Each did what the other could not do. Take your teachers at their better, their best, and try to forget the weak and unworthy.

I also want you to have an appreciation of the best books. You have the advantage of having been brought up in a library. Books have been so common a part of your furniture and of your home that you may be in peril of now knowing that some books are good, some better and some best. Do you recall Bacon's interpretation? I want you to know, to love, and to make you own the best books of all sorts of literature. You have read novels, many—keep on reading. But remember that Scott is more worthy than Cooper, Thackeray than Dickens, George Eliot than Thomas Hardy. You like poetry, like it more and most; but I need not tell you that Wordsworth is superior to Longfellow, Browning to Whittier, Tennyson to Lowell, Shelley to Emerson. Among books the good is often the worst enemy of the best. Cultivate the best. I must say read what you like, but let what you like be the highest of its kind today, and the highest of its kind today will lead you to a higher kind tomorrow. When I think what a love of the best books will mean to you all your life, in its companionships, its exaltations, its struggles and sorrows, I feel so glad that the chance of making this love large and real is yours.

I should like to say the same to you about music. But I cannot. The best book is always on your table. The best music you must go to hear: it is occasional. Yet hear all you can rightfully. But pictures?—yes, they may be kept before you. It is better to have good copies of great pictures than original second and third rate pictures, even if you could afford them. Have a copy of a Raphael, of a Leonardo, of a Correggio, or some other master, on the wall of your room.

But I do want you to get the best out of your college life. Almost the best thing you can do in college or out of college is to live your life—live your life truly, deeply, bravely, highly, largely. In this life are many, many things. Live each of them. I want you to have a share in all college affairs. If you are asked, as I hope and believe you will be, to join some college clubs, of course accept, but do not belong to too many of them. They won't ask you to join the Glee Club! But take a part in all college fun, parties, charades, festivities. Do your share, and more, from your time and from your purse. College life in many ways tends toward selfishness. The undergraduate activities, pranks, frivolities, and earnest, serious work, will help to keep you large and liberal.

Another best of the college is your friendships. The friendship of a boy in college means much—remember your "In Memoriam"—but I believe that the friendship of college girls may mean more. You will make friends for life and for all of life's experience. From your classmates you will choose your bridesmaids. Now, there are two things you should avoid in making friendships—narrowness and intensity. I know some girls who are seclusive; they shut themselves up in their friendships, they are exclusive; they shut other girls out. This is bad. Women are in more peril of social narrowness than men. They ought, therefore, to seek to cultivate breadth, generosity, and inclusiveness. Have many friends, "and more and more and more," as is said in "Alice in Wonderland." Narrowness leads to a more serious defect, namely, too great intensity in friendship. There is a word in use in some colleges for this type: it is "crush." Ridiculous word, isn't it, yet not quite so ridiculous as it seems, for a crush is sometimes taken too seriously, by either the crusher or the *crushee;* and it may prove to be found that, when the pressure is removed, as the pressure must finally be, that some one is, for a time, more or less hurt. I have no fear for you in either the active or the passive mood. But I now speak of it, for you some time may meet a case of such friendship, and it may be your duty to help the victim or the victimizer to recover. The best way, let me add, for making a cure, is to make the case ridiculous. Keep your friendships sane, healthful, healthy, helpful, natural. Let them be growths, like rose bushes, not

manufactures, like artificial flowers. Do not force them. I do not care if you take all the freshman year for making friends.

Did I not give counsel, with a bit of apology, that you get the best for yourself from the college? This counsel applies to friendship. But do you know the way for getting the very best friendships for yourself? Of course you do. It is to give the best of yourself. And do you know the surest way of giving the best of yourself? Why, of course—it is to find the best in the other girl. That other girl has her best and her not-best, just like you. Find that best, and help her to make that best yet better. In offering to make that best yet better, you will see and she will see, too, that what is not best is being lifted up toward the best itself. Is it not unspeakable to think that a friendship should deprave or debase? How beautiful to find friendships that lift, and enlarge, and inspire both.

But if you are to get the best out of the others, they, too, are to get the best out of you. For others to get the best out of you depends upon those others, and it also rests with you somewhat. With you the responsibility is put largely on your manners. Manners: Manners is the comparative of man, it is the superlative of woman. Good manners are important enough for man, but they are made almost too important for woman. In manners for both men and women the most important words are graciousness, considerateness. Considerateness is both the intellectual and intelligent part of thoughtfulness and thinking. It also includes the emotional part of sympathy. It stands for thinking of the other person, her rights, her conditions, her needs her achievements, and it also means having a feeling for all those rights and conditions. Graciousness is a still stronger application for considerateness; it is doing a favor, showing a kindness to those who have no special claim for such favor or kindness.

May I tell you frankly your manners are not so good as you want them to be or as they really ought to be? They are abrupt, they lack considerateness; and your words, which also are a part of manners, are liable to be supercilious and superficially critical. To speak very frankly, you are not gracious. Good manners are a fine art; the fine arts are designed to give pleasure. There is such a big part of the good and the best in you that I am eager for other folks beside your family to share in it. Your considerateness of them, your graciousness toward them, will enable you to get the best. It is largely on your part a mood, a mood which you can cultivate, a point of view to which you will some time normally and naturally take.

But besides the general interpretation of these special things which will help people to get the best from you are one or two other details. One is, your voice. Your voice is not bad, but it should be positively good. It should give pleasure to one who hears it. You need not fear being too much unlike your fellow-countrymen if your voice is sweet and even. Oh, the *Vox Americana!* Take every means which the college offers for making your voice pleasant.

Another special thing which indicates considerateness is a good handwriting. I do not know as it is a function of a college to teach you writing. The fact is that probably the president of your college writes a very bad hand. I know that one great cause of your and most folks' bad writing is the examination paper and note taking, which must be done quickly. But remember there are two undesirable things in undesirable penmanship; illegibility and uncouthness. Some writing may be illegible and still be the writing of a lady or a gentleman. Some writing may be uncouth, but legible. Too much writing is both illegible and uncouth. It is important that your writing should be easy to read and pleasant to look at.

All this is very personal, but I am going to be still more so. Dress?—yes, your dad is interested in your being well dressed. The impression which you make on others depends largely upon the way you are dressed. Dress makes the man, and makes more of the woman. Good dressing need not be expensive; good dressing is dressing in good taste, and good taste is more a matter of judgment than of purse. Good dressing is being so dressed that no one can tell, half an hour after meeting you, how you were dressed, so complete was the fitness of

the habit to the habitation. Like the best window glass, dress should never call attention to itself. *Sed satis.* Perhaps even a father should venture no further upon such feminine ground.

Now these three things, voice, writing and dress, are, in part, at least, under your own control. Make them each such that they shall give forth the best of yourself to your many friends. You are going to college, not to a finishing school. The finishing school does look after this trinity of graces; the college is in peril of not looking after it. It is liable to regard such externalities as unworthy of notice. I am inclined to think that the college should have regard for such things. I believe I will so write to your college president. But perhaps the reason the college does not take notice is that it believes you are so mature, so wise, that you are able to look after these things yourself. For your education is to make you a thinker, and a person who thinks should be able to look after such things. I cannot better close this part of my letter than by giving you what Matthew Arnold says in the preface to his "Mixed Essays" about the powers which contribute to the building up of human civilization. They are the power of conduct, the power of social life and manners, the power of intellect and knowledge, the power of beauty. Here are the conditions of civilization, the claimants which a man must satisfy before he can be humanized.

I want to say one thing more. It is perhaps the most important, as it is the most serious, of all I have tried to write. Dear girl, get the best and most out of your religion. You are religious, I know, not only by formal act, but by the instincts of your nature. Religion is the greatest thing, one might say, the only thing. The relation which one bears to the Supreme Being is the most important. It is the background of life, the sky of destiny. Now so many people do not get much out of their religion, and religion certainly does not get much out of them. I want you to get much and to give much. Interpret life in the terms of the personal creator; sympathize with life in terms of righteousness; will life as a personal good.

In this interpretation of life I want to suggest to you three things as helps: First, prayer. Emerson somewhere says that every man must pray. The mood of the prayer and the act of prayer belong to the devout soul. Second, the church. Keep up your church life. I have reason to know how poor and unworthy the church is, how stupid much preaching is, but make the service of the church worship even if you cannot make it instruction or inspiration. Third, Sunday. Many college boys and girls study Sunday. It is very foolish; they think they have to. Their belief arises from a lack of forethought or prudent planning. Use Sunday for a time of interpretation, reflection, inspiration. Make each one like George Herbert's day, a bridal of the earth and sky.

Dear girl, be happy in your college life. You are happy by nature; college is happiness, you will be happy; and your happiness will be the happiness of

YOUR FATHER.

CLEVELAND, OHIO.

# Publicity for a State

BY CHARLES MOREAU HARGER

To the average citizen, his school geography lessons dimmed by the cares and duties of mature years, the name of a State may suggest hazily a blue or yellow spot somewhere on the map of the continent, or it may be recognized as a definite area notable for positive accomplishments. It depends on the information he has assimilated. Kansas has been for twenty years working toward the establishment of the latter impression on the world's reading public. It has systematically conducted an unique campaign of publicity calculated to connect its accomplishments and possibilities with its name, and to counteract and correct some erroneous ideas excited by its somewhat spectacular history.

The other day a metropolitan paper said editorially: "A hen in South Carolina is reported to lay two eggs a day. Impossible! If there is such a hen it must be in Kansas." Unconsciously the editor paid tribute to Kansas's advertising.

Given a basis in actual production—and every State has some lines of endeavor in which it excels—publicity is needed to realize dividends in capital and population. Kansas commenced advertising before the modern ideas of exploitation were discovered, before the publicity expert became a part of business life. It has excelled in the effectiveness of its efforts, both in the grouping of facts and in the presentation of startling truths, attracting attention when other commonwealths with claims also to notable achievement failed to interest the public.

For instance: At the end of 1910, the agricultural department issued its annual statement. It opened with the staggering figures of $539,739,034 as the value of farm products and live stock. Then was enumerated the wheat, corn, and animals slaughtered, these three alone making $207,565,404 return to the million and a half dwellers in the State. The stupendous totals give an overpowering sense of Kansas's greatness, making it shine as a particular star in the galaxy of commonwealths.

About the same time Missouri issued its summary of the crop season. It began with the doleful announcement: "The total value of farm crops raised this year is $199,000,000, or $10,000,000 less than last season." After this depressing prelude, which prepares one for news that the people are on the road to the poor house, comes modestly the value of the corn crop, $108,000,000—or $32,000,000 more than that of Kansas! Many of the great products of the rich State are ignored in the report or passed with mere mention, and the effect of the whole is apologetic rather than enthusing.

Such is the difference. Soil, climate and genius have promoted Kansas. The soil and climate have made possible notable accomplishment in raising staple farm crops. The genius is F. D. Coburn, secretary of the State Board of Agriculture, thru whose hands go all the facts concerning the State's production. He has been at it eighteen years and has a peculiar gift for putting the best foot forward. He likes his place so well that he declined an appointment as United States Senator to hold it. His optimism exalts the goodness and overlooks the failures. Thru no other agent does the State advertise directly. It spends thus about $17,000 annually. What is done with it?

The secretary and the assistant secretary, J. C. Mohler, with two or three clerks, have offices in the State House. Their business is to collect information regarding crops and to disseminate it. For this latter service are employed many mediums.

Most expensive and most pretentious is the biennial report, containing statistics regarding each of the 105 counties' progress. This has grown to a volume of 1,000 to 1,500 pages, packed full of reports on various methods of advanced farming as well as of figures gathered from the county assessors' reports.

Twenty thousand of these are distributed, mostly to residents of the State, but they are sent world wide, from Alaska to South Africa. It costs $10,000 to $14,000 each edition.

Many copies go to prominent papers, and such editorial mention as this in a New York paper results. "Sonnets on hens, herbs and hogs, odes on alfalfa and dithyrambs on Kansas men and women, are contained in the thousand-page biennial report of the Kansas State Board of Agriculture. A document full of hog and human nature, more fascinating than any work of fiction, it is infinitely different from the academic dullness expected from an agricultural board, and suggests an uplifted condition of the Kansas farmer that leaves nothing to be desired."

Every three months are issued 15,000 quarterly reports containing the papers read before the agricultural society and articles and information regarding certain farm methods of direct interest. These go to a much wider constituency, and, because they have valuable first-hand information, are in demand by Western farmers generally. In each is a boost for Kansas and its possibilities, adding to the advertising value an appeal to come to the State.

Mimeographic copies of short articles about Kansas agriculture are sent weekly to dailies in the pricipal cities of the country and to all the agricultural weeklies. These are furnished without cost to the recipients, postage excepted, and most of them are used. This, of itself, secures a vast amount of attention to the State as a crop-producing section.

In the secretary's office is a list of over 10,000 names, many of which are of Kansans, but including those of farmers of prominence all thru the Eastern States, to which matter of all sorts is mailed at intervals. This includes reports, booklets and cards as well as the frequent press reports of crop conditions during the growing season.

Secretary Coburn does not believe in "release dates" for news. No matter

F. D. COBURN AND SOME OF HIS AGRICULTURAL REPORTS
Some of these are issued biennially, most of them are quarterlies

how keen is the desire for information or how insistent the demand of the newspapers, all have the same chance. He mails his reports when they are ready—and all are mailed at once and are released for publication on receipt. It may be that the afternoon papers will "scoop" their rivals, or the matter may not be in the office until after they go to press. He plays no favorites.

Particularly striking is a service entirely outside the routine and some of it paid for by the secretary himself. This is a series of cards and booklets, each emphasizing one feature of Kansas crop raising. "The Corns That Kansas Farmers Have" is the title of one, and it shouts, "In Corn Kansas Is a Billionaire! In Twenty Years It Has Produced 2,957,122,161 Bushels, Worth $821,000,000. It Is the Monarch Cereal and Prosperity's Barometer." "Alfalfa's Affinity" is another—and of course the reference is to Kansas soil.

A striking card is entitled "A Difference in Corns." It shows a row of short, half-filled nubbins and a trio of big, handsome ears with the legend:

"If yours are like those on the right you are likely to be left."

"If those on the left, you are right."

On the back of the Board of Agriculture's envelopes, in facsimile of Secretary Coburn's chirography, are such messages as these:

"Did you notice it? Uncle Sam's report says Kansas raised in 1901 more than one-thirtieth of all the wheat in the world!"

"In 1903, Kansas raised one-seventh of the wheat crop of the United States."

"All the world talks about the great wheat crops of Kansas, but wheat is not our foremost product.

"The wheat makes us famous, but it is our *corn* that makes us *wealthy.*"

Little wonder that when a letter was started in New York a few days ago, addressed "To the Man Who Made Kansas Famous, Topeka," it went straight to Secretary Coburn, as intended.

Probably no one feature of the Board's advertising is so widely read and discussed as its 10,000 holiday cards, sent out each year. These are 6 by 7 inches, with a ribbon hanger. On one side is a condensed statement of the crop production of the State for the past season, with some totals for a decade or a comparison with previous seasons. On the reverse is some striking design. Once it was a fac-simile quotation from a classic essay by the Kansas master of prose, John James Ingalls, beginning, "The grassy quadrangle . . . which geographers call Kansas." Again it was some pictures of babies with the legend, "The Race Suicide Problem as Dealt with in Kansas." One of the earliest was a panel reading:

"Kansas—Did you notice it? Uncle Sam's Year Book for 1901 says that Kansas raised in that year almost 24 per cent. more wheat than any State in the Union. Did you absorb it? Uncle Sam's Year Book says that in the five years ending with 1900, the wheat and corn raised by Kansas was worth more by nearly $17,000,000 than that of any other State, while Iowa ranked third, Missouri third and Ohio seventh. Whosoever will may come!"

With the coming of prosperity in more striking prominence appeared on the card a handsomely gowned young woman and this letter in fac-similie of a girl's writing:

"DEAR MARGUERITE—This year's fourth cutting of our alfalfa was so heavy and brought such a good price that Pa says I must have a new auto, a grand piano, or take a trip around the world. Which would you do?

GLADYS.

"The Zephyrs, Paradise, Kansas, November 30, 1907."

As an appeal to feminine readers this was one message:

Cedar Rapids, Iowa.

"DEAR MRS. KANSAS—This is to tell you how much you have done for me. I was unable to stand alone, or walk a step without assistance. I could take no solid food; my only diet was a few spoonfuls of milk, and at night my sleep was irregular. I was induced to try your Balmy Air prescription, along with your Vegetable and Cereal Food preparations, and now, after one month, I sleep well, and, as my photograph shows, am stronger than ever before, and can walk anywhere without help. I recommend your treatment to all persons of my age, and especially ladies.

"Yours for health,

GERTRUDE."

Then there was a pyramid, each step a year, with Kansas's wheat yield showing the greatest of any State in the Union four years out of six. Following it was a panel with comparisons favorable to Kansas in wheat and corn, ending with, "Whosoever will may come."

They vary from year to year, and each is interesting and timely. These cards are sent broadcast to every paper and magazine of prominence in the country, and will be found hanging over many

editorial desks because of their novelty and attractiveness.

All this is outside of Mr. Coburn's writing on agricultural topics for farm papers and magazines, of which he does a great deal, each contribution affording publicity of the best kind.

The results of advertising are not always directly traceable, but often is there definite accomplishment. Thousands of letters of inquiry reach the secretary's desk. They come largely from farmers in Iowa, Illinois, Wisconsin and other States of the Middle States. They ask about the chance for a new settler, the prices of land, the best place to locate. Always they request more literature about Kansas. Once interested, there is a large presumption that the next homeseekers' excursion will bring the writer on a tour of inspection. Foreign officials write asking for reports and occasionally a prospective immigrant from over-seas pleads for more light on the possibilities of the "American Desert."

An influential by-product is in the advertising of firms, banks and municipalities of the State, which include quotations from the society's literature.

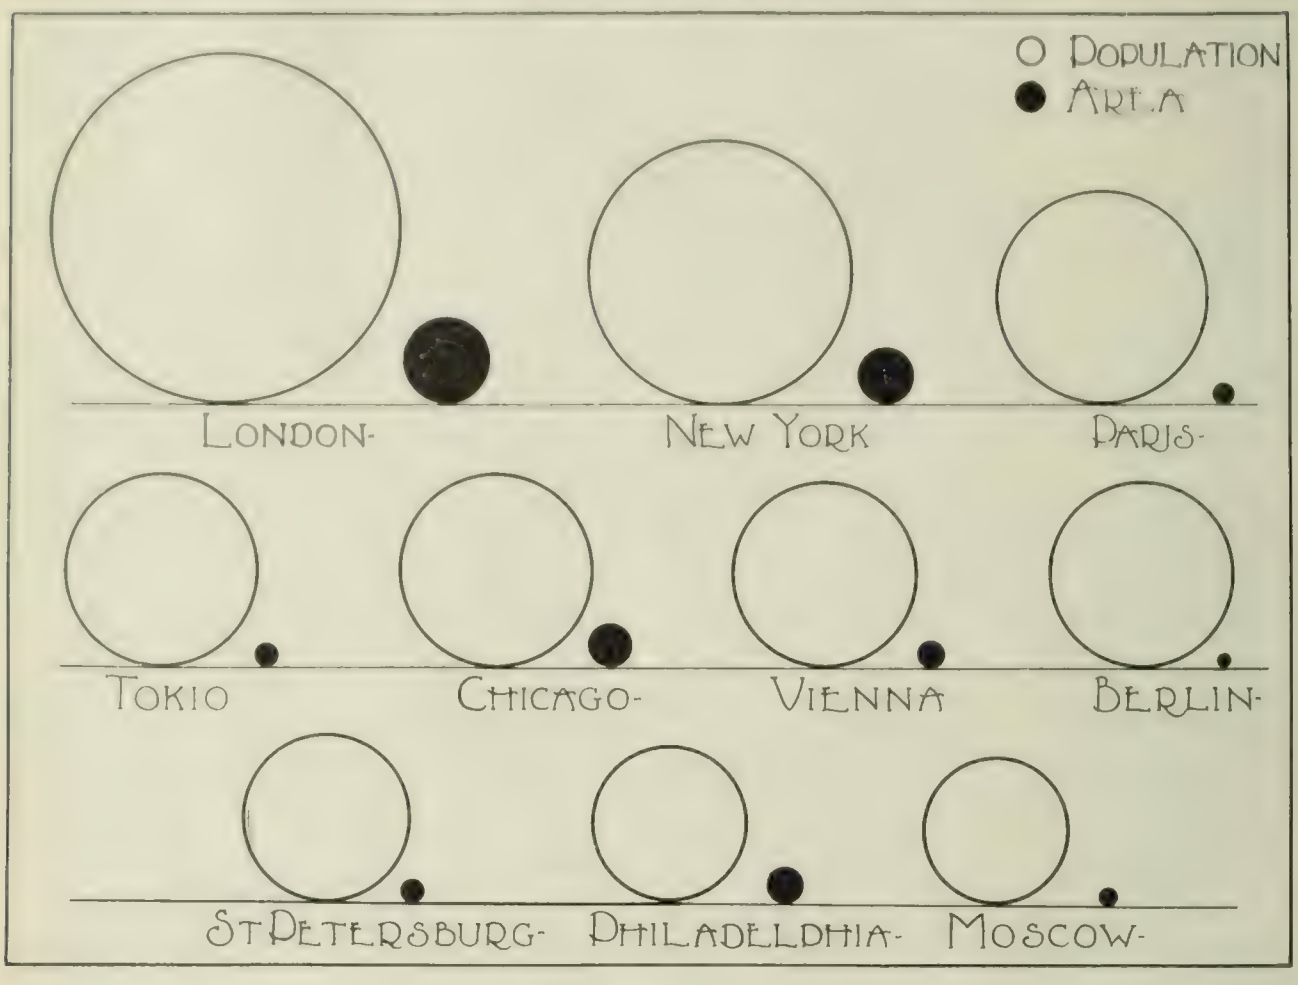
Out of it all has been crystallized a sentiment that Kansas soil is marvelously productive, that its farming methods are progressive, and that it offers opportunities for prosperous agriculture. It has convinced the Eastern investor that he can safely buy Kansas real estate mortgages; it has energized the reserve cities toward securing the deposits of Kansas banks; it has brought to the State writers for the press and has produced magazine articles and newspaper stories that teem with enthusiasm. The authors make their first visit to the secretary's office and from Mr. Coburn secure the facts and figures on which to base their contributions.

The more direct and definite effect has been on the restless farm population of the Middle States—such older settled commonwealth as Illinois, Indiana and Wisconsin. There land is high, and based on its value the income is not large. The farmer with a growing family seeks a location where with equal advantages in home life he can secure more land. His "figuring" takes some such form as this: "My 100-acre farm is worth $15,000. With that money I can buy 200 or 300 acres farther west, as good soil and with proper tillage as productive. Where shall I go?"

Naturally he turns to the statistics and reports and selects the locality that can present the best argument. So States vie with each other, land dealers overwhelm him with real estate prospectuses, railway companies deluge him with booklets. Lecturers travel from town to town with maps, moving pictures and stereopticon exhibits, endeavoring to convince him of the opportunities offered. His confidence is strongest, however, in official records, and when he receives a bulletin stamped with authority it ranks above those which he suspects of prejudice or financial motive. So the State publications receive a consideration others fail to obtain and he is induced to investigate—which in the end means usually the moving of his family to a new home. This is the strength of persistent, effective State advertising, and its value has been demonstrated in thousands of instances.

Has Kansas's publicity campaign been worth its cost?

In its pioneer period the State was handicapped by failures and disappointments. It was derided as an investment field and had to overcome a prejudice affecting influential factors in development. Yet despite these trials of earlier years, when settlement was new and farmers had not been educated in methods adapted to soil and climatic conditions, Kansas gained in population in the past decade 15 per cent. Nebraska gained 11.8 per cent. Missouri gained 6 per cent. Iowa lost .3 per cent. Conditions were similar in all this group of States.



If advertising pays business men or a municipality, why not a State? Every added family means larger sale for products, greater business for railroads, more wages for employees, higher prices for land, and increasing activity for towns and cities. But for its publicity department the success attending Kansas agriculture would today be dimly understood instead of being noted from coast to coast. Wealth and population have followed the heralding of its accomplishments. Kansas believes it has paid.

COLLEGE, KANSAS

# Ten Great Cities

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Economics in Yale University.

THERE are at present ten cities in the world with a population of over 1,000,000. Of these, three are in the United States. Russia is the only other country to have more than one city of this size.

London leads with a population of over 7,000,000; but its area is over 440,000 acres. The area of Greater New York is less than half that of London. If New York City could annex enough of its suburbs to make its area equal to that of London, it would at present have a population of over 6,000,000. Even without annexing any more territory, New York may, within twenty years, become the greatest city in the world. If it were possible to include suburbs, as has been done by London, it might become the leader within ten years. The area of Registration London, not including the outer ring, is 74,839 acres. On this territory is found a population of nearly 5,000,000, but within the past decade the population of the old city of London has actually decreased. Business is crowding residences from the center.

Berlin has recently annexed suburbs with a population of nearly 1,000,000. It seems likely that when figures are available it will be discovered that Berlin has displaced Paris as the third city in the world. The following are the population and area of the ten largest cities in the world at the latest date for which figures are available:

| City. | Area in Acres. | Population |
|---|---|---|
| London | 441,600 | 7,252,963 |
| New York | 209,218 | 4,766,883 |
| Paris | 19,280 | 2,763,393 |
| Tokio | 27,080 | 2,186,079 |
| Chicago | 117,447 | 2,185,283 |
| Vienna | 30,689 | 2,085,888 |
| Berlin | 15,098 | 2,070,695 |
| St. Petersburg | 22,091 | 1,678,000 |
| Philadelphia | 81,828 | 1,549,008 |
| Moscow | 17,054 | 1,359,254 |

New Haven, Conn.

# Literature

## Browning

Robert Browning, whom an increasing number of admirers delight to proclaim the noblest singer of the great Victorian choir and the master poet of his time, as he is easily the most voluminous English poet since Shakespeare, has been also the subject of more writing by other hands than any other English poet except Shakespeare. And this is not surprising, for he sang new songs in a new way; he wrote (too often for the early growth of his reputation) of difficult and recondite subjects, providing vast material for literary discussion; and, nobly beautiful and joyous forever as are many of his works, the life he lived was as nobly beautiful a poem as any that he wrote. Half a score of *Lives* of the poet have been published, varying in length and scope from the authoritative two-volume "Life and Letters of Robert Browning," by Mrs. Sutherland Orr, who had the advantage of a close friendship with Browning, to Mr. Arthur Waugh's charmingly written little account in the coat-pocket series of "Westminster Biographies." Yet there is room and welcome for another that so abundantly justifies itself as does the recently published *Life* by two English students and lovers of Browning's poetry.*
